CHEMICAL TRADE JOURNAL

AND

CHEMICAL ENGINEER.

No. 1676.

LONDON, SATURDAY, JULY 5, 1919.

VOL. LXV.

CONTENTS.

PAGE	PAGE
Current Topics:—	Imports of Chemicals and Allied Products
Alcohol for Power Purposes. 1	Reports of Companies
Chemical Engineers and Gas Production	New Companies
Importation of Chemicals	Trade Inquiries
Chemical Plant Control	Fertiliser News
Estimation of Zinc as Sulphide	South Wales Notes
Conjoint Board of Scientific Societies	The Patent List:—
Spontaneous Combustion of Chemical Products	Applications for British Letters Patents
National Union of Scientific Workers	Complete Specifications Accepted
South African Soap Industry	Abstracts of Latest Complete Specifications
Cumberland Coking & By-product Industries	Gazette News
Obituary	Dividends
American Notes	Market Reports:—
Society of Glass Technology	Tar and Ammonia Products
News from the Antipodes	Fertiliser Materials
Legal Intelligence	London Metal Market
French Chemical Tariff	Manchester Chemical Market
British Association of Chemists	Swansea Market Report
Parliamentary News	Turpentine Market Report
Our Book Shelf	Liverpool Chemical Market
Items of Interest	Tyne Chemical Report
	West of Scotland Chemicals
	Imports of Chemical Products
	Exports of Chemical Products
	Prices Current

EDITORIAL NOTICES.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than Wednesday morning.

CURRENT TOPICS.

ALCOHOL FOR POWER PURPOSES.

THE report of the Inter-Departmental Committee on Alcohol Motor Fuel, appointed in October last with the late Sir Boverton Redwood, Bart., as chairman, was issued on Monday. The Committee was appointed to consider: (1) The various available sources of supply of alcohol, the methods of manufacture, and the cost of the products; (2) the suitability of alcohol, either alone or in admixture with solid, liquid, or gaseous combustible substances, for use in internal-combustion engines, and the modification of the existing types of such engines which may be necessary to the attainment of efficiency; (3) the question of denaturing the alcohol, and the alterations to be made in the present Excise arrangements. In compiling the report, the Committee adopt as a jumping-off place the conclusion of a previous Departmental Committee whose report was published in 1905. The latter body was appointed primarily to consider the question of industrial alcohol in relation to its use in the arts and manufactures, and consequently the question of its employment as a motor-fuel was dealt with more or less perfunctorily. As, however, at that time the demand for motor-fuel was little more than in its infancy, and easily supplied by imported petrol at a price which put substitutes out of court, the summary dismissal of alcohol for such purposes occasioned little concern. Owing to the enormous increase in the world's consumption of petrol during the past decade, and the accompanying increase in the selling price, the question of providing efficient substitutes has assumed a totally different aspect, and this the present Committee rightly emphasise. The report is surprisingly brief, but the Committee's con-

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the Chemical Trade Journal and Chemical Engineer—payable in advance,—including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers)	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.
Our Manchester Address is Barton House, 66, Deansgate.

NEW ARRANGEMENTS.

The "Chemical Trade Journal" will be published in future a day earlier.

SUBSCRIBERS to whom the Journal is posted direct will therefore receive it each week on Friday.

451423

clusions and recommendations are to the point. Research work on the behaviour of the various types of alcohol-mixture vapours under varying conditions is in progress, and commercial-scale trials of alcohol-benzole and alcohol-benzole-petrol mixtures, to extend over a period of six months, are proceeding. The results will, of course, have an important practical bearing upon the matter, and will be awaited with a considerable amount of interest. In the course of their inquiry, the Committee considered the practicability of producing alcohol synthetically, by first extracting ethylene from coal and coke-oven gas, and converting this into ethyl alcohol. This is regarded as an important potential source of power-alcohol available in this country, though it is pointed out that further investigations are necessary before definite figures as to quantities and price can be given. Vegetable sources of alcohol naturally have received very close attention, and molasses, mahua flowers, maize and other cereals, and peat are favourably regarded as affording ample scope for further utilisation. On account of their comparatively poor yields of alcohol, the commercial use of potatoes, sugar-beet, and mangold crops is not considered practicable except under a system of State subvention. The Committee are of opinion, however, that so far as vegetable sources of raw material for the manufacture of power alcohol are concerned reliance must be placed mainly, if not entirely, on increased production in tropical and sub-tropical countries. Commenting upon the effect of denaturing alcohol on the price of the product, the Committee state that since the denaturing process now in use admittedly increases the cost, sometimes by as much as sixpence per gallon, the increase should be restricted as much as possible by reducing the proportion of the principal denaturant, wood-naphtha. In all cases of approved use for power or traction purposes, where the user gives bond, the proportion of wood-naphtha in the power alcohol might be substantially diminished, the difference being made up, wholly or partially, by petrol, benzole, or other nauseous substance, supplemented by a small quantity of methyl violet as colouring, but in their opinion a further deterrent can be provided by the imposition of much heavier penalties than those now sanctioned by law for evasion of the spirits duty in any case of illicit purification of power alcohol to render it potable. They further recommend that every effort should be made to provide a denaturant or alternative denaturants—*e.g.*, formaldehyde, pyridine, and tobacco oil,—the employment of which would be effective in the smallest possible quantities and at the lowest possible cost per gallon of power alcohol. Other recommendations of an essentially practical nature relate to the provision of adequate storage facilities at the ports of arrival for power alcohol shipped from abroad; the employment of tank-wagons for inland transportation; and the exemption from excise and import duties respectively of home-produced and imported power alcohol. Finally, the Committee recommend that an organisation should be established by the Government to initiate and supervise experimental and practical development work, at home and overseas, on the production and utilisation of power alcohol, and to report from time to time for public information on all scientific, technical, and economic problems connected therewith. This organisation should be permanent, have at its disposal the funds necessary for its investigations, be in close relation with the various Governments of the Empire, and be so constituted as to be able to deal with alcohol in conjunction with other fuels which are or may become available as a source of power.

CHEMICAL ENGINEERS AND GAS PRODUCTION.

THE works of the Birmingham Gas Department were visited on Friday of last week by the members of the Society of Chemical Industry (Birmingham and Midland section). Dr. Morrell (chairman), with a large and representative attendance of chemists and chemical engineers, attended.

The magnitude of the operations and the introduction of end producers on ranges of seven-ton retorts at the Windsor Street Gas Works greatly interested the visitors. Interest centred too on a 20-ton per day dehydrating plant, on which prepared tar is made for the Birmingham roads; a cyanide plant (Williams' process) capable of dealing with 10 million c.f. of gas per day, containing $3\frac{1}{2}$ lb. of ammonium and sulphur cyanide, and having an efficiency of 90%; and the continuous working Woodall-Duckham's vertical retort. The last of the horizontal retorts are being dismantled. In 1912 the department installed two ranges of 5-ton retorts, and these proved eminently successful. During the war a further range of 5-ton retorts were installed, as well as a range of 7-ton retorts with end producers, and two further ranges of 5-ton retorts are in course of construction. The waste gases from each of the new ranges are passed through waste heat boilers of the Babcock-Wilcox multitubular type. There appears to be no difficulty in evaporating 7,000 lbs. per hour per boiler through each range of retorts. Steaming on the retorts is in full operation and it is found that under normal conditions the make of gas per ton of coal may be increased to about 17,000 c.f. The yield of ammonia and tar is also increased. Seven-ton retorts are not novel to Birmingham, though only one other works possess them. These large retorts (7 tons of coal through each per day) are working with great smoothness, and, but for the war, the extensions would have all been seven ton retorts. With the new use of end producers the gas is distributed to each of the beds of retorts, thus effecting great administrative economies.

Dr. Morrell (Wolverhampton), the chairman of the Birmingham section, warmly thanked Dr. A. W. Smith, the chief chemist at the gas works, and Mr. J. Foster and Mr. G. C. Pearson, engineer and works engineer respectively, for the arrangements for the visit.

On Thursday the Saltley Gas Works of the Birmingham Corporation were visited by the members of the Chemical Society of the University of Birmingham. The main point of interest was a new test installation of vertical retorts which are nearing completion, and built for the chief chemist with a view of improving on existing systems from the point of view of steaming and "put through." In the scientific gas world these features are of more than ordinary interest, and are the result largely of scientific co-ordination on the part of chemists and engineers.

IMPORTATION OF CHEMICALS.

A PROCLAMATION, dated June 25, has been issued under Section 43 of the Customs Consolidation Act, 1876, of which the following is the operative part:—"As from and after the date hereof, subject as hereinafter provided, the importation into the United Kingdom of the following articles is hereby prohibited, viz.:—Chemicals of all descriptions; scientific, mathematical, and optical instruments; tungsten powder and ferro-tungsten. Provided always, and it is hereby declared, that this prohibition shall not apply to any such goods which are imported under licence given by or on behalf of the Board of Trade, and subject to the provisions and conditions of such licence.

"This Proclamation may be cited as the Prohibition of Import (No. 32) Proclamation, 1919."

The Board of Trade give notice that whereas the above proclamation prohibits, *inter alia*, the importation of all chemicals, the terms of the prohibition have been thus widely drawn solely for convenience of administration, and that it is not the intention at present to do more than to control the entry into the United Kingdom of certain classes of chemicals of a high degree of purity. The Department of Import Restrictions will therefore almost immediately issue general licences for a large number of chemicals which are not of this description, and they will also issue licences in suitable cases and for limited quantities of the chemicals which are retained under control. For this purpose the Department will be assisted by a committee which is now in process of formation, and which will contain representatives of official, scientific, and trade bodies connected with the chemical industry.

CHEMICAL PLANT CONTROL.

THE DRAIN TEST.

(FROM A CORRESPONDENT.)

"I often say that if you can measure that of which you speak, and can express it by a number, you know something of your subject; but if you cannot measure it, your knowledge is meagre and unsatisfactory."—Lord Kelvin.

I SINCERELY hope that Dr. J. W. Mellor, of "refractory" fame, will forgive me. The other day I was perusing his admirable volume, "Modern Inorganic Chemistry," when the above quotation fixed my attention. Only the same morning an important leakage of acid, previously unnoticed, had been located through following up the chain of circumstantial evidence afforded by a highly acid drain test, and the question came to my mind, "How many acid plant managers know, even approximately, the amount of their product that is weekly, even daily, passing to the drains through leaks, minor accidents, careless cleaning down, or other causes?"

And it is not to acid plant managers alone that the plant effluent is important. On every large-scale chemical plant there is usually the possibility of hidden leaks or careless manipulation of materials, and even of "camouflaged" accidents, causing quite a serious loss of material which will ultimately affect the yield of the process. In many cases a mere glance at a sample of the drainage from the plant would tell its own story, while systematic samples, taken by day and by night, would often tell their story of the things that happen while some men are asleep. In other cases, a simple chemical test might disclose in the drainage an abnormal amount of some material used or produced in the process, which, by careful tracing to its source, might result in considerable saving.

My own experience of acid manufacture, on a large oleum plant, has impressed me with the high potential loss of acid represented by a comparatively low acidity of the drain effluent running to waste, hour after hour, every day. For instance, over a period of six weeks the average amount of real H_2SO_4 passing from this plant by the drain was 6.82 tons per week. Think of it! On a make of 340 tons per week, 2 per cent. went down the drain, while in one of the six weeks 13.2 tons, equal almost to 4 per cent. of the make, were lost in this way.

When a systematic drain test was first introduced on the plant, it was found that tests occasionally showed a strength of 2 to 3 per cent. acid in the drain effluent flowing from the plant at about 200 gallons per minute, while a daily average test of about 1,000 parts H_2SO_4 per 100,000—i.e., 1 per cent. acid—was a frequent occurrence.

The approximate estimation of the total acid loss on this plant is greatly assisted by the fact that the whole drainage of the plant area leaves by a main drain in which the effluent passes over a weir bridged by a graduated V-notch, so that the depth of flow being known, the volume of the effluent can be calculated. Actually, the volume of effluent in gallons per minute is worked out for each quarter-inch depth of flow, and when sampling the effluent the flow is simultaneously measured.

In the early days of the test, samples were taken hourly by day and bi-hourly at night; but when a considerable improvement occurred the samples were taken every two hours, by day and by night. All these, of course, were "snap" samples.

Later a Pohl lift was applied to the constant delivery of a sample of the effluent into a large bottle during each two hours, and the average depth of flow at the beginning and end of the two hours was taken as the average flow for that sample. An obvious improvement would be the installation of a continuous flow recorder, but this was rejected as a too expensive item.

The actual test is carried out by a trustworthy boy of fourteen, who takes his own samples in the day-time, and tests the evening and night samples taken by the plant foreman the first thing in the morning. For this purpose a dozen 6oz. stoppered bottles, each painted with the hours for sampling, are supplied, each bottle in a special compartment of a box with a convenient handle for carrying. The following approximate method of estimation is used:—

50cc. of the sample are placed in a clean, conical flask of 150-200cc. capacity, and about 50cc. of distilled water are added. The mixture is titrated with N/10 Na_2CO_3 solution using methyl orange as indicator. The number of cc. of

standard solution used, multiplied by ten, gives roughly the parts of H_2SO_4 per 100,000 present in the sample. It is convenient to return the value in this form, and as the test is mainly a comparative one this practical method of calculation is sufficient. For instance, where 50cc. of the drain sample are neutralised by 49.2cc. of N/10 Na_2CO_3 solution, the value is entered as 492 parts H_2SO_4 per 100,000.

A daily record is kept on the plan shown in the following diagram, which illustrates the value of the test in the detection of leaks and waste.

D. y. Date.	Time of Sampling.	Drain Test in Parts H_2SO_4 /100,000.				Action Taken or Cause of Leakage.
		Main Drain.	Dip.	Frying Tower Drain.	Absorber House Drain.	
	9-0 a.m.	101	9½"	18	0	Reported to No. 1 Foreman.
	10-0 a.m.	113	9"	21	0	Reported to No. 1 Foreman.
	11-0 a.m.	110	9½"	124	95	Spill in Absorber House.
The day.	12-0 midday	90	8½"	152	3	No. 11 Drying Tower Leak.
6th May.	2-0 p.m.	70	7½"	112	7	No. 11 Drying Tower Leak.
1919.	3-0 p.m.	210	6"	306	5	No. 9 Drying Tower Leak.
	4-0 p.m.	116	6½"	250	9	No. 2 Drying Tower Leak.
	5-0 p.m.	73	7"	12	10	Normal after-effect.

The above is a typical record of a bad day for leakages. It should be explained that the main drain is the direct drain of the Glover and wash towers, and at 9-0 and 10-0 a.m. on the above date the absorber house and drying tower drains being good, the Glover and wash tower drainage was open to suspicion.

Every twenty-four hours the titration values and depths of flow are averaged, and the result calculated to tons of 100 per cent. H_2SO_4 per day by the following formula, in which the specific gravity of the effluent is taken as that of water for ease in calculation:—

$$\left. \begin{array}{l} \text{Average daily drain} \\ \text{test in tons of 100} \end{array} \right\} = \frac{x}{1,000} \times \frac{y \times 10 \times 60 \times 24}{2.240 \times 100}$$

per cent. H_2SO_4

where x = average test on flow in parts H_2SO_4 /100,000;
where y = volume of flow, in gallons per minute, corresponding to the daily average dip.

This drain test figure is entered and filed along with other results, on the summary of daily tests record.

But on the plant the matter does not end there. In the first place, a minimum drain test figure is fixed, actually 60 parts H_2SO_4 per 100,000, and whenever, by day, the drain test exceeds this figure, the tester has to report the fact to the plant foreman, who must either state the cause or discover it.

If the drain test is very high and no leakage can be found, spot tests are done on subsidiary drains, feeding the main drain until the guilty section of the plant is located, when a thorough search usually exposes the cause. As regards the evening and night tests, the shift foremen are asked to account to the best of their ability for high drain tests at definite times on their shifts, and in necessary cases are censured if carelessness has been shown.

The general result of the institution of these tests has been an increased keenness on everybody's part to cut down waste, quickly stop and repair leakages, and keep a more vigilant eye for the unexpected than was previously the custom. And the controllers of the plant have the satisfaction of knowing that the gap between the theoretical and practical efficiencies of the plant has been reduced, perhaps not by a large amount, but certainly by a significant one.

It would be impossible here even to indicate the method by which this test could profitably be employed on all varieties of large-scale chemical plant, but if the consideration of this subject causes just a little more interest to be shown in drain effluents it will be a sign of progress. Frequently no chemical test may be required, and simple observation of the

appearance and odour of the sample may be sufficient to show the absence or presence of valuable products.

Only the other week it was stated at the Thames Police Court that from the bond and storage warehouses of the Port of London alone, thousands of gallons of wine, etc., ran to waste yearly through leakages and spills. And this is no doubt true, to a certain extent, of all liquid storage areas, of whatever magnitude, from the stack of acid carboys in the yard of the small works to the bond warehouses of the largest port.

Now there is no doubt that much of this leakage could be stopped by prompt repairs or replacements, or by special draining arrangements in the case of valuable liquids, and it is on these lines that progress is desirable.

Years ago Great Britain annually ran to waste by-products of enormous value. To-day we watch our by-products (or should do) with the eye of an eagle. To-morrow let us watch our drain effluents that even the fragments may be recovered and nothing lost.

ESTIMATION OF ZINC AS SULPHIDE.

THE precipitation of zinc from solutions of formic acid by means of hydrogen sulphide has been studied by H. A. Fales and G. M. Ware (*J. Amer. Chem. Soc.*) with special reference to the conditions affecting the accuracy of the estimation. It is shown that the range of hydrogen ion concentration of between 10^{-2} and 10^{-3} is the most favourable for quantitative precipitation of zinc sulphide in a form suitable for rapid filtration and washing. The concentration of hydrogen ions may be kept within this range by the use of ammonium citrate solution and a mixture of ammonium sulphate, ammonium formate, and formic acid. A high concentration of an ammonium salt of a strong acid also favours the formation of a granular precipitate, as does a volume of at least 100c.c. for every 0.1grm. zinc present and a temperature of 95° to 100° C. The passing of hydrogen sulphide under pressure is desirable for rapid saturation and for avoidance of loss of formic acid by evaporation.

The zinc solution, freed from interfering elements, such as copper and cadmium, is evaporated to about 125c.c., and ammonia added until a slight permanent precipitate results. Twenty-five c.c. of citric acid solution (200grms. per litre) are next added, and the mixture made neutral to methyl orange by addition of moderately strong (15 molar) ammonia. Twenty-five c.c. of a mixture, containing 30c.c. ammonia (15 molar), 200c.c. formic acid (23.6 molar), and 250grms. ammonium sulphate per litre, are next added, and the volume is made up to 200c.c. or more if more than 0.2grm. zinc is present. The solution is heated to 60° C., and the flask connected with a hydrogen sulphide generator, so that the air is slowly displaced by hydrogen sulphide as the heating continues. At 90° to 100° C., when steam issues from the flask, the exit is closed, and the solution, as it cools, is saturated with hydrogen sulphide under increasing pressure. A Kipp generator provided with a pressure bulb is used for the supply of hydrogen sulphide. The generator is connected in series with a wash bottle which contains a manometer bulb, with a stem of such length that when the liquid level reaches the bottom of this bulb the pressure in the precipitation flask is approximately a third of an atmosphere. The flask is shaken frequently to ensure saturation, which is usually complete, when the precipitate settles rapidly, in about thirty minutes. The precipitate is filtered and washed with a cold, aqueous solution about 0.1 molar with formic acid (4cc. of 23.6 molar formic acid per litre) saturated with hydrogen sulphide. The precipitate is transferred to a porcelain crucible and the paper charred, preferably by standing the crucible on a quartz plate heated strongly by a Meker burner. The ignition of the filter-paper is very slowly and carefully completed in an oxidising atmosphere over a Bunsen burner. The reaction should proceed only to the formation of sulphate, not of oxide. After cooling, the precipitate is carefully moistened with concentrated sulphuric acid, and the crucible heated in an air-bath until the excess of acid is driven off. If zinc sulphide adheres firmly to the flask, as often happens, it must be dissolved in hot dilute sulphuric acid, the solution neutralised with ammonia, then made faintly acid with formic acid, saturated with hydrogen sulphide under pressure, heated to boiling to coagulate the precipitate, and filtered through the filter containing the already washed zinc sulphide. Further washing is unnecessary.

The method as described serves for the precipitation of zinc where only small amounts of the usual interfering metals are

present. Not more than 0.2mgrm. of manganese is carried down even when manganese is present in amount equal to that of zinc. Iron and nickel, however, require more acid to hold them up, if present in concentrations equal to one-tenth that of the zinc; in such cases 20c.c. excess formic acid (23.6 molar) must be present to secure a clean separation. Cobalt cannot be separated from zinc by one precipitation.—*The Analyst.*

CONJOINT BOARD OF SCIENTIFIC SOCIETIES.

THE second annual report of the Conjoint Board of Scientific Societies for the year 1918 has now been issued. The total number of constituent societies is now 54, and includes the following: The Royal Society, the Royal Society of Arts, the Institute of Chemistry, the Society of Chemical Industry, the British Association, the Chemical Society, the Institution of Petroleum Technologists, the Faraday Society, the Institution of Mining and Metallurgy, the Royal Microscopical Society, the Institute of Metals, the Biochemical Society, the Society of Public Analysts, and the Institute of Brewing.

Scientific Literature.

The enlarged committee mentioned in the first annual report was requested by the Conjoint Board to consider the question of the inclusion of applied science in any catalogue of scientific literature which might be recommended. Certain of the technical societies were requested to nominate members, and eventually the committee was constituted as follows: Mr. E. B. Knobel (convener), Dr. F. A. Bather, Professor W. M. Bayliss, Professor F. J. Cheshire, Professor A. Fowler, Mr. E. Heron-Allen, Dr. A. Holt, Dr. B. Daydon Jackson, Professor C. H. Lees, Professor A. E. H. Lowe, Lieut.-Colonel H. G. Lyons, Dr. P. Chalmers Mitchell, Dr. Norman Moore, Mr. W. M. Mordey, Professor J. C. Philip, Mr. F. Hamlyn Price, Professor A. Schuster, Professor C. G. Seligman (resigned July, 1918), Dr. L. J. Spencer, Dr. C. T. Hagberg Wright, Professor W. W. Watts (secretary).

Since the issue of the last report five meetings have been held. The constituent societies were circularised on certain points, and an interim report was drawn up for submission to the Executive Committee at its June meeting, with the request that the resolutions might be conveyed to the Royal Society, which, it was understood, was considering the subject in relation to the Inter-Allied Conference on Scientific Organisations about to be held in Paris. The Executive Committee acted accordingly without expressing an opinion on the report, which, for the present, they regard as final.

Glue and Other Adhesives.

At the instance of Colonel O'Gorman, the question of the supply of glue and other adhesives for aircraft manufacture was brought before the Executive Committee, and a committee was established to deal with the matter. Certain names were subsequently added, and the committee is constituted as follows: Lieut.-Colonel M. O'Gorman (convener), Professor W. W. Watts (secretary), Sir Dugald Clerk, Professor W. E. Dalby, Professor J. B. Farmer, Professor P. Groom, Mr. J. S. Highfield, Sir Herbert Jackson, Captain G. W. C. Kaye, Dr. J. C. Kernot, Professor W. H. Lang, Major A. Robertson, Mr. C. J. Wilson, Captain G. J. Woods. A deputation from the committee waited on Sir William Weir of the Air Ministry, and made a statement to the effect that the supply of raw materials was likely to be precarious, and that scientific research into adhesives would result in improving the product and standardising the methods of testing and manufacture. The Air Group of the Ministry of Munitions made a grant of £1,000. for the work, and empowered the committee to undertake this research on behalf of the Government. The work was placed in the hands of Professor S. B. Schryver at the Biochemical Laboratory of the Imperial College of Science and Technology. A staff was got together, and work began in August, 1918. Several important results have already been obtained, including improved methods of preparing casein adhesive; new glues either of remarkable properties, or made from materials of which there was no shortage, have been made, and the properties of adhesives are being standardised, so that waste of raw material and uncertainty in product will probably be minimised. The committee has completed its first report, which is being communicated to the Air Group, Ministry of Munitions.

SPONTANEOUS COMBUSTION OF CHEMICAL PRODUCTS.*

By Watson Smith, F.C.S., F.I.C.

SO-CALLED "spontaneous combustion" arises by reason of such chemical and physical changes in bodies mostly consisting of or containing carbon (carbonaceous substances), and under the influence of atmospheric oxygen, that sufficient heat is generated to give rise ultimately to combustion.

In order that the heat developed shall accumulate, and not be carried off by the surrounding air or other media, the matter inclined to "spontaneous combustion" must, as a rule, be a bad conductor of heat. Molecular changes by disturbance of the equilibrium of the smallest integral particles, mechanically fine subdivision of particles, moisture, and external heat, play the most prominent part, in the case of easily oxidisable substances, in the generation of this so-called "spontaneous combustion." With rising temperature, naturally, increased oxidation rises *pari passu*, and increases until the combustion point is reached.

Charcoal.

Aubert found that finely-ground charcoal placed in a barrel attained a temperature of 75° C. after fifteen hours; after twenty hours, ignition took place. The charcoal was found to have absorbed oxygen and a certain quantity of water. Having once had the management of a wood-distillery, I can testify to the need of great precautions to avoid the danger of outbreaks of fire in the charcoal sheds. Water is always used to quench the hot charcoal after raking it out from the ovens and shovelling it into the underground vaults, just before letting down the lids upon these vaults; and I can easily conceive that the addition of a certain excess of water might cause eventually a tendency to rise of temperature in the charcoal, albeit perfectly cold when raised from the vaults and wheeled to the sheds where it is stocked. In the two or three years I had charge here, there were two outbreaks of fire, promptly quenched, the stocks not being large in each shed. From all I could gather, it appeared almost like caprice that the charcoal in most cases kept cold, and yet on the single occasions referred to would heat up even to redness. Doubtless a slight counterbalance of moisture was the apparently capricious cause.

Aniline Dyestuffs, Lakes, etc.

In 1888, Hirsch observed that when the acid for nitration of benzene was passed through the S-tube, through which by mistake toluene had been allowed to run, the acid instantly became hot, and white vapours arose. A workman in this case tore out the tube, and as soon as he had thrown it away combustion broke out. Similar combustion may also arise if the agitator does not work when the acid for nitration runs into the apparatus. This unagitated acid falls to the bottom of the vessel, and when later on the agitator begins to work again, the violent chemical action ensuing raises sufficient heat possibly to lead to combustion, and if several vessels are connected together the effect may become one of explosion (*Journ. Soc. Chem. Ind.* 1888, 563).

Arlsberg, of New York, relates cases with the beautiful lakes of lead and eosine (tetrabromofluoresceine). These lakes have been very extensively used, and especially the mixtures with red lead (Pb_3O_4). Owing to their comparatively low price, they had supplanted in 1895 the mercuric sulphide and vermilion, and hence are known as "vermilion substitutes." On three different occasions, Arlsberg says, such mixtures of red lead and eosine took fire during transference from one cask to another. In vain did he seek for an explanation, although once he suspected a burning cigar or match to have caused the fire, but he could prove nothing, all the less as it was impossible to save any of the contents of either barrel owing to the extreme rapidity of the combustion.

When the second case of combustion occurred, Arlsberg failed to trace the cause to the use of either cigars or gas-pipe (used for stirring), but discovered that a burning gas-jet about five feet away from the barrel was guilty. The lake in question is very liable to raise a dust, whenever exposed to a very slight draught, which dust readily fired at the gas-jet. The Pb_3O_4 acted as a carrier of oxygen, and the combustion, once started at the gas-jet, set the whole case on fire with lightning rapidity. Since illumination by electric light had been established no further trouble arose.

The rapidity of combustion with such lakes (in the above case 95 per cent. of Pb_3O_4 with 5 per cent. of lake) is equalled,

* *Journal of the Royal Society of Arts.*

if not surpassed, says Arlsberg, by that of the ferro-ferricyanides which frequently take fire when being powdered. In such cases a spark, generally produced by a bit of iron (a nail), is the cause of ignition, the atmosphere furnishing the oxygen.

Endemann and Stebbins reported cases of combustion of copper and iron-lakes of logwood, for which they could not account (*Journ. Soc. Chem. Ind.* 1895, 947).

Zinc Dust.

L. Häpke records a serious case of zinc-dust firing, fully reported in the *Pharm. Centralhalle* of May 24, 1877, which occurred at Liverpool. In outline it was as follows:—

On December 11, 1876, twenty casks of so-called "zinc-dust" were shipped on board the *Lord Clyde* steamer. They were declared to contain "Dyestuff," and bore a ticket marked "To be kept dry, as, if damp, liable to get hot." Nothing was stated as a warning against liability to outbreak of fire or incandescence, etc. The casks were taken on board and lay there all night. Next morning a "smell of fire" was noticed, showing that something was burning on the ship. When the fire was extinguished, it was proved that it had arisen in the immediate vicinity of each cask of zinc-dust, and had injured or destroyed various goods stowed away upon or near these casks.

Later on it was discovered that most of the casks, before shipment, had lain upon the quay, and one of them was decidedly damaged. A portion of the contents had fallen out, and had got damped by rain. In this case the damaged cask had been filled up, the cask repaired, and then shipped with the rest.

Subsequently, the source of the fire was closely examined, and it was discovered, through the evidence, that the contents of this one cask were red-hot. The Court decided, after full inquiry, to confiscate the cargo and subject the would-be exporters to summary punishment. Ordinary commercial zinc-dust is a grey and very fine powder, consisting of 40 per cent. Zn, 2½ per cent. Pb, 4 per cent. Cd, 50 per cent. ZnO, and 3½ per cent. $ZnCO_3$. Because of its very fine state of subdivision, the metallic portion becomes oxidised very rapidly in presence of moisture, robbing the latter of its oxygen and liberating considerable quantities of hydrogen. Such zinc-dust is in great request in dyestuff works.

Chemicals.

Amongst the acids the most dangerous are sulphuric acid and nitric acid. As ships' freights, the carboys in hampers and straw should be stored with great care, and enclosed either under deck or on deck with sand, so that, anyhow, when the safety of the ship demands it, they can be readily pitched overboard. The schooner *Thetis* of Barth, was laden in Hamburg with sulphuric acid, and, along with various solid goods, also a quantity of nitre! The acid proved to consist of a dangerous mixture of 75 per cent. of sulphuric with 25 per cent. of nitric acid. With this pernicious cargo the captain put to sea on December 1, 1888, at Cuxhaven. When, on December 13, smoke was observed in the ship's hold, the captain pulled up near Plymouth where the fire was got under by steam-jets. Shortly after, the crew abandoned the vessel, and then four or five violent explosions occurred, which reduced the burning schooner to matchwood. Similarly the steamer *Oscar*, bound from Hamburg to Spain, had on board some carboys of vitriol, one of which leaked. A fire arose, and nothing would extinguish it but the wholesale inrush of sea-water, which means the ship had to be sunk!

E. Allairs (*Comptes rend.* 1919, clxviii. 729) has studied the conditions under which the air and ether vapour mixtures may ignite, and he used a special apparatus by which the proportions of the two gases could be varied as desired, and properly measured. The gaseous mixture was led into a U-tube, one limb of which was furnished with points like a Vigreux tube, and having an opening through which a thermometer could be introduced into the bend. The whole tube was then immersed in an oil-bath. Various catalysts, such as oxides of iron, copper, nickel, etc., were tried, but they were apparently ineffective, though the mixture of itself ignited "spontaneously" at about 190° C., when the amount of ether present was about 1 grm. per litre. The flame was pale blue, and visible only in the dark, and the products obtained were ethyl and methyl aldehydes and carbonic and acetic acids. No reaction took place before the ignition. This phenomenon explains the occurrence of accidents in factories and workshops in which ether vapour may diffuse accidentally. The author suggests the possibility, by modifying the conditions of the experiment and the use of tubes of greater diameter, of causing ignition at lower temperatures than the above.

NATIONAL UNION OF SCIENTIFIC WORKERS.

FORMATION OF BIRMINGHAM BRANCH.

ON Monday evening a meeting was held at the Chamber of Commerce, Birmingham, to consider the question of establishing a local branch of the National Union of Scientific Workers. There was a representative attendance of industrial chemists, chemical engineers, and members of laboratory staffs at the University of Birmingham and other educational institutions.

The chair was taken by Sir William Ashlev, vice-principal of the University of Birmingham, and Dean of the Faculty of Commerce. He pointed out that under modern conditions we were continually seeing the emergence of new classes and professions. This phase had been particularly marked in comparatively recent years. When one spoke of scientific workers, one thought, without strictly defining that body, of laboratory workers—people who engaged in scientific work in laboratories. Twenty years ago this was a small class in England even if one included all the staffs of the Universities and other scientific departments. There were then few men employed as industrial chemists in the laboratories established by business firms. But in recent decades the number had largely increased, and it appeared to him quite clear that the number would grow rapidly in the near future. Our Universities were going to have, one hoped, very much larger scientific staffs; and chemical laboratories created in great and small businesses were going rapidly to multiply. But besides those two directions we had seen in recent years the appearance of a new class—laboratories established by public authorities in connection with industrial research, and those created by the Government, such as the National Physical Laboratory, and the Laboratory connected with the work of the National Health Commission. It was apparent that the Government and municipalities would create more of such institutions. Therefore he foresaw a development of this new category of scientific workers; and if one took a broad view one saw a strong tendency towards association and combination. Hitherto we had been accustomed to associate combination chiefly with the manual workers, but of course, some of the oldest professions had long had their organisations which served substantially the same purpose. It seemed most natural that this new body of scientific workers should form its own association. The body of scientific workers could never be a closed body in the sense that some of the industrial unions were because of the varied work that a scientific man or woman might do, but it seemed clear that an increasingly large proportion would continue for the whole of their career in one class of work. In these circumstances it was desirable that there should be an organisation, part of the objects of which should be to safeguard, reasonably, economic interests. They wanted, moreover, to strengthen and maintain professional standards, and to acquire experience and knowledge which should be at the disposal of entrants into the profession.

Mr. O. L. Brady, D.Sc. F.I.C. (President of the National Union of Scientific Workers), said the reason the union was formed was in order that science should occupy its proper place in our national life. The war had brought out the great neglect of science in pre-war days, and many war troubles, brought about by the lack of scientific preparation, might have been avoided. The only hope of maintaining our industrial and trading position among the nations of the world was by the intense application of scientific principles to industry. Those who had any experience of the attitude of the manufacturer to science realised that a great deal had to be done. Hostility was still shown by some manufacturers towards scientific people in general. As a matter of fact the general public did not know what the scientific worker was, and still looked upon him as some extraordinary individual who liked to play with test tubes and bits of wire in the laboratory; they did not realise the part the industrial chemist played in industry. It was therefore felt desirable to educate the public on the aims of the scientific worker and to get for science a position in the country which was comparable with its importance. The supreme aim of the union would be to advance the interests of science, pure and applied, as an essential element in the national life, by the promotion of scientific research, and to secure the public endowment of such. They felt further that scientific and technical departments in the public service and all posts involving scientific knowledge should be under the direct control of persons having adequate scientific attainments.

A resolution was approved on the motion of Mr. Garner deciding to establish a Birmingham branch of the union, and a provisional committee was appointed to organise the branch.

SOUTH AFRICAN SOAP INDUSTRY.

THE development of the South African soap industry is reflected in the returns of the recent industrial census when taken in conjunction with the imports and exports for the last few years. Of a total consumption of approximately 26,000 short tons per annum no less than 24,750 tons were produced in the Union during the year 1916-17, representing a value of about £860,000. Unfortunately the information contained in the census forms with regard to production is not sufficiently detailed to admit of tabulation under the sub-heads laundry and household soaps, soft soap, toilet soap, extracts, and powders; but, judging from the fact that there has been a steady and substantial decrease in the imports of common and household soaps (1,500 tons in 1916, as against 3,300 tons in 1913), there is every prospect of the demand being entirely met by the South African product before long. The imports of both toilet soaps and powders rose steadily until 1916, but the drop in imports in 1917 seems to indicate that the local products are establishing themselves. There are 11 factories in the Union.

Except for salt and whale oil, the South African soap industry is almost entirely dependent on imported raw materials. In consequence of the advance in prices and of transport difficulties due to the war, the industry has been severely handicapped, but these difficulties have focussed attention on the possibility of profitably producing locally at least some of the raw materials. The imports of tallow into the Union for the years 1915 and 1916 amounted to over 4,000 tons; according to reliable estimates, not more than a third of that quantity is produced locally; only a small proportion of this is available for the soap industry.

Salt is very cheap, and the price of coal is such as to make it possible to produce electric power at a comparatively low figure. These are two essential items in the electrolytic manufacture of caustic soda, and, as far as can be judged from available data, the commercial production of caustic soda is possible, particularly if, as is probably in the future, there is a greatly increased demand for conversion into sodium cyanide and sodium arsenite. Carbonate of soda, as soda-ash, is imported to the extent of approximately 2,000 tons a year. The soda pan at Zoutpan, in the Transvaal, produces about 5,000 tons annually, partly as crude carbonate averaging 65 to 75 per cent. and partly as refined crystals. So far as can be ascertained, no appreciable quantities of carbonate have hitherto been drawn from this source for the local manufacture of soap.

The principal by-product of the soap industry is glycerine, of which approximately 850 tons (80 per cent. crude), are annually produced in the Union. The whole production of crude glycerine is, by arrangement with the Union Government, sold to the Cape Explosives Works, Ltd., which have the only refining establishment in the Union. The glycerine is sold at a fixed rate on the basis of 80 per cent. glycerol, with certain stipulations with regard to the percentage of ash.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

There seemed a reasonable chance a few days ago that it would be found practicable, so to increase hematite pig-iron production on the north-east coast as to compel a bigger output at the west Cumberland by-product coke ovens, but at the last moment the hope has failed to materialise. It is true that two additional blast furnaces have been relighted by the United Steel Company at the Solway Works at Maryport, but one of these is on special iron, of which the harder coke from the east coast is needed, and in any event the same company have damped down a furnace on spiegel and blown out another on ferro-manganese at Oldside, near Workington. Though the hunger for hematite iron is still unappeased, it continues to be impossible, on account of shortage of ore, to put more furnaces into operation, and it looks as if some months may elapse before the 380 by-product coke ovens in the district require to be as busily engaged as they were three months ago. The make of by-products is now of course considerably reduced, and some portion of the plant of the chemical works here is idle. And only benzole, for which there is a steady demand from Ireland; sulphate of ammonia, which is being taken by home users, and pitch, a fair tonnage of which is going to Spain, are readily disposed of.

OBITUARY.

Sir John Brunner.

We deeply regret to record the death of Sir John Tomlinson Brunner, Bart., which took place at his residence at Chertsey, Surrey, on Tuesday morning last, at the age of 77 years. By his death the British heavy chemical industry has lost one of its most successful pioneers, one who, by his indomitable courage and resourcefulness, was largely instrumental in placing the manufacture of heavy chemicals in this country on the solid foundation which during the last few decades has enabled it to be the predominant factor in the markets of the world. The history of the great firm of Brunner, Mond and Co., which Sir John, in partnership with the late Dr. Ludwig Mond, established nearly fifty years ago, is largely the history of the British chemical industry.

Born in Liverpool in 1842, the son of the Rev. John Brunner, who had left Zurich and settled in that city, where he established a private school, Sir John was educated entirely under the supervision of his father. At the age of fifteen he commenced his business career, entering the office of a firm of Liverpool merchants. There he remained for a few years,

Lafayette.

acquiring during that period the rudiments of a commercial training which, combined with the knowledge of chemical manufacture which he afterwards gained, in later years was to stand him in good stead. His next step brought him into close contact with the heavy chemical industry. He entered the service of Messrs. John Hutchinson and Co., alkali manufacturers, Widnes, with whom he stayed for eleven years. Then came the opportunity of his life, and he seized it. Ten years before, shortly after he had gone to Widnes, young Brunner made the acquaintance of the late Dr. Ludwig Mond, an acquaintance which quickly ripened into a close friendship. Dr. Mond had only just come to England to take up a post at the same works, where he worked out the practical application of a process he had devised for the recovery of sulphur from the black ash waste of the Leblanc soda process. The two young men, both in their early twenties, had agreed that if the opportunity arose they would enter into partnership as chemical manufacturers. In 1864 Dr. Mond returned to the Continent and embarked on the manufacture of alkali at Utrecht. Three years later he came back to England. A year or two afterwards considerable interest was aroused in the chemical world by the news that Ernest Solvay had succeeded in inventing a pro-

cess for the manufacture of ammonia-soda, the process being in operation on a commercial scale at Couillet, Belgium. Dr. Mond, in 1872, was enabled to inspect the original Solvay plant, and so impressed was he with the possibilities of the process that he returned to England determined to introduce it here. Very little time elapsed before the partnership which Sir John Brunner and Dr. Mond had so often discussed became an accomplished fact. That the venture turned out to be an eminently successful one is conclusively proved by the present position of the world-famous firm. With so ideal a combination of scientific knowledge and commercial ability, it would perhaps have been more surprising if the enterprise had met with anything but success.

In 1893 the partners were able to raise sufficient capital to purchase the Winnington Hall estate, near Northwich, situated on the Cheshire saltfield. Licences to manufacture by the process were granted by the inventor, and before the end of the year production of ammonia-soda had commenced. By the time the undertaking had been going for not much more than twelve months, the initial difficulties had been overcome, and, dating from the beginning of 1895, development was rapid, and went on unchecked. Improvements in the process were gradually introduced, and in 1896 Dr. Mond was able to claim that he had attained his object of rendering the ammonia-soda process an effective competitor with the Leblanc process in the production of bleaching powder. The steady development of the business of the firm, with a present nominal capital of fifteen millions, and ranking among the largest employers of labour in the country, has been due very largely indeed to the remarkable courage and skill of Sir John Brunner in commercial and financial affairs.

In his treatment of his workmen, Sir John showed a degree of consideration which was commensurate with his ability as an industrialist, and he devoted much attention not only to the improvement of their working conditions, but also to securing a betterment of their social conditions generally. In 1907 he inaugurated a profit-sharing scheme, by which the workmen were paid a bonus on their yearly earnings, varying in amount according to length of service. Sick benefit and other schemes to ameliorate the lot of the employees and their families were also inaugurated. Besides numerous philanthropic gifts to various towns and villages in Cheshire, Sir John endowed a Chair of Political Economy in University College, Liverpool, as a memorial to his father; and when the college became a university he made a contribution to its resources of £10,000.

In the world of politics he was, of course, a very prominent figure. As a Liberal member, he represented Northwich in the House of Commons continuously from 1885, with a break of a year, till January, 1910, when he resigned, being succeeded as Parliamentary representative by his eldest son, Mr. J. F. L. Brunner. He was made a baronet in 1895, and became a Privy Councillor in 1906.

Lord Rayleigh.

We regret to announce the death of Lord Rayleigh, the eminent physicist, in his seventy-seventh year. After receiving a private education, Lord Rayleigh entered Trinity College, Cambridge, taking his degree in the Mathematical Tripos with first place when only twenty years of age. In 1873 he was elected a Fellow of the Royal Society, and from 1879 to 1884 he was professor of experimental physics at Cambridge, in succession to Clerk Maxwell. In 1887 he succeeded Tyndall as professor of natural philosophy at the Royal Institution, resigning in 1905. He was secretary to the Royal Society from 1887 to 1896, and was elected president in 1908. He was awarded the Nobel Prize for Physics in 1904, and in the following year the Albert Medal of the Royal Society of Arts. In 1888, in the course of an investigation into the physical properties of gases, including their specific gravities, he found when dealing with nitrogen different results according to whether he procured it by removing all other known constituents from the air, or by the decomposition of nitrogen compounds, ammonia, for example, in the latter case the nitrogen being lighter. As a result of collaborating with the late Sir William Ramsay the discovery of argon was announced at the meeting in 1894 of the British Association at Oxford, further details being given in a paper read before the Royal Society in 1895. Other work of Lord Rayleigh included research in the fundamental electrical units, Boyle's law of low pressures, and optics and capillarity.

AMERICAN NOTES.

[FROM OUR OWN CORRESPONDENT.]

NEW YORK, June 16, 1919.

Protecting the Dye Industry.—The fight for the enactment by Congress of an import licence law to safeguard the dyestuffs and chemical industries of the United States against possible German invasion began to-day in Washington. The leading men of the industry are to testify before a Committee of the House of Representatives as to the need of putting into effect a law as speedily as possible that will insure the successful development of the American industry. Opinion is virtually unanimous among dye manufacturers that the licence system will solve the problem that now confronts the industry in respect to the possibility of German-made dyes being "dumped" into the American market. It is understood that one of the principal arguments that will be made before the Committee is that Germany has large stocks of dyes and chemicals which she is prepared to send to this country at the most opportune moment. This was pointed out a few days ago by Henry Wigglesworth, trade commissioner for the Department of Commerce, who went abroad to study the chemical and dye situation. At the annual meeting of the Manufacturing Chemists' Association in New York, Mr. Wigglesworth said: "Germany is still the dominating factor in the chemical industry to-day. During the war she had done her best to eliminate France and Belgium permanently from this business, and she has succeeded in setting them back to such an extent that it will take them years to recover, if ever they can. We cannot do better here than to adopt the method already working in England, which has been brought about by the foresight of the British Board of Trade—namely, that of the establishing of a Dyes Committee, which would be composed of representatives of the producer and the consumer, with a Government official at the head. The duties of this Commission would be to licence and admit to the country only such dyes as are not manufactured in this country. If we do not adopt some licensing system the wonderful progress that has been made in America during the war will be destroyed, and the accomplishments which we have achieved will be threatened. We must realise that \$25,000,000. worth of dyes must be used for every two and a half billion dollars worth of textiles, and so important an industry must not be destroyed."

Potash.—The potash interests of the United States are also demanding protection from German aggression. The Ways and Means Committee of the House of Representatives has already begun hearings to determine what should be done to protect the American potash industry. Testimony by representatives of the industry displayed the fact that they are indifferent as to whether this protection be given by an import duty or by some method of licensing imports, but the opinion frequently expressed is that unless some protective steps are taken this industry, fostered by the Government during the war, will be wiped out of existence. It was stated by one witness that \$50,000,000. has been invested in the American potash industry. American plants have assembled about 60,000 tons of potash, and plants here have been forced to shut down in a number of cases. It was declared that there is absolutely no demand in the United States at the present time sufficient to take the domestic output, let alone any imported potash. At one of the hearings American potash producers were accused by Representative Rainey, of Illinois, of unlawful combination in violation of the anti-trust laws. Mr. Rainey stated that the potash producers are practically a unit in asking \$250. a ton for their product. "You do not come here with clean hands," said Representative Rainey to one manufacturer. "You have a combination, and are violating the anti-trust laws." Other members of the committee took exception to that statement, and said there was no basis for it.

SOCIETY OF GLASS TECHNOLOGY.

THE last meeting of the Society of Glass Technology was held at the University, Sheffield, the president, Mr. S. N. Jenkinson, in the chair.

Mr. Jenkinson read a paper on "Impressions of a Recent Tour of the German Glass Factories." During his tour in Germany the author visited Silesia, Saxony, Saxe-Weimar, and other districts, and investigated conditions in several works, particularly glass factories. The size of the glass industry in Germany in pre-war days can be judged from the fact that in 1913 they exported glass to the value of 123,000,000 marks, and pottery to the value of 94,000,000

marks. This amount means that 75 per cent. of their output was exported. It can be realised, therefore, that the outbreak of war caused the shutting down of many German glass factories during 1914-15. The policy during 1915-16 in Germany was to reopen several of the factories, and allow one furnace in each works to be kept going, and a scheme was inaugurated whereby finance in the industry was pooled. At the present time very little production of glassware is taking place, due largely to the lack of coal and the state of transport. Their stocks are very low. Throughout the visit he was very much impressed by the fact that all the plant in the works was kept in the highest pitch of efficiency, so that immediately opportunity came a high rate of production would follow. This fact will have to be taken into account by British manufacturers. Out of some 132 furnaces which he made inquiries about, only eight were working.

Dr. Turner read a paper on "The Properties of British Fireclays Suitable for Glass Works Use. Part I. The Variation of Shrinkage, Density, and Porosity with Temperature," by Edith M. Firth, B.Sc., F. W. Holden, B.Sc., and W. E. S. Turner, D.Sc. This paper was well illustrated by assemblies of fireclay blocks showing the behaviour of various fireclays under the tests outlined by the authors. The paper is the first communication of a research carried out under the auspices of the Refractories Research Committee of the Society.

NEWS FROM THE ANTIPODES.

[FROM OUR OWN CORRESPONDENT.]

SYDNEY, May 15.

Future of Phosphate Island.—According to a passenger on the steamer *Pukaki*, which has arrived in Sydney from Ocean Island and Nauru, the inhabitants of Nauru, the ex-German phosphate island, regard as wild and impossible the recent report that Australia and New Zealand are to be given the joint management of the island. It was pointed out that there are at present three different administrations in the island. Civil control is exercised in Fiji; an Australian military force is acting as garrison, and the Navy Department has control of the wireless station, which has been in daily use during the past three years. Many inquiries are being made regarding land titles, but no definite information is available, as everything depends upon the final decision of the Peace Conference regarding the future of the island and its rich phosphate deposits. A few months ago the natives in Nauru held a meeting, and carried a resolution expressing their desire to remain under British rule. The *Pukaki* brought 1,500 tons of phosphates.

The N.S.W. Tin Industry.—The value of tin ore produced from the tin fields of New South Wales to the end of 1918 is £11,511,880. The value of the output for the year 1918 was £548,876., as compared with £373,696. in the preceding year, thus showing an increase of £175,180. The chief contributing factors to this very satisfactory result was the high price ruling during the year and the output furnished by the dredges.

Increase in Silver-Lead Production.—An increase in quantities and value of the production of silver-lead and zinc was noted in New South Wales during 1918. The output of the silver-lead mines during 1918 was valued at £5,712,138., which was an increase of £602,042. on that for the year 1917.

Chemical Market.—A more optimistic tone is making itself felt in the market for commercial chemicals. Cheaper parcels seem to be disappearing. Many have been worked off the market, while in other instances holders have taken more heart, and are steadily refusing to make sacrifices. Spot prices are once again tending towards overseas equivalents, although many lines yet remain below current c.i.f.e. values. The position for citric acid has been strengthened by the action of some local firms in making re-exports to London. The c.i.f.e. price of citric acid in London has been in the vicinity of 4s. 7d. per lb. for some time. Parcel lots here have been offered at down to 3s., thus giving a very fair margin for shipment back to England. It is said that when merchants came actually to look round for "cheap" citric acid, the quantity available was surprisingly limited. The latest spot quotation was about 3s. 6d. for parcels, with distributing lots at up to 4s. 3d. In cream of tartar there was likewise a better feeling. American and Italian were worth 2s. 3d. net, and French 2s. 6d. net, the distributing rates ranging up to 3s. The last overseas quotation for French cream of tartar was 2s. 8d. c.i.f.e.—equivalent to about 3s. landed. Tartaric acid was worth 3s. 6d. to 4s. on spot, the c.i.f.e. price standing at 3s. 7d.

LEGAL INTELLIGENCE.

Prussiate of Soda Contract: Question of the Prohibition of Export.

A claim for damages for alleged breach of a contract for the sale of yellow prussiate of soda, came before Mr. Justice Bailhache in the Commercial Court of the King's Bench Division on Friday (June 27). The plaintiffs were Messrs. A. Klipstein and Company, of New York, and the action was brought against The Manchester Oxide Company Ltd., of Canal Street, Miles Platting, Manchester.

Plaintiffs' case was that by a contract dated July 10, 1914, the defendants contracted to sell and deliver to them 600 tons of yellow prussiate of soda at 23d. per lb. Delivery was to be in equal monthly quantities over 1915 and in casks free, f.o.b. Liverpool. By Clause 1. of the conditions of sale, it was provided that "deliveries may be suspended pending any contingencies over which the vendor has no control (such as strike, lock-out, fire, accidents, war or the like), causing a short supply of fuel or raw material, or otherwise preventing the manufacture of the article." By Clause 2 it was provided that any deliveries so suspended might be claimed by the buyer at the same rate of delivery, commencing after the period assigned to his contract if such claim were made within a month after such suspension. The plaintiffs, as the defendants well knew, required the goods for the purpose of resale. Defendants it was alleged had not delivered the 600 tons of yellow prussiate of soda, and the plaintiffs claimed damages.

The defence was that an order issued in February, 1915, prohibited the export of yellow prussiate of soda other than to British possessions.

Mr. Compston, K.C., opened the case for the plaintiffs, and said it was admitted that not one ounce of this prussiate of soda was delivered by the defendants.

Evidence was given by Mr. Klipstein, junr., son of the chairman of the plaintiff company, who said they had customers in Canada to whom they could dispose of the goods.

In cross-examination by Mr. Leslie Scott, K.C., witness said he had not got with him the list of their customers in Canada and he could not give the list from memory.

Mr. Leslie Scott said the case for the defendants was that as regards all shipments due under the contract from and including the month of February the defendants were prevented from export by the prohibition.

Mr. Robert Henry Clayton, a director of the defendant company, said there was no consumption of prussiate of soda in Canada.

Asked why the defendants did not perform the contract, witness replied, "Because of the prohibition."

Mr. Compston: There was no prohibition to Canada?

Witness: We did not think Canada came within our contract.

Mr. Percy Ashley, assistant secretary at the Board of Trade, gave evidence that in January, 1915, their attention was called to the manufacture of cyanide and its relation to the gold supply of the British Empire, and after consultation with technical advisers concerned with the chemical industry, they came to the conclusion that there was a *prima facie* case for an order in regard to the restriction of the exportation of prussiate of soda.

Mr. William Neill, of Glasgow, said he was the managing director of the Cassel Cyanide Company, Ltd., of Glasgow, who were the largest manufacturers of cyanide of sodium in the world. The Cassel Company's cyanide was produced by a synthetic process, and not through prussiate of soda. During the early part of the war they were consulted by the Government on various matters connected with cyanide. Cyanide was mainly used for the recovery of gold and silver from ores. Prior to the outbreak of war, the South African firms were drawing about 60 per cent. of their cyanide requirements from Germany. The order prohibiting the export of prussiate of soda other than to British possessions was necessary and could not, in his opinion have been relaxed, right up to the armistice. There was no consumption of prussiate of soda in Canada.

Mr. Kenneth Chance, managing director of the British Cyanides Company, Ltd., also gave evidence on behalf of the defendants.

On Monday, when the hearing of the case was resumed, counsel addressed his Lordship, and Mr. Compston, K.C., for the plaintiffs, said the actual proclamation was issued on March 2, so there was no prohibition until that day.

His Lordship pointed out that in February orders had been given to the Customs in anticipation of the proclamation.

Mr. Compston said there would have been no illegality in shipping the prussiate of soda to Canada. His clients were

entitled to have it shipped to Canada, and they called for it to be shipped there.

His Lordship said he was satisfied there was no substantial consumption of prussiate of soda in Canada.

Mr. Compston admitted the Canadian demand was not the same as the American demand, but said he had evidence of 20 tons being taken to Canada in two months, and that was 120 tons in a year. The plaintiffs had customers in Canada. Defendants must make out that by performing the contract they would be committing an illegality, and he submitted they did not do it.

Mr. Leslie Scott, K.C., on behalf of the defendants, replied to the point in reference to Canada that the plaintiffs did not really want the prussiate of soda in Canada, and never gave the defendants any intimation, pursuant to the terms of the contract, upon which they, as sellers, were called to act.

His Lordship, in giving judgment, went fully into the facts of the case and said it seemed to him he must act upon the proclamation of the Board of Trade, which prevented all exports of prussiate of soda from this country to America after about the middle of February. From February onwards there was a complete defence afforded by the proclamation of the Board of Trade so far as the United States was concerned. He was satisfied from the evidence given to him that there was in fact no consumption in Canada of prussiate of soda,—that was to say, none worth mentioning, and he had come to the conclusion, upon the whole of the correspondence, that the request to ship to Montreal was not a business request which it was intended that the defendants should act upon. Upon the whole of the circumstances, the defence succeeded, except as to failure to ship the January quantity. As to that there must be damages.

Judgment was then given for the plaintiffs for £1,750.

German Patents for Dope and Varnish.

In the Patents Court on Thursday (June 26), Messrs. Nicholson's (Newcastle-on-Tyne), Ltd., of Heaton Junction, Newcastle, applied for licence to manufacture varnish, etc., under half a dozen of the German Baekeland patents.

Mr. Potts, for the patent agents, Messrs. W. P. Thompson, and Co., Liverpool, explained that the applicants had been making the standard dope for aeroplanes during the war, and had installed a big plant which was well adapted for manufacture with underground reservoirs to contain the inflammable liquid, mixing tanks and complete arrangements for delivering the varnish. It was now proposed to develop the varnish industry. The patents, in the main, related to products obtained by mixing phenols and formaldehyde, which could be used for almost any purpose for which varnish or waterproof materials were used.

Sir George Croydon Marks, for the patentees, suggested that there was no evidence that the applicants were familiar with the processes covered by the patent, and recommended that the licences be not granted at the present stage. There was not sufficient evidence that the applicants would carry on a business for which these patents were essential.

Mr. Potts replied that the applicants had a large plant which they must use or else sacrifice the money expended. They had devoted several months to experimenting.

Sir George: British Dyes, Ltd., are concerned with working these patents and they are a very large concern.

Mr. Potts: There is scope for others in this big industry.

Sir Cornelius Dalton, who presided, said he thought more evidence should be produced. It was premature to grant a licence now, and he would grant an adjournment for more detailed particulars to be put in.

Yate Chemical Works, Ltd.

In the Chancery Division on June 27, Mr. Justice Astbury appointed a receiver and manager of the Yate Chemical Works, Ltd., on a motion in the action of Lord Leconfield and the company.

Counsel said that the plaintiff was the sole debenture holder to the extent of £27,000 and had taken action as the company had ceased or threatened to cease to carry on business.

RADIO-ACTIVE SUBSTANCES IN ITALY.—The Italian Minister of Agriculture has just appointed a commission which will conduct an exhaustive investigation with a view to determining whether or not radio-active substances exist in Italy in sufficient quantities to be of practical use. Important studies in this connection have already been made by Professor Millosevich and by Professor Rasini, of the University of Pisa, the results of which have given rise to hopes that success may be attained.

FRENCH CHEMICAL TARIFF.

IN accordance with a French Presidential Decree of June 14, in addition to the import duties leviable under the law of January 11, 1892, and subsequent laws, goods of foreign origin imported into France or Algeria are subject to *ad valorem* surtaxes. Goods which are proved to have been shipped to France prior to the date of publication of the Decree (June 18), will be admitted under the former tariff conditions. The chemical schedule is as follows:

No. in Customs Tariff.	Articles.	Rates of Duty under the Minimum Tariff.		No. in Customs Tariff.	Articles.	Rates of Duty under the Minimum Tariff.	
		Tariff Duty.	Surtax established by the present Decree.			Tariff Duty.	Surtax established by the present Decree.
		Francs. cts.	per cent. ad. val.			Francs. cts.	per cent. ad. val.

BRITISH ASSOCIATION OF CHEMISTS.

Hon. Registrar: Dr. FRANCIS W. KAY,
Chemical Department, The University,
Liverpool.

NOTICES.

NOTICES and reports from secretaries of local Sections and articles and correspondence for these pages should be sent to the hon. editor, Dr. E. H. Rodd, 7, Mauldeth Road West, Withington, Manchester, and not to the *Chemical Trade Journal and Chemical Engineer*.

The hon. editor will be glad to receive short articles on the views of members with respect to the B.A.C., its aims and aspirations, for publication in these pages. Such articles should be accompanied by the name and address of the writer, not necessarily for publication.

Reprints of the proceedings of the British Association of Chemists as published in the *Chemical Trade Journal and Chemical Engineer* can be obtained from the hon. editor on payment of an annual subscription of 4s.

THE PROCEEDINGS OF THE ASSOCIATION.

Liverpool Section.

Hon. Local Secretary: Dr. Francis W. Kay, Chemical Department, The University, Liverpool.

The local hon. secretary regrets that, owing to a printer's error, Mr. J. M. Taylor's name was omitted from the list of committee men published in the June 14 issue of the *Journal*.

A fully attended committee meeting was held on Thursday, June 19, when the following resolution was tabled, and it is suggested that it merits more than local consideration on account of its fundamental importance to any prospective members:—

"That there is urgent need for democratic reform in university and technical education; and that in view of the revised regulations of the Institute of Chemistry, by which a degree with first or second-class honours in chemistry will be accepted after training in day or evening classes as a qualification for admission to the associateship without examination, it is desirable that the B.A.C. take steps to ensure (a) that all universities and technical institutions be open in the evenings for the purpose of training students for the full degrees in all the faculties and for post-graduate research; (b) that the N.U.S.W., the N.A.I.C., the Society of Chemical Industry, and other scientific bodies, be asked to co-operate, and thus lend their support to a reform which would do much to relieve the educational loss consequent upon five years of war conditions; and (c) that failing the opening of the universities in the evenings, as many technical institutions as possible should be raised to university rank—on the lines of the Michigan College of Technology,—with power to confer degrees in technology after approved courses of study in day or evening classes."

Council Meeting.

The next meeting of the Council, at Derby, is to be held on Saturday, July 12, instead of June 28, as previously announced.

WHITLEY COUNCILS COMMITTEE.

In pursuance of the arrangement made at the recent conference of scientific and technical organisations, a meeting of the representatives of the chemical organisations present at that conference was held at the Midland Hotel, Manchester, on Saturday, June 21, to discuss practical steps of federation for the purposes of the Whitley scheme. The proceedings were private, but substantial progress was made, and a further meeting will be held on July 19.

INTERVIEW WITH A LABOUR REPRESENTATIVE.

The registrar, Dr. Kay, has had an interview with Mr. Thomas Williamson, who represents on the National Industrial Council for the Chemical Trade, the National Amalgamated Union of Labour, the Federation of Chemical Workers, and the Federation of General Workers. The following account of this interview throws some interesting light on the attitude of the worker towards the technical man, and is of importance in view of the efforts which are now being made by the B.A.C. to secure the representation of the chemist on Whitley Councils:—

(1) Chemists and the National Council.

Mr. Williamson stated in the course of the interview that the question of including chemists' representatives on the Council had been considered during the preliminary meetings which preceded the establishment of the National Council, but not to the advantage of the chemist. The chemist was also at a serious disadvantage in not having the backing of an organised association or an official representative. It was thus an easy matter to dispose of any claim he had to a seat on the Council.

(2) Chemists and Labour Generally.

The attitude of the labourer to the chemist was briefly touched upon, Mr. Williamson stating, in reply, that most of the men about a chemical works seldom came into contact with the chemist, and consequently could not have any but hostile feelings towards him, especially as the latter was inclined to stand aloof. The union official, on the other hand, fully realised the special position filled by the chemist in the works, and would be prepared to support him in any dispute. On the matter of wages, too, the union official appreciated the chemist's claim to something entirely different from the earnings of the ordinary skilled workman.

Commenting on the characteristic individuality of the chemist—the natural result of having to work alone more often than not,—Mr. Williamson explained it was largely on that account that we should find it difficult to make rapid progress. The very fact that most workmen worked together in gangs or squads developed the habit of acting together in their disputes with employers; this habit was really at the root of trade unionism. Environment had therefore an important bearing on the growth of the trade union spirit, and the chemist, having no environment except that of his test-tubes and books, lacked one of the driving powers of concerted action such as that of trade unionism.

(3) Future Possibilities for Chemists.

The allocation of seats on the National Council being entirely on the basis of the numerical strength of the unions engaged—i.e., the number of the various types of trade union workmen employed,—the chemist, owing to his numerical inferiority, stood no chance whatever of getting a seat for himself. The case mentioned by Mr. Todd, where a numerically inferior craft union was given totally disproportionate representation owing to the impossibility of its members gaining a livelihood elsewhere, was cited in favour of giving special consideration to the claims of the chemist, but Mr. Williamson was very emphatic in his reply that the strong unions would strenuously oppose any other kind of representation. To take an obvious case, the cotton operatives in a weaving-shed would object to the stokers carrying the same weight on the Council as themselves. It was brought sharply to notice that the labourers in a chemical works considered themselves just as indispensable as the chemist.

(4) Immediate Steps.

As an absolutely necessary preliminary, Mr. Williamson strongly advised incorporation as a trade union. The employed side of the Council would then be bound to take up the case of the chemist as soon as formal demands had been lodged in the proper quarters. He seemed decidedly confident that the employers would have to agree to whatever recommendation came from the trade unions. In order to find a place for chemists, the Council would have to be augmented equally on both sides. At present the Council was fully occupied with the settlement of economic problems, and would be for some time to come. Mr. Williamson scarcely held out any hope of the early consideration of the scientific and administrative functions being undertaken by the Council, as at present all their time was occupied in adjusting the various differences as between one group and another, and between the various districts. Finally, in reply to a query regarding the necessity or otherwise of affiliating with other trade unions, and introducing strike clauses, and of making provision against victimisation, Mr. Williamson stated that that would have to be considered by the trade unions on the employed panel, and declined to give any indication of what might transpire; he had nothing at all to guide him in this matter. He was strongly opposed to the B.A.C. approaching the Council until we were registered—e.g., it would weaken our case to go to the Council with the statement that incorporation as a trade union was pending, as the unions might possibly smell a rat, and anticipate a change of tactics once we got on the Council; apparently there is still a fair amount of mutual mistrust between the unions and professional men, into which latter category they

apparently place the chemist on account of his schooling and political inclinations.

A SWEATED INDUSTRY.

The following has been received from a correspondent:—

Among the advertisements appearing in a recent number of *Nature*, the two following are well worth comparison. The College of Medicine of the University of Durham wishes to secure the services of a *qualified medical man* (the italics are mine) to act as an assistant in the department of bacteriology; salary, £500. per annum. At the same time the University of Edinburgh advertises for demonstrators in chemistry at an initial salary of £200., rising to £250. per annum. As far as my experience goes, a person is not usually appointed to a university teaching post in chemistry unless he is an honours graduate with at least two years' research experience—that is, six years' study at least; whereas a medical qualification can be obtained in five years. I was also under the impression that a demonstrator is a step above an assistant. Why, then, is the assistant offered £500. and the demonstrator only £200.? Let us refer to the advertisements again, and see if there is not some practical reason for it. Oh, yes! The assistant must be a *qualified medical man*.

No institution dare offer a qualified medical man less than £500. a year, simply because the medical men stand together in a strong body, and would turn down, and rightly so, a smaller offer. It is quite time a stop was put to the common practice of offering these miserable salaries to scientific men—salaries equivalent to about £80. before the war, and scarcely affording the means of subsistence even to a single man of the most simple tastes. The universities are among the worst offenders. They may plead poverty, but they pay adequate salaries to those who can enforce them. Cheap education at the expense of the teachers means bad education. It is urgently necessary that steps be taken to put teaching staffs on a better footing.

The remedy lies in the hands of the chemists themselves. Less than two years ago the B.A.C. was launched with the avowed object of improving the status of the chemist, and, after being battered by tempest and rain, is now entrenched on solid ground behind a rampart of six to ten hundred diards, six hundred of whom are determined to win or die. What are you doing, Mr. Non-member, sitting on the fence? Waiting to see what others are going to do first? We can hold our ground with our present numbers, but we cannot advance without reinforcements. Come inside, and do your bit towards putting your house in order.

CORRESPONDENCE.

The Organisation of Chemists.

Writing from Tudor Lodge, Boughton, Cheshire, Mr. J. Fortesquien, in the course of an interesting letter, urges the necessity of close co-operation between the many societies devoted to chemistry, of which he enumerates nine, with a view to the furtherance of the interests and the raising of the status of the chemist. He deplores the fact that chemists have hitherto displayed nothing like the same energy and organising ability as the manual workers in impressing upon the industry the vital importance of their profession. If they had done so, chemists would now be in receipt of remuneration more in proportion to that received by members of other professions demanding equal training. He questions, indeed, whether the man who is incapable of bettering his own conditions is capable of furthering the interests of his employer! Since so many chemists belong to more than one society, it is obvious that with a scheme of federation, two organisations could well be created, one devoted to the improvement of the material and professional interests of the chemist, the other to purely scientific objects; and this at less cost to a profession at present so poorly paid. Chemists should urge upon the secretaries and councils of the various scientific societies the necessity for a constructive policy of federation. As to the benefits to be derived from an organisation of adequate numbers and revenue devoted to their professional interests, the chemist is recommended to study the daily press.

[Mr. Fortesquien seems to be unaware that such a federation of societies as he suggests is already in being. "The Federal Council for Pure and Applied Chemistry" has for its primary object the promotion of closer co-operation between the societies representing the various branches of chemistry, and consists of representatives appointed by the following eleven societies: The Chemical Society, Society

of Chemical Industry, Association of British Chemical Manufacturers, Institute of Chemistry, Society of Public Analysts, Faraday Society, Biochemical Society, Iron and Steel Institute, Institute of Brewing, Society of Dyers and Colourists, and the Society of Glass Technology. None of these societies, of course, has power to carry out the objects for which the B.A.C. was formed.—Ed.]

PARLIAMENTARY NEWS.

Sulphuric Acid Consumption.

In the House of Commons on Tuesday, Sir R. Cooper asked the President of the Board of Trade the quantity of sulphuric acid that was consumed in the United Kingdom in 1913 and 1918, distinguishing between ordinary commercial acid and fuming acid?

Sir A. Geddes: In 1918 the quantity of sulphuric acid consumed in the United Kingdom was, according to information placed at my disposal by the Ministry of Munitions, about 1,290,000 tons (100 per cent. acid), including about 310,000 tons of fuming acid. The corresponding quantity for 1913, so far as can be estimated, was 1,000,000 tons, the fuming acid included being about 25,000 tons. In both cases the figures refer to acid freshly manufactured in the year.

Committee's Report on British Cellulose Company.

Mr. Raper asked the Prime Minister if he will state when the report of Lord Sumner's Committee regarding the British Cellulose and Chemical Manufacturing Company will be forthcoming?

Mr. Bonar Law: It is hoped that the report will be ready before the end of the month.

Levinstein, Ltd.

Sir Auckland Geddes, on Wednesday, in reply to Mr. Macquisten, said: The Port Eilsworth works of Meister, Lucius and Bruning were sold under the Trading with the Enemy Legislation to Levinstein, Ltd., a British controlled company, of which Lord Armaghdale is chairman and Dr. Herbert Levinstein, a British-born subject, is managing director. The purchase price was approximately £79,000. No secret processes for the manufacture of dyestuffs were discovered there. The details of an agreement made between Levinstein, Ltd., and the Du Pont Company are known to the Board of Trade, but I do not feel able to make them public without the consent of the parties concerned. I will say, however, that they do not warrant the interpretation put upon the agreement by my hon. friend. Dr. Levinstein is only one of the managing directors of British Dyestuffs Corporation, which is acquiring British Dyes, Ltd., and His Majesty's Government are not increasing their investment in that corporation. In view of the suggestions in the question, I should add that Dr. Levinstein and the company with which he has hitherto been specially associated have rendered very great services both to His Majesty's Government and to British dye-users during the war.

OUR BOOK SHELF.

THE CLAIMS OF LABOUR AND OF CAPITAL. By W. R. Cooper. London: Constable and Co.; 2s. 6d.

Contains much in the way of truth and suggestions which should be helpful in enabling a better understanding between Labour and Capital. Although very thorough in its way, it is hardly likely that every reader will accept it *in toto*; nevertheless, taken broadly, ground, which is or ought to be common, is laid bare. Having done this, the author endeavours in a liberal spirit to serve the interests of both parties.

T.N.T.: TRINITROTOLUENES AND MONO- AND DINITROTOLUENES. By G. Carlton Smith, B.S. London: Constable and Co.; 8s. 6d. net.

Although arriving here from U.S.A. rather late in the day as far as T.N.T. is concerned, this work contains much that is useful and interesting. Its leading sections are the Theory of Nitration—Manufacture—Purification—Inspection and Testing and Properties of the Trinitrotoluenes. Subsequent parts are the Properties of Mono- and Dinitrotoluenes—Accidents and Diseases.

ITEMS OF INTEREST.

NOBEL PRIZES HELD OVER.—The Swedish Court has agreed that the distribution of the Nobel prizes for 1919 for physics, chemistry, medicine, and literature, as well as the prizes for some subjects held over from 1918, shall be postponed till June 1, 1920.—*Reuter*.

BRUNNER, MOND AND CO., LTD.—Messrs. Brunner, Mond and Co., Ltd., authorise the contradiction of the rumour referred to in the financial notes of some of Monday's papers that they contemplate the purchase of Messrs. Van den Berghs, Ltd., margarine and soap manufacturers, etc.

ZINC AND ZINC DUST PRICES.—Australian high-grade zinc dust, 88-92 per cent. metallic zinc purity, is unchanged in price at £70. per ton, f.o.r. Australian electrolytic zinc, containing 99.95 per cent. metallic zinc, remains at £40. per ton, f.o.b., Australia, for direct shipment to New Zealand, India, South Africa, and the Far East.

SULPHATE OF AMMONIA.—In our issue of June 21 it was erroneously stated that 40,000 tons of sulphate of ammonia had been put at the disposal of farmers for June-September delivery at £17. per ton. The Sulphate of Ammonia Association informs us that the quantity to be sold at £17. per ton, as agreed with the Board of Agriculture, was 5,000 tons, and this has been disposed of. The price for July-September delivery is now £19. 10s. per ton.

ARTIST COLOUR MANUFACTURERS.—The following gentlemen have been unanimously re-elected in connection with the British Artist Colour Manufacturers' Association: President, Mr. W. E. Killik (Winsor and Newton); hon. treasurer, Mr. W. G. Rowney (Rowney and Co.); committee, Mr. C. J. Wild (Reeves and Sons), Mr. C. P. Park (C. Robertson and Co.), Mr. E. F. Chapman (James Newman), and Mr. Vincent Nello (Madderton and Co.); hon. secretary, Mr. G. R. Cheesman, 6, Holborn Viaduct.

BRITISH SUGAR BEET FACTORY.—With the assistance of M. Rene Bouchon, of the Sugar Makers' Association, France, a site has been chosen for a factory which the British Sugar Beet Growers' Society proposes to build on its estate at Kelham. M. Bouchon was much impressed with the suitability of the Kelham estate in soil, climate, and transport facilities for the inception of this enterprise. It is believed that the Kelham enterprise will form the nucleus of a very large new agricultural industry, finding employment for many thousands of people and helping greatly to restore the prosperity of our country districts.

GERMAN PLATINUM.—*Nieuwe Rotterdamsche Courant* states that shortly before the war it was discovered that there were great quantities of platinum in the districts of Olpe and Siegan, in Westphalia and in the Westerwald. At the outbreak of the war the capital necessary for exploitation had not been raised. Capitalists have now been found, however, who are prepared to finance the exploitation of platinum in the above-mentioned districts. Should the exploitation prove successful a new industry will be established which, it is said, will be a compensation for the loss of the potash mines in Alsace.

MEXICAN DEMAND FOR CHEMICALS AND TINPLATES.—The British Consul-General at Mexico City reports that there should be a very considerable demand for sodium and potassium cyanide in the Zacatecas district as soon as conditions permit the mining companies to restart their reduction plants. At the present time there are two mills in operation. Between them, their cyanide consumption will be, roughly, 18 tons per month. The district consumption might be calculated at 40 tons monthly. In view of the expected enlargement of the oil industry in Mexico, there should be a considerable increase in the demand for tinplates from South Wales, although they will meet with heavy competition from other countries.

GLASGOW FAIR.—With the approach of the date for the next British Industries Fair, to be held at Glasgow, it is interesting to report that the important section for industrial chemicals is now already well filled, and stall space has already been booked by such well-known firms as the Solway Dyes, Ltd., Messrs. Levinstein, Ltd., British Dyes, Ltd., Brotherton and Co., Ltd., and the Explosives Company, Ltd. It has also been decided to send an invitation to the British Chemical Manufacturers' Association requesting that the claims of the Fair should be brought to the notice of the members of that organisation, and it is hoped that as a result the importance of the chemical section will be further augmented.

A COLLOIDAL SILICATE.—In the course of the work of the Department of Scientific and Industrial Research, attention has been called to a certain colloidal silicate, apparently not hitherto in use, which may possibly prove to be of commercial value, especially in the textile industry. A limited number of small samples of this substance may be obtained on application to the Department of Scientific and Industrial Research, 15, Great George Street, Westminster, S.W. 1.

GASSING ACCIDENT AT CHEMICAL WORKS.—James Haynes, aged 44 years, was engaged in cleaning out one of the stills at the chemical works of Messrs. Hardman and Holden, Ltd., Miles Platting, Manchester, on Tuesday, when he was overcome by the fumes. A workman named Thomas Angell went to Haynes' assistance, but he, too, was soon overcome, and had to be removed in the ambulance to Ancoats Hospital. Several other workmen appeared on the scene, and eventually Haynes was got out. A doctor was summoned, but life was extinct.

INCREASE IN URALS PLATINUM OUTPUT.—*Reuter's Agency* learns that, according to a telegram from Omsk from the Minister of Commerce in Admiral Koltchak's Government, the improvement in platinum mining will result in a considerable increase in the output of this metal. It is pointed out that the platinum obtained in the Urals amounts to about 95 per cent. of the quantity obtained in the whole world. The Minister adds that the increase in the output of platinum will undoubtedly considerably raise the rate of exchange of the rouble.

HIGHER EDUCATION OF EX-SERVICE STUDENTS.—A circular has been issued by the Board of Education in regard to the higher education of ex-service students at institutions of lower than university standard. In accordance with the suggestions made, the Birmingham Education Committee are arranging to provide in the main departments of the Municipal Technical School full-time day courses in industrial chemistry for such students. The fee payable has been fixed at £20. per session, and in the case of approved ex-service students this will be payable by the Board of Education.

POPULAR CHEMICAL DICTIONARY.—We understand that Mr. C. T. Kingzett, F.I.C., the chairman of the Sanitas Company, Ltd., and one of the original founders of the Institute of Chemistry, is preparing for early publication by Messrs. Bailliere, Tindall, and Cox, London, an abridged "Popular Chemical Dictionary" in a single volume. Apart from the educative value of such a production, including its use in schools and public libraries, it should be of great service as a work of reference not only to practical chemists but also to brokers, dealers, and business men generally who are naturally interested in the thousand and one articles finding concise description in such a book.

FRENCH MARKET FOR SULPHUR AND SULPHATE OF COPPER.—Investigation into the Bordeaux market disclose that there is at present no market for sulphur products, and, in fact, the same condition appears to hold for all of France in any large commercial way. This is due to the fact that the French Government control the buying and distribution of these products. In regard to copper sulphate, the Government have purchased a large quantity at a high figure, nearly enough for next season's needs for all of France, and, it appears, will not let down the bars for importation until their contracted stock is disposed of. Sulphur is, and will continue to be until July 31, 1919, under Government control. The purchase and distribution is done by L'Office Central des Produits Chimiques Agricoles, 42bis Rue de Bourgogne, Paris (VIIe).—*U.S. Com. Rep.*

SUGAR REFINING IN THE UNITED KINGDOM.—Dealing with the output of sugar in this country, a report of the Select Committee on National Expenditure, just issued, states that the annual capacity of the eleven refineries in the United Kingdom is about 900,000 tons, approximately one-half of the former requirements of refined sugar. They have been under control during the war, and were able at one period to produce nearly the whole of the refined sugar consumed, which was approximately 1,100,000 tons. More recently the larger consumption of sugar has made necessary the purchase of large quantities of Cuban sugar, refined in the United States of America, at a cost of 5s. 4½d. per cwt. in excess of the cost of similar sugar produced from British refineries. On the other hand, when freights are available, the present cost in this country of Java sugar, refined in the East Indies, is somewhat less than the cost of Java sugar refined in the United Kingdom, though the latter is of better quality. No export of beet sugar from Central Europe can be expected for some time.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS.

(Concluded from page 552, Vol. 'LXIV.)

REPORTS OF COMPANIES.

Electro Bleach and By-products, Ltd.

The fifth ordinary annual general meeting was held on June 27 at the Midland Hotel, Manchester. Mr. H. J. Mackinder, M.P., the chairman of the company, presided.

The Chairman, in moving the adoption of the report and the accounts, said they met at a critical time. He thought it was pertinent to remind them that their company was a peace company, and not a war company. It was floated in the spring of 1914, some four months before the war. That fact had told against them until the present time, but he hoped and believed that henceforth it would turn to their advantage. There were many months of hard work and anxiety which followed the outbreak of war, but they went through with it. Then, after a couple of years, came the excess profits duty. He had said they were a peace company, cautiously based on the smallest capital that was practicable. Of course, they had no pre-war year as a standard of profit, and therefore they had to be content with a small percentage on their small capital, and to hand over a large part of their profits to the State. Yet their total profits were at no time during the war in excess of the estimates published in their prospectus, and made, therefore, in times of peace. They made no complaint of the contributions to the State; but he said with some pride that if they had made good to-day, as they had, it was not by any war profits, but in spite of the war. The only advantage they had had in their favour was that their products were of equal importance both in war and peace. Throughout they had tried to treat the Government fairly, and he claimed that they had rendered a real service, in proportion to their size, to the armies in the field. At the same time, they had made it their policy to be considerate to their private customers, and he hoped and believed that they had earned the goodwill of these customers.

In the balance-sheet the two items which would no doubt claim their attention first were the additions to the plant, valued at over £70,000., and the loan from the Ministry of Munitions amounting to over £35,000. Those two items, appearing for the first time, represented the conclusion of the transactions which had, in fact, extended over the last three years. In regard to the additions to the plant, the amount of £70,000 had been arrived at after such writing-down as they believed would cover any likely decline in the value during the coming years. In some cases, in the case of large sums, the writing-down had amounted to 50 per cent. He might usefully remind them in that connection that the amount of £198,000, which stood in their balance-sheet as the value of their plant, was based on somewhat similar facts. It was not based on the first cost, with additions, less depreciation, but it was based on the prices which that company paid for the predecessor's company's plant being taken over, and that represented a considerable writing down on the original cost. As to the item of £12,841. for depreciation during the year, it must be remembered that that was a sum in excess of the cost of repair. On the other side of the balance-sheet they would see that before arriving at the gross profits they had charged the cost of ordinary repairs. Then there was the sum of £10,000. as a special appropriation out of the year's profits for deferred repairs. That large sum had been allowed by the Inland Revenue authorities in order to meet the cost and to make the damage good of certain parts of the plant working under war conditions. They would understand that in certain crises of the war it was essential to press forward without any regard to economic consequences. When they considered all the facts, he thought they would realise that the directors were fully justified. In regard to the Government loan, the Board were considering the best and the wisest course to be taken in the matter of interest and repayment. The Ministry of Munitions had treated them with every consideration. He thought he was justified in saying that, in view of their sound financial condition, that item in their liabilities gave them little concern. In regard to the whole financial position of the company, he felt justified in saying that they started their peace career with no mean achievements behind them. During the critical years of the war, when they had been subjected to excess profits duty taken from the natural growth of the company, which they budgeted for when no war was in sight, they had succeeded in paying off the whole of their preliminary expenses. They had contributed to the sinking fund of their debentures. They had already bought the necessary amount of debentures for the coming year, so that at the present moment they had paid off £10,000. out of their £60,000.

debentures. They had made a beginning in the way of a reserve fund, and were placing a sum to reserve amounting to £10,000. They had preserved—and, indeed, increased—their working capital. Capital was, of course, represented by the two items stock in trade and cash in bank, amounting to over £56,000. The items sundry creditors and sundry debtors practically balanced if they allowed for certain sums. With regard to the plant, it was at the present time in better order than it ever had been, and it was certainly much larger. They would see that the company had constructed fresh water reservoirs, which were of great use during the recent drought. The brine flow was quite satisfactory, and they had sunk a third shaft, which was now in operation. They had not to work all three shafts at once. With regard to present trade, although only half of the current year had passed he felt justified in telling them that on the whole the company had not been unprosperous.

On the motion of Mr. Cubitt, the report was adopted. Mr. H. J. Mackinder was re-elected a director, and Messrs. Fred Scott and Co. were reappointed as auditors.

Lever Brothers, Ltd.

An extraordinary general meeting was held on June 26 at Port Sunlight, the Hon. W. Hulme Lever presiding in the absence of Lord Leverhulme. The business of the meeting was to consider the directors' proposal to increase the capital of the company from £60,000,000. to £100,000,000.

Mr. Lever, in submitting the resolutions embodying this proposal, said some of the shareholders might be inclined to ask why they needed this further increase of capital so soon after the increase made in February last, and if it were needed why it was not proposed then. The directors believed that the capital authorised in February required strengthening by further issues from time to time with capital ranking below already existing capital and below the new capital authorised last February. They were constantly requiring to issue capital for the purpose of purchasing businesses, and it was thought wise to create this new capital for that purpose. The effect would be to strengthen the position of the existing preference shareholders as they purchased new businesses from time to time by the issue of shares ranking below the shares already existing. The directors had always hesitated to issue shares for the purchase of business when such shares ranked *pari passu* with shares quoted on the market, as that disturbed the quotations of such shares, and generally they preferred to avoid doing so. He did not say the issue of new capital would entirely avoid part of the purchase money for businesses being paid in cash, but as much as possible of the purchase price could be paid in shares ranking behind the existing preference and preferred ordinary shares. The scheme was in consonance with the policy of the firm which had enabled them to protect the interests of shareholders. They had the unanimous approval of the ordinary shareholders, which might not be the case at a future date if there were any change in the ownership of the ordinary shares. The result of the scheme would be greater security for the existing preference shareholders, better and more efficient service to the public, ability to sell at the lowest world's price of production, and on those lines to secure a solid and progressive character of business on a sound basis of finance.

Mr. John Gray seconded.

Mr. Arthur W. Colegate, a shareholder, asked if it would not be possible to give a little more light upon why it was necessary to increase the unissued amount of capital. The company had about £60,000,000. of nominal capital, of which only about £18,000,000. had been issued. That left, roughly, £42,000,000. of unissued capital, which, he thought, was ample, and he was not quite clear why a further amount of nominal capital was required.

The Chairman explained that the time was opportune to make the increase, and it might not be opportune later. Although the sum seemed large, the directors felt they were justified in asking the meeting to authorise it, bearing in mind the extensive operations of the company not only in this country, but throughout the world.

The resolutions were carried.

Fortuna Nitrate Co., Ltd.

Directors report for year 1918 that gross profit, inclusive of transfer fees, amounts to £61,534.; deducting London expenses, income tax, and depreciation charges, amounting to £25,128., and adding £3,888. brought in, there is £40,294. Directors recommend dividend of 7½ per cent., less tax; for-

Magnetic Separator Pulley

in Conveyor System saves Crushing Plant from injury, by removing stray iron and steel from amongst Green Bones.

No iron or steel can escape the attraction of the pulley, even though it be embedded in the bone.

The action is continuous and quite automatic.

It obviates hand picking and is more economical.

Many chemical plants use these pulleys to separate or refine innumerable materials.

ward, £32,064. Directors consider it prudent to carry forward this balance in view of abnormal conditions ruling in nitrate industry at present time. Net production of nitrate at the company's oficinas was 1,207,788 quintals. Profit has been taken on 1,165,613 quintals, and unsold stock of 42,175 quintals on hand at December 31 has been valued at approximate cost.

Santa Rita Nitrate Co., Ltd.

For year to December 31 last the gross trading profits, including interest, were £12,881.; less London charges and income tax, £3,911.; net profit, £8,970.; and £1,231, was brought in, making £10,201. Dividend of 5 per cent., less tax; forward, £5,201. The oficina was closed at the end of the year, and manufacturing operations will not be resumed until the large coast stocks have been materially reduced. The extraction of raw material is being continued.

NEW COMPANIES.

Dynevov Tinplate Company, Ltd.—Private company. Capital £50,000., £1. shares. Office: Dynevov Tinplate Works, Pantyffnon.

East Anglian Chemical Company, Ltd.—Private company. Capital £15,000., £1. shares (3,000 7 per cent. preference). Object: To acquire that portion of the business of Mary H. Wilson which concerns the operation of the plant at Sutton Bridge, Lincolnshire, for manufacturing sulphuric acid.

Isthmus Size and Chemical Company, Ltd.—Private company. Capital £15,000., £1. shares. Object: To acquire the business of W. F. Clayton and G. E. Sellers, carried on under similar style at Huddersfield.

J. D. Tipping, Ltd.—Private company. Capital £1,000., £1. shares. Manufacturing chemists, and merchants of boot polishes and furniture cream, etc. Solicitor: E. G. Twemlow, 78, King Street, Manchester.

Narborough Syndicate, Ltd.—Private company. Capital £2,200., in 2,000 preference shares of £1. each and 4,000 ordinary shares of 1s. each. Object: To search for minerals, oils, and natural gas in the U.K. or elsewhere. Solicitor: F. H. Stollard, 56, Gresham Street, E.C.

National Felspar Company, Ltd.—Private company. Capital £12,100., in 12,000 shares of £1. and 2,000 deferred shares of 1s. each. Agreement with L. W. Carder, H. J. Dixon, and the Belleek Felspar Company, Ltd., and to acquire and work felspar mines in Ireland. Solicitors: Foss and Company, 5, Fenchurch Street, E.C.

Everest and Company, Ltd.—Private company. Capital £6,000., £1. shares. Caramel and burnt sugar manufacturers. Office: 21, Northern Road, Plaistow.

Warren Cement Works, Ltd.—Private company. Capital £150,000., £1. shares (50,000 10 per cent. cumulative preference). Object: To take over the business of Portland cement and basic slag manufacturers and merchants carried on by Otto Trechmann. Office: Warren Cement Works, Hart Road, Hartlepool.

Acton Aluminium and Bronze Company, Ltd.—Private company. Capital £10,000., £1. shares. Office: Bank Buildings, 186, High Street, Acton.

Anglo-Norwegian Electro Chemical and Finance Company, Ltd.—Private company. Capital £20,000., £1. shares. Office: 6, Great St. Helens, E.C.

Falcon Chemical and Rubber Company, Ltd.—Private company. Capital £5,000., £1. shares. Office: 230-232, Produce Exchange, Manchester.

Jennison, Ltd.—Private company. Capital £2,000., £1. shares. Oil, water, paint, colour, grease, and varnish merchants, etc. Office: 4, Waltham Street, Hull.

Kerrow and Ennis China Clay Company Ltd.—Private company. Capital £10,000., £1. shares. Office: 85, London Wall, E.C. 2.

John Gonnella and Company, Ltd.—Private company. Capital £10,000., £1. shares. Oil extractors, importers, and refiners, tallow melters, soap and grease manufacturers, etc. Registered office: 150, Baird Street, Glasgow.

Norfolk Oil Share Syndicate, Ltd.—Private company. Capital £6,000., £1. shares. Office: Castle Chambers, Norwich.

Plasmet, Ltd.—Private company. Capital £5,000., in 2,000 preference shares of £1. each and 6,000 ordinary shares of 10s. each. Object: To acquire the formula of and the right to manufacture 'metallic cement' called "Plasmet." Registered office: 45, Brecknock Road, N.W. 7.

Ricarbo, Ltd.—Private company. Capital £10,000., £1. shares. Manufacturers of and dealers in inks, carbon and ink papers, etc. Office: 16, Cobden Street, Leicester.

South Yorkshire Chemical Works, Ltd.—Private company. Capital £350,000., £1. shares (200,000 preference). Object: To acquire the business of an owner of chemical and by-products works carried on by the Right Hon. Earl Fitzwilliam, K.C.V.O., D.S.O., at Parkgate, near Rotherham. Office: 20, Conduit Street, W. 1.

Wells Vegetable Fuel Power Company, Ltd.—Private company. Capital £60,000., £1. shares. Objects: To take over inventions and discoveries in and relating to the carbonisation of wood and the like. Manufacturers of and dealers in charcoal, etc. Solicitors: Rhys Roberts and Co., 63, Queen Victoria Street, E.C.

John and James White, Ltd.—Private company. Capital £600,000., £1. shares. Object: To acquire the business of manufacturers of chemical products and drugs, chemical brokers, drysalts, and merchants carried on at 7, West George Street, Glasgow, and at Shawfield, Rutherglen, and elsewhere, as "John and James White." Registered office: 7, West George Street, Glasgow.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 73, Basinghall Street, London, E.C. 2, whence further information may be obtained:—

British India.

A firm in Calcutta, claiming to be one of the largest firms of European wholesale and retail chemists in India, are desirous of accepting agencies, on consignment terms, for drugs and chemicals. (Reference No. 1215.)

A firm in Calcutta, claiming to be in close connection with Government departments, railways, shipping companies, etc., and to have special facilities for distribution in all the large centres in India, are desirous of accepting sole agencies to cover Bengal, Bihar, Orissa and Burma, on consignment and on a commission basis, for heavy chemicals. (Reference No. 1218.)

South Africa.

A chemist and manufacturers' agent in Johannesburg desires to get into touch with United Kingdom manufacturers of mining chemicals, rubber goods, dyes, celluloid goods, paints, etc., with a view to obtaining agencies in South Africa. The applicant is at present in the United Kingdom and is open to interviews. (Reference No. 1230.)

Belgium.

An agent at Verviers desires to obtain an agency, with dépôt, for United Kingdom manufacturers of ultramarine blue in bulk and in small packages (500 kilos); extracts for tanners and dyers (1,000 kilos); and pure white lead and linseed oil (5,000 kilos). (Reference No. 1240.)

An agent at Liège desires to obtain agencies for United Kingdom manufacturers of soft pig lead and antimony. (Reference No. 1242.)

Netherlands.

A merchant in Amsterdam wishes to secure the representation in Holland of the following goods of United Kingdom manufacture: Chemicals, drugs, and toilet soap. (Reference No. 1251.)

Chili.

A firm in Santiago desire to get into touch with United Kingdom manufacturers of paints, varnishes and oils, with a view to representing them in Chili. (Reference No. 1203.)

Roumania.

H.M. Vice-Consul at Galatz reports that an agent in that town desires to obtain agencies, on a commission and consignment basis, for United Kingdom manufacturers of tinplates, terneplates, blackplates, lead pipes, sulphate of copper, caustic soda, beef tallow, and general chemicals. (Reference No. 1190.)

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—A few steamers seem to have been chartered to load nitrate for Europe in the later summer months, but as only 10,000 tons in all were shipped from Chili in the first half of June, that month's exports will obviously not have materially relieved the top-heavy statistical position; the stocks on the West Coast reaching, as already stated, the unprecedented total of about 1½ million tons, and will continue to increase until tonnage becomes plentiful, and this by common consent is not likely to be the case for many months to come. It is therefore difficult to see how the estimated world's consumption of two million tons in the current twelve months is to be met, even in the highly improbable event of buyers being prepared to pay the prices inseparable from high freights. Unfortunately, the outlook is further obscured by the friction existing between the Chilean Government and the newly formed Producers' Association, comprising, it appears, after all, not 83, but only 73 per cent. of the total output capacity of the industry. The so-called "centralisation of sales" has, as we expected, already resulted in a complete fiasco, the Government having effected large forward sales for account of the native and German companies outside the "ring" at prices considerably below the prices fixed (*sic*) by the latter. The syndicated producers have admittedly not sold a quintal of nitrate since last autumn, many of them have closed their works, and the situation, which will be dealt with in detail in our usual half-yearly review towards the end of the month, may well be described as chaotic. As shown by the official statements at recent company meetings, the producers themselves are, in fact, "crying malodorous fish!"

Spanish and French Fertiliser Companies.—The Spanish Union of Fertiliser Factories, which works practically on French capital, has establishments in Malaga, Alicante, Valencia, and Seville, which, besides the production of sulphuric acid, make or can produce 167,000 tons of superphosphates. The sulphuric acid plants work up pyrites obtained in the company's own mines, and the production exceeds the requirements for fertiliser output. The concern is a subsidiary of the Algerian-Tunisian Omnium, which controls the great phosphate deposits of Constantine, and delivers the raw material to the Spanish Fertiliser Union. The concern worked at a loss in 1914. The year 1915 brought about a great increase in the production, and compensated for the loss in the preceding years, and in 1916 the great rise in the price of superphosphates made the declaration of a 15 per cent. dividend possible. From the report published in October, 1918, of the 1917 business year, it can be seen that in the first-half of the year considerable difficulties were met with in supplying the factories with raw phosphates, so that the regular exploitation during the autumn became an anxious question. The treaty of commerce with France helped the undertaking by the assurance of a good supply of crude phosphates. Work could only be kept going in Seville because they were able to use the Cáceres phosphates there. The production of sulphuric acid, as well as that of superphosphates, was inferior to the usual capacity of the factories, and amounted to 66,000 tons, distributed as follows: Valencia, 25,000 tons; Alicante and Seville, 15,000 tons each; Malaga, 11,000 tons. 84,500 tons of superphosphates were made, and 89,993 tons were sold, as well as a portion of the sulphuric acid. As the rise in the price of superphosphates kept pace with the increase in the cost of raw material, the working year brought a profit of 2,900,000 pesetas, against 3,860,000 pesetas in the preceding year. The dividend was 10 per cent. In the various factories all preparations have been made for working intensively in peace time. In Valencia and Malaga new drying and concentration plants have been installed for the production of a high percentage superphosphate, and in Alicante roasters have been installed for the pyrites found in the district.

The Cia. Navarra de Abonos quimicos propose placing a weir on the Ebro River in the district of Viana. The plant will develop 86,000 H.P., and is to be used for the production of atmospheric nitrogen in order to make fertilisers. The cost of the weir, including hydraulic and electrical plants, is estimated at 5,000,000 pesetas, and that of the fertiliser factory at 3,000,000 pesetas.

The Phosphates du Dan Company shows a profit on its 1918 working year of 128,282 francs, against 8,058 francs only in 1917. The stock of phosphates, valued at 1,047,207 francs, is down by 350,025 francs in value. This reduction is explained

by a reduced output and the improvement in transport facilities which have made it possible to increase the sales during the last quarter of 1918.

Sulphate of Ammonia.—There is not much moving in the sulphate of ammonia market this week, but supplies appear to be obtainable with fair regularity. The statement is made that the quantity of sulphate to be sold at £17. per ton to farmers has been disposed of. The price for July-September delivery is now £19. 10s. per ton. News from the other side of the Atlantic tells that export trading has developed to considerable proportions, with a steady volume of business passing, whilst domestic requirements there are confined to moderate quantities. Prices are firmly maintained, both for double bags and in bulk.

Slag and Superphosphate.—With season prices now fixed for basic slag, country merchants, and many farmers as well, are covering their requirements ahead, and there is not much to be reported in connection with the section beyond that. There is talk of a larger output next season. Superphosphate is quiet, but it is reported that the market will be glad to be reassured over the arrangements for a steady importation of rock phosphates.

Potash.—Manures in this section are unchanged on the week, but the supply is reported to be rather more ample. Stocks of sulphate of potash are improving, as also are stocks of kainit.

Bone Meals.—Indian bone meal is still scarce, and £15. 10s. is the price quoted in some districts. At the same time, Liverpool is offering some quantities of pure dissolved bones, ½-3 per cent. ammonia and 35 per cent. phosphate, in bags, at £12. to £13. 10s. per ton, ex works; with pure steamed meal, 1 per cent. ammonia and 60 per cent. phosphate, in bags, at £11. to £11. 5s. per ton, ex works. There does not seem to be much tendency for bone meal prices to fall at present in default of Indian shipments, and, in fact, in one quarter a further advance is expected.

Blood and Tankage.—There is a good sale for what supplies of dried blood are available, but the import trade is slow. Some sellers are asking 25s. per unit for ammonia. Foreign dry tankages are quoted at 20s. to 22s. 6d. per unit of ammonia, and 2s. to 2s. 3d. per unit of phosphate, the quotations in each case being for bulk lots. Fish meals are in more request at prices reported to be round about 25s. per unit of ammonia and 2s. 3d. for phosphates. Something of the same figures are mentioned for meat meals.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

The South Wales tinplate workers have passed a resolution absolutely repudiating the decisions of the Industrial Council and are calling upon the workmen's representatives to re-open negotiations immediately upon the new claims, threatening that unless this is done and the proposed delegation to America withdrawn they will withdraw their labour. All the manufacturers have been acquainted with the facts and the decision of the men is causing a feeling of much uneasiness and uncertainty in the trade. The works recently acquired by Messrs. Baldwins, Ltd., in Toronto are being converted into an up-to-date tinplate factory. This is an important development and may have considerable effect on the home industry.

The copper industry is very quiet, there being no appreciable quantities of ores arriving, and as far as can be ascertained several weeks will elapse before any improvement can be effected at the local works.

Much activity prevails at all the patent fuel works, the foreign demand being on the increase. Important experiments are being undertaken by experts in connection with pitch wart disease. Several years ago this disease was much more prevalent in South Wales than is the case now, and the experiments are being made with the object of still further decreasing the liability of fuel workers to it.

The business of zinc oxide manufacturers carried on at Landore by Messrs. John R. Down and Co., has been taken over by a new company called the Landore Zinc Works Ltd., with a capital of £100,000. in £1. shares. Messrs. J. R. Down and A. S. Young, of Carshalton, Surrey, are the first directors.

Lead workers are being steadily employed and prices for the metal have an upward tendency. During the week 102 tons of lead ore arrived at Swansea from Laxey for Messrs. Vivian and Sons.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

The specifications of the following applications are not printed by the Patent Office until the complete specifications have been accepted.

June 23rd to 25th (inclusive).

- Treating Tin Scruff. Clegg, G. H. 15,946.
 Ethyl Alcohol from Acetaldehyde. Compagnie des Produits Chimiques d'Alais et de la Camargue. 15,877.
 Separating Solids from Liquids. Conte, J. Y. 16,015.
 Hydro-extractors. Conte, J. Y. 16,016.
 Treatment of Argentiferous Sulphide Ores. Elmore, F. E. 15,783.
 Electro-deposition of Metals. Jacombs, J. H. B. 15,823.
 Separation in Pure State of Ortho- and Para-isomerides Obtained in Manufacture of Benzenoid Compounds. Jones, W. J.; and Stephen, H. 15,819.
 Manufacture of Resin. Koppers Co. 15,860.
 Roasting, Calcination, or Heat Treatment of Ores, etc., Bearing Sulphur Lines. E. W. L. 16,032.
 Continuous Defecation of Sugar Solutions. Marks, E. C. R. (Industrial Apparatus Corporation). 15,766.
 Fixation of Nitrogen. Marks, E. C. R. (Nitrogen Products Co.). 15,765.
 Methods of Forming Esters. Marks, E. C. R. (U.S. Industrial Alcohol Co.). 15,774.
 Synthesising Ammonia. Nitrogen Corporation. 16,001.
 Ammonia-nitrate Fertilisers. Norsk Hydro-Elektrisk Kvalstoftafabrik. 16,021.
 Mechanical Appliance for Boiling, Heating, or Smelting Liquids or Metal, Producing Steam, or Cooling Liquids. Nutt, B. J. B. 15,890.
 Manufacture of Anthranol. Perkin, A. G. 16,042.
 Distilling Carbonaceous Material. Perry, W. P. 15,985.
 Moulded Articles from Acid-proof Cement. Richards, W. E. Windsor. 15,909.
 Calcining Carbonates of Calcium and Zinc, etc. Southern, F. G. 16,039.
 Continuous Process for Manufacture of Esters. U.S. Industrial Alcohol Co. 15,775.
 Apparatus for Manufacture of Esters. U.S. Industrial Alcohol Co. 15,776, 15,777.
 Electrolysing Liquids. Withers, J. S. (National Electro-Products, Ltd.) 16,154.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane. W.C.

1916.

- Production of Light Mineral Oils from Heavier Oils. Maxim, S., and Crosce, A. W. (legal representatives of the late Sir H. S. Maxim). 8,477. 128,227

1917.

- Treatment of Solid Paraffins. Elborne, W. 8,693. 128,239
 Treatment and Production of Hydrocarbons. Forwood, G. F., and Taplay, J. G. 9,598. 128,255
 Drying Trinitrotoluene. Clayton Aniline Co., and Schedler, A. 9,732. 128,263
 Organic Acid Chlorides. Durrans, T. H., and Boake, Roberts and Co., A. 9,815. 128,270
 Preparing Hydrogen from Carbon or Carbon-containing Substances by the Action of Water or Water Vapour thereon. Prins, H. J. 9,896. 128,273
 Preparation of Acetic Anhydride and Acetyl Chloride. Durrans, T. H., and Boake, Roberts and Co., A. 10,196. 128,282
 Explosives. Marin, A. J. 10,271. 108,853
 Fuel Oil from Crude Oils. Tinken, F. 10,327. 128,288
 Protecting Copper or Its Alloys from Attack by Atmospheres or Liquids. Imperial Trust for the Encouragement of Scientific and Industrial Research, Institute of Metals, Bengough, G. D., and Hudson, O. F. 10,576. 128,297
 Utilisation of Nitre Cake. Morgan, J. S. 10,803. 128,302
 Continuous Process and Plant for the Production of Picric Acid or Other Products of Nitration. Brookes Chemicals, Ltd., and Brooke, N. 10,811. 128,303
 Regenerating Oxide of Nickel Catalysts Employed in the Hydrogenation of Fatty Bodies. Soc. Industrielle de Produits Chimiques. 16,149. 112,768
 Production of Mineral Oils. Carper, J. B. 18,688. 128,326

1918.

- Anhydrous Magnesium Chloride. Hulin, P. L. 467. 128,327
 Zinc Lead Pigments. New Jersey Zinc Co. 6,270. 120,194
 Production of Articles from Viscose. Borzykowski, B. 6,346. 116,268
 Dissolving Chemicals and Elevating the Resulting Solutions. Thorold, F. W., and Sinclair, J. M. 9,209. 128,351
 Separating the Constituents of Mixtures of Volatile Liquids. Green, A. G., and Levinstein, Ltd. 9,689. 128,362
 Measuring and Mixing Liquids. Smith, A. E. 9,876. 128,370
 Preparation of Amines. Rintoul, W., Thomas, J., and Nobel's Explosives Co. 9,895. 128,372
 Concentration of Sulphuric and Other Acids. Davis, G. K. 10,127. 128,396
 Extracting Fat from Bones and Other Material. Powling, W. T., and Powling, B. B. 10,129. 128,397

- Treatment of Liquor from Plants for Purifying Gases from Producers or the Like. Holmes, D. M. 10,208. 128,401
 Manufacture of Acetone and Other Products by Fermentation. Desborough, A. P. H., Reilly, J., Thaysen, A. C., and Henley, F. E. 10,219. 128,403
 Compositions Containing Phenol Formaldehyde Condensation Products. Scott, G. L. 15,449. 128,477
 Antimony Colours. Morris, E. F. 16,334. 128,482
 Fuel Briquettes. Bibb, D. H. 16,809. 128,485

1919.

- Extraction of Cyanides. Jackson, W. J. Mellersh- (Air Reduction Co.) 381. 128,507
 Vulcanising Rubber with Aid of an Accelerator. Hasselt, J. P. B. van 1,008. 126,606

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Picric Acid Manufacture. P. Ramy, London. British Patent, 125,461, of 1916.

Picric acid is obtained by heating sodium or potassium nitrate with sodium or potassium bisulphate, and passing the resulting mixture of nitrogen oxides and oxygen into heated benzene containing a catalyst consisting of copper, silver, or mercury, or nitrates thereof, or other copper, silver, mercury, or aluminium salt.

Charcoal Retorts. A. B. Roxburgh, Monkseaton; T. Sanderson, Gosforth; and F. H. Sanderson, Eshott, Felton, all in Northumberland. British Patent, 125,439, of 1916.

A charcoal retort *a*, which may be vertical or inclined, is externally heated, so that there is a gradual rise in temperature downwards to a zone of maximum heat, and fed with wood which descends by gravity and substantially fills the cross-section of the retort; the charging and discharging of the retort are effected so that the retort is worked continuously. Fig. 1 shows a vertical cast-iron retort *a* in a

fire-brick setting *b*, and heated by means of gas-burners *d* arranged round a flue *c* about the lower and intermediate parts of the retort; the gas supplied to the burners is the gas given off from the wood after such gas has been treated in condensing apparatus for recovery of tar and wood vinegar. Wood is fed into the retort from a

hopper *f* having a cover *g*, and provided with a valve *h* for controlling the wood supply. At the bottom of the retort is a discharge and cooling chamber *i*, of about half the capacity of the hopper *f*; this chamber is provided with a cover *j* for excluding air from the chamber and a valve *k* for regulating the discharge of charcoal. An air jacket *l*, with apertures *l^1* for admitting air, surrounds the chamber *i*; the hot air from this chamber passes through apertures *l^2* into the chamber *i*. Water or steam may be injected into the chamber *i*.

Nickel Extraction. H. W. C. Annable, Egham, Surrey, and Nickel Concentration, Ltd., London. British Pat. 125,119, of 1916.

Silicate ores of nickel, such as garnierite, are heated in a furnace in the presence of moist sulphuretted hydrogen and preferably a small quantity of a sodium or potassium salt. Suitable salts for this purpose are sodium chloride, which may be used in the form of sea-water, sodium carbonate, sodium sulphate, and the corresponding salts of potassium. The process is preferably carried out by mixing the ore with a sulphur-bearing substance, such as iron pyrites or copper pyrites adding a small quantity of sodium or potassium salt, and heating in a furnace through which a current of steam is passed; when carbonate is employed, sulphur may be used instead of the pyrites. The mass resulting from the operation, containing sulphides of iron and nickel, is roasted to a temperature necessary to convert the sulphides into sulphates

and to decompose the sulphate of iron, but not the sulphate of nickel. The hot mass is discharged into water for dissolving out the sulphate of nickel; in some cases, a basic sulphate of nickel is formed during the roast and, in such cases, the basic sulphate may be dissolved by adding hydrochloric acid to the water; this acid may be obtained from the gases from the furnace in which the ore is heated with iron pyrites and salt in a current of steam. The nickel may be recovered from the solution in several ways. It may be precipitated as carbonate, by adding magnesite, or as sulphide, by adding sodium sulphide; or the furnace gases may be passed into the solution either directly or after removal of hydrochloric acid. If the acid is thus removed, the nickel solution should be neutralised, e.g., by the addition of a little chalk before passing in the furnace gases; and a quantity of chalk more than sufficient to neutralise the acid is added to the solution, when the furnace gases are used directly. The precipitated salt of nickel is dried and heated in the air to obtain nickel oxide, which is found to contain approximately 90 per cent. of nickel oxide, and similarly, when the nickel is precipitated as carbonate, this is separated, dried, and ignited to obtain nickel oxide. Some of the magnesium in the ore is converted, during the process, into magnesium sulphate.

Nitrating and Mixing Machines. Nobel's Explosives Company, Ltd., Glasgow; J. N. Lyall, A. Wilson, J. H. O'Connor, and J. McKillop, Pembrey. British Patent, 125,094, of 1916.

In nitrating, mixing, and similar apparatus, the course of the acid, etc., supplied to the apparatus is controlled by the speed of the stirring mechanism, or by the pressure of the air or the like when the mixing is effected, by compressed air, etc. As shown in Figs. 3 and 4, the sleeve C of a governor B on the stirring-shaft A is connected by a bell-crank lever D and link D' to the outer end of a swivelling bend E, forming part of the acid-supplying pipe F. The pipe E delivers into a feed and overflow-box divided into two compartments H, I by a partition J. A pipe L leads from the compartment

Fig. 3.

Fig. 4.

H to the nitrator K, and a pipe M from the compartment J to an overflow tank, from which the acid is returned to the supply tank. Should the speed of the stirrer A fall below a certain point, the governor B moves the outlet end of the bend E over the overflow compartment I. Liquid seals Q, R may be provided at the supply and delivery ends of the bend E. A depending lug T on the bend E has a pivot G engaging a piece W on the cover of the nitrator K, and rollers at the outer end of the bend run on a track. An oil bath X is formed in the piece W, and a hood Y is screwed on the pin G. The outlet end Z of the bend E may be flattened to ensure delivery of the acid to one or other side of the partition J.

Saponifying Esters. C. F. Cross and C. Dreyfus, London. British Patent, 125,153, of 1916.

Fatty or oily glycerides are saponified by the joint action of methyl or ethyl alcohol, pure or dilute, and an alkali or base in amount less than the equivalent of the fatty acid: glycerine, a salt of the acid, and the methyl or ethyl ester of the acid, are thereby obtained. The glycerides are treated at ordinary temperature, or if solid are treated at a temperature at or above the melting-point; the amount of alcohol employed is also small, the materials are thoroughly mixed and emulsified in a vessel provided with an agitator, and the mixture may then be run into other vessels and allowed to stand until the reaction is complete. The products may be separated by dissolving the soap and glycerine in water, removing the undissolved esters, and then separating the soap or its fatty acid from the glycerine. The process may also be

applied to cellulose acetate; the textile uses and dyeing properties of an acetate silk may thus be varied; the process may be carried out by covering the thread with alcohol, adding the fractional equivalent of caustic soda, and agitating or circulating the liquid until the desired result is attained; the resulting cellulose product contains alkali. Specification 3367/07 is referred to. The Provisional Specification does not confine the invention to the above mentioned types of esters.

Sulphate of Ammonia. J. T. Sheard, Birley Carr, near Sheffield. British Patent, 124,946, of 1918.

To reduce the amount of free acid contained in drained ammonium sulphate crystals, the magma of crystals enveloped in mother-liquor is sprayed with clean water immediately it is ejected from the saturator, and before any draining-away of mother-liquor has taken place. The water is supplied as a shower of intimately divided or atomised jets by a tube g conveying water under pressure, and having a flexible or swivelled end-piece terminating in a rose or other form of jet. The crystals may be removed from the saturator to the draining-table f by a scoop

or by a steam ejector, or the saturator a may be provided with a conical bottom i terminating in a discharge-pipe j fitted with a valve k.

Decolorising Carbon. Tai-Koo Sugar Refining Company, 8, Billiter Square, London. (A communication from M. Obrembski and H. C. Resker, Hongkong.) British Patent, 125,230, of 1918.

Decolorising carbon is prepared by impregnating vegetable material—for example, wood chips, sawdust, cocoanut husks, straw, or hay—with an equal weight of calcium chloride applied in aqueous solution and evaporating to dryness under vacuum, carbonising at 600-800° C., washing with acid and water, and finally drying and grinding.

Nitroglycerine Manufacture. J. G. Baxter, Gravesend, Kent. British Patent, 125,091, of 1916.

Apparatus for the continuous manufacture of nitroglycerine comprises the nitration vessel shown in Fig. 1, and the separator shown in Fig. 2. The nitration vessel is divided into two communicating compartments by an annular wall 6 provided with spaces 7 in its lower edge, and is furnished with cooling-coils 5, air-agitation pipes 8, inlet pipes

10, 11 for supply of mixed acid and glycerine, and an outflow pipe 12. A cross-wall 13 for preventing premature mixing of the acid and glycerine, thermometers 2, 3, a fume exit 1, and a discharge outlet 9, are also provided. The separator comprises a lower compartment 23, an upper compartment 28, and a neck 21 provided with an inspection window 22; the mixture of nitroglycerine and waste acid enters by the pipe 17 and separates; the acid flows away by a pipe 18, and the nitroglycerine by a pipe 19, to which is attached a rubber tube 20 which can be raised or lowered to regulate the outflow from the pipes 18, 19; a cooling-coil 25, thermometer 24, fume exit 27, and discharge outlet 26, are also provided.

Manufacture of Parchment Paper. Manchester Oxide Co. and R. H. Clayton, Miles Platting, Manchester, J. Huebner, Chaddle Hulme, Cheshire, and H. E. Williams, Withington, Manchester. British Patent, 124,979, of 1918.

In the manufacture of parchment paper, vulcanised fibre, etc., the paper is treated with solutions containing thiocyanates either in water or in a solution of another thiocyanate. The

solution may contain also a salt which does not adversely affect the action of the thiocyanate and may be acidified with acetic acid. Three examples are given. (1) The paper is passed for about 30 seconds through a solution of calcium thiocyanate heated to 130°C ., and of such a strength that it boils at 157°C . (2) The paper is passed for about 15 seconds through a solution containing one part by weight of mercuric thiocyanate and two parts by weight of magnesium thiocyanate heated to 130°C . and of such strength that it boils at 145°C . (3) A solution of equal parts by weight of calcium thiocyanate and calcium chloride heated to 130°C . and of such a strength that it boils at 157°C . is used. When the solution is acidified, four per cent. by volume of glacial acetic acid is added. In each case, the paper is washed and dried in the ordinary manner. Vulcanised fibre is manufactured from the parchment paper in the same manner in which such fibre is manufactured from paper treated with sulphuric acid or zinc chloride.

Hydrogen. C. Dellwik and S. Cutler, London. British Patent, 125,596, of 1916.

In preparing hydrogen from a mixture of hydrogen and air, such as the waste gases from balloons, the mixture is used as the reducing gas in the process of alternate reduction of iron oxide or other suitable material, and reoxidation by

means of steam with liberation of hydrogen. The mixture of hydrogen and air is passed into a gas-holder G, and is circulated by a pump E through a closed circuit comprising the gas-holder G, devices WS, which prevent a local explosion from spreading, a retort C containing iron oxide, and a scrubber SC. The circulation is continued until the gas becomes inactive. A supply of steam generated from the water condensed in the scrubber SC or from another source is then led into the retort C, and the hydrogen obtained is passed through a condenser K to a gas-holder H. If an explosion occurs in the retort C during the reduction, the safety-valve SV lifts, and water is forced from the water-seal vessel WS to form a second water-seal in the vessel ws.

Calcium Nitrate. J. G. Gillbert, Tottenham, London. British Patent, 124,780, of 1916.

Calcium nitrate is obtained by the addition of equivalent quantities of calcium chloride and sodium nitrate to a "nucleus solution" in such quantities as to produce a solution saturated with calcium nitrate at as high a temperature as practicable, say 80°C ., and the precipitated sodium chloride is removed. Water is then added in quantity sufficient to make the proportion of water to sodium chloride equal to that in the nucleus solution, and to provide four molecules of water of crystallisation for the calcium nitrate which is to be separated. The solution is then cooled to a predetermined temperature to separate the calcium nitrate, leaving the nucleus solution, which is used again, and so on indefinitely, the subsequent cycles, however, including a step of evaporating, before the separation of sodium chloride, a quantity of water equal to that which was added in the first cycle. The nucleus solution is a solution saturated with calcium nitrate, sodium nitrate, and sodium chloride if the separation of calcium nitrate is to be effected below 25°C ., or a solution saturated with calcium nitrate and sodium chloride if the separation of calcium nitrate is to be effected above 25°C . The separation cannot be effected above 30°C . in practical quantities.

Nitric Acid and Ammonium Sulphate Manufacture. A. T. Cocking and Kynoch, Ltd., Witton, Birmingham. British Patent, 125,444, of 1916.

Nitric acid is obtained from the atmosphere by first obtaining ammonium nitrate by a known process such as those described in Specifications 1820/14 and 14391/15—i.e., by using gas from a producer to drive an engine, to generate electric current which is supplied to an arc furnace for producing nitrogen oxides which are converted into nitric acid and combined with the ammonia obtained from the producer gas;

and then making nitric acid by heating the ammonium nitrate with excess of sulphuric acid under reduced pressure. The residue of acid ammonium sulphate may be neutralised with ammonia or used to obtain a nitrogenous superphosphate from natural phosphates.

Centrifugal Separators. R. A. Sturgeon, Southsea, Hampshire. British Patent, 125,502, of 1918.

Precipitants, coagulants, or the like are added to the material under treatment in a multistage separator before,

during, and/or after each stage. The hollow spindle B carrying the drum A is driven through gearing, and outside it is arranged the hollow tube E carrying the closing piston E^1 and a series of discs D^1 , D^2 ; the discs D^2 are in contact with the drum and have openings near the axis, and the discs D^1 do not meet the drum. The liquid under treatment enters from the tank G, through the outlet G^1 and the chamber C on the top of the drum, and passes successively outwardly and inwardly through the drum to the receiving channel J. Regagents from the tank P pass down the tubular shaft B by means of channels in the rod B^2 to openings M in the sleeve B at each or any stage. The sleeve E, disc E^1 , D^2 are movable axially from the drum to permit washing the solids from the drum; the washing liquid escapes from the outlets N, which are normally closed by the disc E^1 .

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Distilling Glycerine. Soc Francaise des Glycerines, Paris. British Patent, 125,574. Convention date, April 16, 1918.

The process of distilling glycerine constituting the parent invention is modified by maintaining the vessel A, Fig. 1,

in which water and other impurities are eliminated in the form of vapour, under a vacuum of about 50cm. of mercury, and at a temperature above 180°C ., and afterwards atomising the purified glycerine into the vessel B, in which the glycerine is distilled under a vacuum of 72cm. of mercury, solely by means of the pressure difference existing between the vessels A and B. The atomisation is thus effected without the use of steam or gas. The atomisers H are of the construction shown in Fig 3, the glycerine being admitted to the atomiser by the pipe X. The vessels B, A may be separate and independent instead of being arranged one within the other.

Picric Acid. F. Gros and Bouchardy, Paris. British Patent, 124,751. Convention date, March 23, 1918.

Picric acid is prepared by treating 1 : 2 : 4- or 1 : 2 : 6 dinitrophenol or a mixture with nitric acid saturated with nitrogen pentoxide.

Ozone. F. Gros and Bouchardy, Paris. British Patent, 124,752. Convention date, March 23, 1918.

In the manufacture of ozone from oxygen or air—e.g., by electric treatment—the yield is increased by a reduction of the pressure in the ozoniser to below 550mm. of mercury, preferably accompanied by refrigeration to at least -10°C .

GAZETTE NEWS.

LIMITED COMPANIES. — Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

Matches, Ltd.—Meeting of creditors, Ridgway Hotel, 40-42, King William Street, E.C., July 4, at 10 p.m.

Messina Copper Extensions, Ltd.—Resolved June 5: That the company be wound up. F. W. E. Morgan, 17, Eldon Street, E.C., liquidator. Meeting of creditors at liquidator's, June 26.

Regulas Metal and Plumbing Co., Ltd.—Resolved May 30, confirmed June 14: That the company be wound up. A. E. Tilley, 8, Staple Inn, Holborn, chartered accountant, liquidator. Meeting of creditors at liquidator's, June 30. Claims to liquidator by August 5.

Wohle Mineral Oil Products (1910), Ltd.—Resolved June 3, confirmed June 21: That the company be wound up. E. Hard, 17, Fenchurch Street, E.C., chartered accountant, liquidator.

DIVIDENDS.

SULPHIDE CORPORATION, LTD.—In view of the uncertainty of the metal position, and of the fact that owing to the maritime strike in Australia work at the Central Mine has been suspended since May 7, and as the time for the resumption of operations is uncertain, the directors have decided to declare only an interim dividend of 5 per cent. on preference in respect of year to June 30.

KYNOCH, LTD.—A dividend at rate of 14 per cent., less tax, on the amount for the time being paid up on ordinary shares for nine months to December 31.

NEW TRANSVAAL CHEMICAL CO., LTD.—Interim dividends for half-year to December 31 last of 3 per cent., less tax, on cumulative first preference, and of 4 per cent., less tax, on cumulative "A" preference.

RECKITT AND SONS, LTD.—Interim dividend of 6d. per share.

MARKET REPORTS.

TAR AND AMMONIA PRODUCTS

WEDNESDAY.

Benzole: London, 90%, 1s. 11d. to 2s.; North, 1s. 9d. to 1s. 10d.; 50%, 1s. 9d. to 1s. 10d.; North, 1s. 9d., naked. Carboic acid, crude, 60%, East and West Coast, nominally 1s.; crystals, 30-40%, 4d. Crude tar, London, 42s. to 43s.; Midlands, 37s. to 38s.; North, 36s. to 37s. per ton, ex works. Pitch, 72s. 6d. to 75s.; East Coast, 62s. 6d. to 63s. 6d., f.o.b.; West Coast, 51s. to 53s., f.a.s. Solvent naphtha, naked, London, 90-100%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 90-160%, naked, London, 2s. 1d.; North, 1s. 10d. to 1s. 11d. Crude naphtha, naked, 30%, 8d. to 8½d.; North, 7½d. to 7¾d. Refined naphthaline, £18. to £22.; salts, £6. to £7. Toluol, naked, London, 2s. 1d.; North, 2s. Creosote, naked, London, 5½d. to 5¾d.; North, 5d. to 5½d.; heavy oil, 7½d. to 7¾d. Anthracene, 40-45%, 6d. per unit. Cresylic acid, 95%, 2s. 7d. to 2s. 8d.; 97-99%, 2s. 9d. to 2s. 10d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: Home trade, £19. 10s. per ton; basis 24½%. Nitrate of soda, £21. to £22.

FERTILISER MATERIALS.

LIVERPOOL, THURSDAY.

Nitrate of soda is unchanged in either the tone of the market or in the price of the material, and the quotation on spot for 96% quality is repeated at £20. 2s. 6d. per ton, net cash, f.o.r., prompt delivery. East Indian bone meal for shipment is without alteration, the nearest value of 4½% ammonia and 52% phosphates, July-September shipment, being £12. per ton, net cash, ex ship Liverpool. On spot holders require £14. per ton, net cash, for 4½% and 45% quality. Mineral Phosphates: This material is without alteration, and values are therefore only nominal. Dried blood is quiet, the value being about 25s. per unit of ammonia per ton.

LONDON METAL MARKET.

THURSDAY.

Copper: Standard brands, £89. to £89. 5s., cash; £90. to £90. 5s., three months; electrolytic, £92. to £97. Tin: Standard, £240. to £240. 10s., cash, £238. to £238. 10s. three months; Straits, £240. 10s.; English, £237., f.o.r. Lead: Soft foreign, £22. 15s.; English, £23. 10s. Spelter, £40.; hard, £29. to £30. Antimony, English regulus, 90%, £45. Aluminium, £150. Nickel, £195., delivered, packages extra. Quicksilver, £21. to £21. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 30s. per unit.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

Business generally continues to show steady signs of improvement, and values as a whole are fairly well maintained. Resale parcels of 70% caustic soda are on offer at £18. per ton; 58% alkali at £6. 10s. per ton, and refined bicarbonate of soda, bags, £8. per ton. Bleaching powder steady at £15. on spot for softwood casks, on rails. Chlorates are easy at 1s. 3d. for potash, and 8d. for soda. Bichromates are unchanged at recent rates. Roasted saltcake only in

moderate request at 60s. per ton, carriage paid. Soda crystals, 82s. 6d. per ton, in bags. Recovered rock sulphur easy at £20. per ton, on rails, in bulk. Sulphate of copper remains in the same position as regards export trade, and price nominal at £46. per ton, f.o.b. Liverpool. Phosphate of soda dull at £25. per ton. Commercial hypo. soda, £16. 10s. per ton. Concentrated sodium sulphide, 60-65%, weaker at £22. per ton. White powdered arsenic is rather scarce for spot delivery, and price for best Cornish is firm at £35. per ton. Yellow prussiate of potash is quiet at 1s. 10d. Soda is selling better at 7½d. per lb. Carbonate of potash, 80-82%, £85. per ton. Nitrite of soda again lower at £52. 10s., basis 100%. There is not much demand for lead salts, but quotations are steady. White acetate, £86., and brown £76. per ton, delivered. Nitrate, £58. per ton. Acetic acid and acetate of soda are in better request, and quotations unaltered. Brown acetate of lime in good demand at £10. per ton. Grey, £16. 10s. per ton. Miscible and solvent wood naphtha firm at 10s. 6d. per gallon. Oxalic acid, 1s. 2½d. to 1s. 3d. per lb., delivered.

SWANSEA MARKET REPORT.

THURSDAY.

Tinplate prices are rather unsettled, especially for forward delivery. The quotations for immediate supplies range round 32/6 per box of standard sizes. Tin easier at £238. prompt and £236. three months. Copper a little cheaper and passing more freely at £86. per ton prompt and £88. three months. Lead very firm at £22. 7s. 6d. for foreign. Spelter quiet at £38. 10s. Quicksilver, £18. per bottle. Antimony unchanged; English regulus, 90%, £45. Nichel quiet at £195. per ton, including free delivery London or equal. Aluminium, £150. Linseed oil firm at 122/- per cwt. Turpentine easier at 87/6 per cwt. Pitch dearer and firmly held at 51/-, at ship. Sulphate of copper steady at £45. per ton, for home requirements, and for export £47. 10s. Sulphate of ammonia steady at £19. 10s. for home trade; export prices very irregular. Nitrate of soda quiet and steady at £21. per ton; in smaller lots 22/- per cwt. Palm oil has a better inquiry, and is firmly held at £82. 10/- per ton, for Lagos; softs, £82.; and Benin, £77. 10s. Petroleum very firm at 1/4½ to 1/5½ per gallon, in barrels, for American refined. Oxalic acid, 1/3 per lb. Arsenic in poor request: white powdered, in bags, £35. per ton, f.o.b.

TURPENTINE MARKET REPORT.

Messrs. James Watt and Son, Ltd., of 101, Leadenhall Street, London, E.C. 3, report that the stocks of turpentine on June 28 were: American 22,429 barrels, compared with 9,436 barrels at the corresponding date of 1918; French, 46 barrels (16 barrels); and Spanish, 650 barrels (1,310 barrels). Deliveries during the week ended June 28 were 1,421 barrels, against 696 last year, and since January 1 28,559 barrels, compared with 12,546 barrels in 1918. The price on Saturday last was 90/- per cwt., compared with 116/- at the corresponding date of last year. September-December delivery was quoted at 90/9 per cwt.

LIVERPOOL CHEMICAL MARKET.**THURSDAY.**

Business in the chemical market has been moderately active and shows an improving tendency. More inquiries have been made on export account and the demand from the home trades has been on an increased scale. Bleaching powder has been in moderate request and is £14. 10s. to £15. per ton, free on rail or conveyance, in buyers' packages, and £15. to £17. per ton for export. Chloride of calcium has again been quiet and is £8. to £11. per ton, in casks f.o.r. Caustic soda has been in good request with an improved demand for export and is £24. per ton for 76 per cent.; £22. per ton for 70 to 72 per cent., and £19. per ton for 60 to 62 per cent. Nitrate of soda has been more in request and is £20. 10s. to £21. per ton. Saltcake has been in very fair demand and is £6. 10s. per ton, in casks, f.o.b. Soda crystals have been well inquired for and are £5. per ton in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has again been in fairly active demand. It is £7. 5s. to £10. per ton, according to terms of delivery. Hyposulphite has been quiet and the price has eased. Ordinary is £12. per ton, and crystals are £17. per ton. Ammonia alkali has been in good request and is £6. to £6. 5s. per ton, f.o.r. at works. Borax has been rather freely inquired for. The price has been advanced and is £42. per ton for ordinary and £44. per ton for powdered, in bags. Bichromate of soda has been in fair request and is 8½d. to 9d. per lb., Phosphate of soda has been in somewhat better demand, and is £25. per ton. Sulphide of sodium has been in moderate request and is £20. per ton in casks and £22. per ton, in drums. Chlorate of potash has been in quietly steady demand and is cheaper. It is 1s. per lb. Permanganate of potash has again met with a fair inquiry and is 3s. 6d. per lb.

Sulphate of potash continues very quiet and is £40. per ton. Carbonate of potash has been in fair request and is £85. to £90. per ton for 80 to 85 per cent. Caustic potash has sold rather freely and is £160. per ton for 35° Bé. Nitrate of potash has been more inquired for and is £55. to £58. per ton for refined and £40. per ton for ordinary. Canadian ashes have been very quiet. First quality Montreal are £220. to £225. per ton and second quality, £215. to £220. per ton. Bichromate of potash has been in very fair request and the price has eased. It is 1s. 6d. to 1s. 8d. per lb. Yellow prussiate of potash has sold more readily and is 1s. 10d. to 2s. per lb. Sal ammoniac has been in rather active inquiry and is £80. per ton for lump; £75. per ton, for seconds, and £5. per ton extra for ground. Sulphate of ammonia has been rather more in request. The price to farmers in the United Kingdom is £19. 10s. per ton, delivered free to the nearest wharf or railway station, less 10s. per ton as traders' discount, to September 30. Murate of ammonia has been but little called for, and is £50. to £60. per ton, according to quality. Magnesia has been in moderate demand. Carbonate is £3. 10s. per cwt. and sulphate £10. to £16. per ton, according to grade. Alum has sold rather freely and is £18. per ton for the home trade and £18. 10s. to £19. 10s. per ton for export. Aluminoferric has been neglected and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina has been but little in request and is £13. to £18. per ton according to grade. Sulphur has been in moderate demand, with English flowers still scarce. They are £32. per ton. Roll is £28. per ton, and rock, £22. per ton, in bags f.o.r. Sicilian kinds are:—Flowers, £28. per ton; roll, £22. 10s. per ton and third quality £17 15s. per ton. Cream of tartar has been quieter and the price has eased. It is £11 5s. per cwt. Tartaric acid has had a moderate sale and the price is slightly lower. It is 3s. 1d. per lb. Boracic acid has again been in fair demand. It is £72. per ton for crystals, and £74. per ton for powdered. Oxalic acid has had a quietly steady sale and is 1s. 3d. per lb. Citric acid has had a fair inquiry and is 4s. 4d. per lb. White acetate of lead has been

in moderate demand and is £85. to £90. per ton. Arsenic has been more in request, and is £35. per ton for white powdered. Sulphate of copper has been quiet and is £44. to £45. per ton for farmers' uses and £47. to £48 per ton, less 5 per cent.; in casks f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.**TUESDAY.**

Market conditions as far as industrial chemicals are concerned for export. Soda crystals locally are in good request at £5. per ton, 2cwt. bags. Sulphur scarce and firm at £22. to £23. per ton.

The following prices are per ton, net: Bleaching powder, softs and hards, £15. per ton; caustic soda, 74-77%, 23. 5s.; do., 70%, £22.; do., 60%, £20.; recovered sulphur, 2cwt. bags, £23.; hyposulphite of soda, 5-7cwt. casks, £19.; do., 1cwt. kegs, £25.; sulphite of soda, 5-7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75° Tw., £9. 12s. 6d.; do., 100° Tw., £10.; do., 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5.; sulphate of soda (saltcake), in bulk, £3. 10s.; pure white sulphate of alumina, 14-15%, £19. 10s.; blanc fixe, £22.; chloride of barium, £27.; sulphate of sodium, crystals, £18.; do., refined concentrated solid, 60-62%, £25.; hydrate of barium, crystals, £56.

COALS.—Market unsettled. Many collieries, owing to local holidays and peace celebrations, have not yet recommenced work, thus increasing the already acute shortage of coal. Forward the demand is heavy for all classes of coal. Allies' quotations: Best Northumbrian steam, 69s. to 70s. per ton; seconds, 60s. to 65s.; Northumbrian small coals, 45s.; seconds, 40s. to 44s.; best Durham gas coals, 55s. to 57s.; seconds, 52s. 6d.; Durham bunkers, 56s. to 55s.; foundry coke, 49s. 6d. to 50s.; gas coke, 37s. 6d.

WEST OF SCOTLAND CHEMICALS.**GLASGOW, Wednesday.**

Market conditions as far as industrial chemicals are concerned are quite unchanged from the last report, and there are no price variations falling to be recorded. Inquiry is fairly steady, but at times rather slow, and matters may therefore be said to be moving along easy-going lines. Prices current are: Arsenic, £40. per ton, net, Glasgow; bicarbonate of soda, £8. 15s. and £10. per ton for 6-8 casks and 1cwt. kegs, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags, and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £24. per ton, net, Glasgow; chlorate of potash, 1s. 3d. per lb., net, Glasgow; chlorate of soda, 10d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 88%, £11. 5s. per cwt., net, Glasgow; sal ammoniac, £80. and £75. per ton, net, any port, for first and second lump respectively; sal ammoniac crystals £85. per ton, net, Glasgow; saltpetre, £3. 5s. per cwt., net, Glasgow; tartaric acid, 3s. 1d. per lb., 5%, Glasgow.

Likewise there are no changes among the sea oils. Quantities of all oils are very scarce, and among whale oils only two varieties are still on offer—namely, brown (which is still attracting purchasers at 78/-) and black (which is still getting 76/-). Neither pale nor yellow varieties are on offer, and the same comment applies to both pale seal and Menhaden. Newfoundland cod is a fairly steady market at 74/-, its old price, and everything on offer quickly goes into consumption.

In the coal trade conditions continue a little bit easier, and supplies seem to be sufficiently adequate to meet most purposes, both industrial and domestic. Export business continues quiet, and altogether the tone of the market generally may be said to remain more or less unaltered.

- PLUMBAGO**
Bombay, 10 c.
- POTASSIUM BICARBONATE**
Adelaide, 3 c., £17.; Madeira, 2 c., £20.
- POTASSIUM BICHROMATE**
Brussels, 1 ck., £10.; Mauritius, 1 cs. (pt.), £5.
- POTASSIUM BINOXALATE**
Sydney (F.), 2 c., £29.

POTASSIUM CARBONATE—

Cape Town, 1 cs., £9.; Lourenco Marques, 4 c., £24.; Mauritius, 2 c. £9.; Osaka, 11 c., £20.

POTASSIUM CHLORATE—

Bushire, 1 cs., £7.

POTASSIUM CITRATE—

Melbourne, 1 cs., £8.; Perth, 1 cs., £34.; Pt. Elizabeth, 2 cs. (pt.), £8.

POTASSIUM HYDRATE—

Cape Town, 1 cs. (pt.), £18.

POTASSIUM IODIDE—

Bombay, 1 cs. (pt.), £20.; Batoum, 1 cs. (pt.), £35.; Alexandria, 3 cs., £35.; Buenos Ayres, 1 cs., £76.; Cape Town, 1 cs. (pt.), £5.; Durban, 1 cs. (pt.), £35.; Piraeus, 1 cs. (pt.), £16.; Rio de Janeiro, 1 cs. (pt.), £8.; Rotterdam, 4 cs. (pt.), £225.; Singapore, 2 cs., £156.

POTASSIUM METABISULPHITE

Boulogne, 7 pkgs., £45.

POTASSIUM OXALATE—

Perth (F.), 2 kgs., £23.

POTASSIUM PERMANGANATE—

Batoum (F.), 2 cs. (pt.), £20.; Bombay, 9 cs. (pt.), £5.

POTASSIUM PRUSSATE—

Bahia Blanca, 3 cs. (pt.), £13.

POTASSIUM SULPHATE—

Cape Town, 2 pkgs., £25.

POTASSIUM SULPHITE—

Adelaide, 1 c., £7.; Brussels, 2 c., £43.

PRUSSIAN BLUE—

New York, 1 ck., £10.; Paris, 8 cks., £220.

PYROGALLIC ACID—

Brussels, 1 ck. (pt.), £23.

RETORT CARBON—

Calais, 115 t., £650.

SALAMMONIAC—

Athens, 2 c., £12.; Buenos Ayres, 1 t., £77.; Calcutta, 1 c., £7.; Cape Town, 1 ck., £5.; Perth, 5 c., £19.; Singapore, 4 c., £18.

SALICYLIC ACID—

Athens, 1 cs. (pt.), £7.; Bombay, 1 cs., £13.; Brussels, 2 c., £16.; Dieppe (F.), 3 pkgs., £40.; Paris, 10 pkgs., £162.; Singapore, 1 cs. (pt.), £14.

SALICYNE—

Cape Town, 1 cs. (pt.), £6.; Launceston, 1 cs., £10.

SALT—

Antwerp, 12 t.; Aden, 2 t.; Delagoa Bay, 2 t.; East London, 1 t.; Havana, 3 t.

SALTPETRE—

Buenos Ayres, 4 c., £14.; Calcutta, 1 c., £5.; Durban, 1 t. 10 c., £88.; Kilindini, 2 c., £7.; Lisbon, 10 t., £500.; Madras, 4 c., £12.; Rosario, 10 t., £800.; Santander, 20 t., £1,025.; Sydney, 1 t. 10 c., £89.

SHEEP DIP—

Buenos Ayres, 4 t. 9 c., £325.; Philadelphia, 11 t. 1 c., £230.

SILVER NITRATE—

Antwerp, 2 cs., £531.; Mauritius, 4 cs. (pt.), £6.

SILVER PROTEINATE—

Melbourne (F.), 1 cs. (pt.), £11.

SOAP—

Alexandria, 11 c.; Adelaide, 2 c.; Amoy, 1 c.; Amsterdam, 3 t. 13 c.; Antwerp, 303 t. 12 c.; Auckland, 1 t. 17 c.; Barbados, 2 c.; Bangkok, 10 c.; Beira, 4 c.; Bombay, 4 t. 15 c.; Buenos Ayres, 1 c.; Boulogne, 7 c.; Brisbane, 2 c.; Calcutta, 16 c.; Cape Town, 11 c.; Colombo, 6 c.; Copenhagen, 16 c.; Constantinople, 1 t.; Darwin, 1 c.; Dunkirk, 2 t. 10 c.; Durban, 10 c.; Ghent, 16 c.; Hankow, 3 c.; Hobart, 2 c.; Hong Kong, 4 c.; Italy, 5 c.; Karachi, 1 c.; Kilindini, 3 c.; Kobe, 4 c.; Lima, 1 c.; Lisbon, 1 t. 2 c.; Lourenco Marques, 5 c.; Malacca, 1 c.; Madras, 8 c.; Malmo, 4 c.;

SOAP—

Malta, 3 c.; Melbourne, 1 c.; Neves, 1 c.; Madagascar, 1 c.; Melbourne, 15 c.; Monte Video, 6 c.; Penang, 5 c.; Piraeus, 5 t. 2 c.; Pt. Elizabeth, 6 c.; Pt. Moresby, 2 c.; Rangoon, 14 t. 3 c.; Rotterdam, 1 c.; Salonika, 8 c.; Sandakan, 1 c.; Santiago, 2 c.; Santos, 2 c.; Shanghai, 1 t. 16 c.; Suez, 2 c.; Singapore, 5 c.; Stockholm, 5 t. 9 c.; Tientsin, 2 c.; Toronto, 4 c.

SODA CRYSTALS—

Rotterdam, 20 t., £123.

SODIUM BENZOATE—

Athens (F.), 1 cs. (pt.), £7.; Calcutta, 1 cs., £24.; Mauritius, (F.), 1 cs. (pt.), £5.

SODIUM BICARBONATE—

Abo, 1 t., £16.; Antwerp, 1 t., £37.; Cartagena (Col.), 12 c., £14.; Calcutta, 2 t., £85.; Copenhagen, 2 t., £40.; East London, 10 c., £19.; Hango, 1 t., £15.; Rotterdam, 13 t., £130.; Singapore, 4 c., £5.; Stockholm, 1 t., £15.

SODIUM BICHRONATE—

Beyrout, 1 kg., £5.

SODIUM BISULPHITE—

Antwerp, 3 t. 10 c., £102.; Brussels, 4 t. 7 c., £95.; Paris, 3 t. 7 c., £100.

SODIUM BROMIDE—

Batoum (F.), 3 cs. (pt.), £26.

SODIUM CACODYLATE—

Batoum, 1 cs. (pt.), £20.

SODIUM CARBONATE—

Brussels, 3 c., £9.

SODIUM CHLORIDE—

Cape Town, 1 cs. (pt.), £6.

SODIUM CITRATE—

Calcutta, 1 cs., £11.

SODIUM CYANIDE—

Channel Islands, 1 c., £11.

SODIUM DIETHYLBARBITURATE

Batoum, 1 cs. (pt.), £11.

SODIUM GLYCEROPHOSPHATE—

Buenos Ayres, 1 cs. (pt.), £17.; Copenhagen, 1 cs., £63.; Mauritius, 1 cs. (pt.), £7.

SODIUM HYDROSULPHITE—

Antwerp, 4 c., £6.; Raumo, 10 c., £280.

SODIUM HYPO—

Bombay, 1 t. 10 c., £42.; Buenos Ayres, 1 cs. (pt.), £5.; Canton, 1 kg., £10.; Kilindini, 5 c., £8.; Melbourne, 3 t., £134.; Singapore, 1 t., £30.

SODIUM IODIDE—

Buenos Ayres, 1 cs. (pt.), £17.

SODIUM NITRATE—

Copenhagen, 2 cs., £11.; Naples, 2 cks., £52.

SODIUM PHOSPHATE—

Pt. Louis, 10 t., £399.

SODIUM PYROPHOSPHATE—

Auckland, 10 c., £40.; Paris, 11 c., £48.

SODIUM SALICYLATE—

Antwerp, 8 c., £28.; Buenos Ayres, 1 cs. (pt.), £12.; Cape Town, 2 cs. (pt.), £11.; Bombay, 1 cs., £10.; Copenhagen, 2 cs., £88.; Helsingfors, 1 cs. (pt.), £5.; Marseilles, 1 t., £400.; Pt. Elizabeth, 1 c., £15.; Singapore, 1 cs. (pt.), £8.

SODIUM SILICATE—

East London, 10 c., £15.

SODIUM SULPHATE—

Antwerp, 9 t. 15 c., £137.

SODIUM SULPHITE—

Cape Town, 2 c., £8.; Durban, 12 c., £9.; Osaka, 11 c., £34.

SODIUM TARTRATE—

Montreal, 1 c., £8.; Toronto, 15 c., £135.

SULPHUR—

Antwerp, 2 t. 13 c., £105.; Antwerp (F.), 10 c., £30.; Bombay, 1 t. 1 c., £33.; Copenhagen, 2 c., £8.; Paris, 4 c., £5.

SULPHUR (FLOWERS)—

Cape Town, 6 t. 14 c., £188.; Durban (F.), 1 t., £29.; Nantes, 5 t., £178.; Pt. Elizabeth, 2 t. 5 c., £59.; Tamatave, 2 c., £5.

SULPHURIC ACID—

Alexandria, 2 t., £47.; Channel Islands, 18 c., £18.; Shanghai, 3 c., £24.

SUPERPHOSPHATES—

Mauritius, 40 t., £610.

TALLOW—

Boulogne, 10 t. 2 c.; Dunkirk, 9 t.; Genoa, 50 t. 4 c.; Rotterdam, 20 t.

TANNIC ACID—

Rotterdam, 2 cs., £35.; Rosario, 1 cs. (pt.), £20.

TARTARIC ACID—

Calcutta, 1 c. (F.), £16.; Delagoa Bay, 3 c., £68.; East London, 1 c., £23.; Karachi, 15 c., £236.; Mauritius, 4 pkgs. (pt.), £11.; Pt. Elizabeth, 3 c., £60.; Rio de Janeiro, 2 c., £48.; Shanghai, 1 c. (F.), £12.; Singapore, 1 cs. (pt.), £5.; Sydney, 4 c., £75.; Tientsin, 2 cs. (pt.), £6.

THEOBROMINE—

Rosario, 1 cs. (pt.), £74.

TURPENTINE—

Cochin, £16.

URANUM OXIDE—

Gothenburg, 1 kg., £40.

WAX—

Amsterdam, 1 t. 7 c.; Calais, 7 c.

WHITE LEAD—

Antwerp, £460.; Calais, £1,355.; Ostend, £91.; Paris, £2,086.; Pt. Said, £27.; Shanghai, £100.

WOOD TAR—

Lisbon, £400.

XYLOL—

Cape Town, 2 cs., £8.; Paris, 10 drms., £137.

ZINC LEAD—

Antwerp, 10 t.

MANCHESTER.

Week ending June 28.

ACETIC ACID—

Genoa, 1 pkg.

ALUM—

Alexandria, 1 brl.

ALUM (CHROME)—

Antwerp, 5 cks.

AMMONIUM CARBONATE—

Alexandria, 14 brls.; Bordeaux, 10 pkgs.; Rouen, 25 cks.

BARIUM CHLORIDE—

Rouen, 34 cks.

BORAX CRYSTALS—

Alexandria, 6 bgs.

BORIC ACID—

Alexandria, 12 cks.

CAUSTIC SODA—

Alexandria, 39 drms.; Gothenburg, 13 drms.

CHLORIDE OF LIME—

Rotterdam, 16 cks.

COAL PRODUCTS (otherwise undes.)

Genoa, £105.

CRESYLIC ACID—

Philadelphia, 36 pkgs.

DYESTUFFS—

Logwood Extract
Bordeaux, 40 cs.; Genoa, 22 cs.

FERRO-MANGANESE—

Philadelphia, 500 t.

GLUE—

Montreal, 268 bgs.

GLYCERINE—

Alexandria, 22 drms.

MAGNESITE—

Rouen, 100 bgs.

PHOSPHORUS SESQUISULPHIDE

Gothenburg, 60 pkgs.

POTASSIUM BICHRONATE—

Alexandria, 6 cks.

POTASSIUM METASULPHITE

Montreal, 5 cks. **CRYSTALS—**

SALAMMONIAC—

Alexandria, 2 pkgs.

SALT—

Montreal, 12,800 sks.; St. John, N.B., 50 t.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ...	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3080, Central.
Our Manchester Address is Barton House, 66, Deansgate.

NEW ARRANGEMENTS.

The "Chemical Trade Journal" will be published in future a day earlier.

SUBSCRIBERS to whom the Journal is posted direct will therefore receive it each week on Friday.

THE TRADE will in future be able to secure their supplies from our London office, 265, Strand, at 10 a.m. on Fridays.

EDITORIAL NOTICES.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than Wednesday morning.

CURRENT TOPICS.

NATIONALISATION.

THE fact that we are gradually drifting towards what promises to be probably the greatest political fight in history is one which cannot be regarded calmly by industry, if for the moment we exclude labour. Events have come to a head quickly during the past few weeks, and we now see ranged on one side labour, the strong advocates of nationalisation, and on the other, capital as represented by manufacturers and business men, the strong opponents. Apart from any subtle possibilities in the Ways and Communications Bill, the immediate object of the protagonists of nationalisation is the coal mines and the railways, and as the successful conduct of all our industries is intimately bound up with them, it is clear that the position needs to be carefully thought out by the industrialists and not left for the politicians alone to gain their own desired ends on either side. Broadly speaking, industry, especially in the period of severe competition which is ahead, wants cheap coal, power, and cheap transit, and granted these, it matters not in whose hands these two commodities are. Industry, however, must take steps to see that it is not forced into an unfavourable position merely because certain people in the position to wield power with the Government seek to take the opportunity of doing so in order to give expression to theories as regards State control which have no experience to back them up. The unanimous opposition of all classes of traders and manufacturers against nationalisation of the coal mines is not a thing to be set aside lightly, and it is not putting it too highly to say that the more or less enforced experiments in State socialism during the war have enormously strengthened the opposition to interference in any form by the Government in trade. Looked at quite impartially, it cannot be said that industry and the effect upon it played a very important part in the coal inquiry. It is

true that evidence from many industries was heard, and the invariable case put forward was that nationalisation would lead to dearer fuel. The contrary case, on the other hand, is largely the theoretical one that State ownership would do away with profits to shareholders, and consequently the result to the consumer would be cheaper. Would that past experience led us to accept that point of view, as, for the reason already stated that industry desires cheap coal and transit, we should be rabid supporters of State ownership. The same spirit of doubt exists in regard to electricity supply, and one of the leading electric-power engineers of the country has averred that the consumer will have to pay more for electricity under the proposed scheme of super-stations than is the case now. One striking point in regard to the reconstructed electric-power industry is that plant will cost ever so much more than was the case in the existing power-stations, and, in consequence, the standing charges will be correspondingly higher. With these doubts so strongly present in the minds of the business community, which realises better than perhaps is the case in the environment of Westminster how vital cheap raw materials of the kind referred to are, it is urgently to be hoped that this epoch-marking experiment will not be embarked upon merely to give an outlet for testing a political fetish or as a means of avoiding an out-and-out conflict with the political aims of labour. The official habit is a more or less indefinable quantity, but that it exists we have everyday experience, and none of us likes it. We have heard a little of the loose methods adopted in handling the coal situation during the war, and it is the feeling that there is no guarantee that other methods will be adopted in a general change over to nationalisation which has instilled into the one side of industry—what may be called the commercial side—a wholesome dread of any such happening. It is impossible to evade the fact that industrialists and private trading built up the British Empire, and the experience of the past few years does not suggest that a change in the direction indicated would be for the better. However, our one and only concern is that industry shall not be deprived of what is essential to it merely for the sake of political intrigues and party jealousies. There is no place for these in industrial considerations, and the chemical industry no less than others comes within this category.

TRADE RETURNS.

THE exports of British produce and manufactures last month, as regards total value, were closely akin to those in May, the value being £64,562,000., an increase of £19,536,000. compared with the shipments in the corresponding month of last year. The total imports were valued at £122,945,000., or £21,400,000. more than in June, 1918. Exports of chemicals, drugs, dyes, and colours during the month under review show rather an unexpected drop from the encouraging figures of the past few months. Since November last, the value of the exports of chemicals and allied products had gradually recovered from the low war level, until in March they reached £2,200,000., in April £2,731,000., and in May £2,568,000. Last month's shipments, however, have declined to £1,946,698., or actually £41,000. less than in June, 1918. The exports of bleaching powder, sulphate of ammonia, chemical manures (unenumerated), muriate of ammonia, barytes, white lead, zinc oxide, painters' colours and materials (unenumerated), saltpetre, chromate and bichromate of potash, soda ash,

caustic soda, and soda crystals were all greater than a twelvemonth ago, but compared with the month of May most of the items showed declines. The export movement in sulphate of copper, crude and distilled glycerine, sodium bicarbonate, sodium chromate and bichromate, sodium sulphate, soda compounds (other sorts), and chemicals (other sorts) was less brisk than in June of last year. Imports of chemicals, drugs, dyes, and colours have recovered some of the ground lost during recent months. During the period under review these were valued at £1,776,000., against £2,582,000. in the corresponding month of 1918, a decrease of £805,787. April imports of chemicals were valued at £1,365,000., and May £1,550,000. During the first six months of this year the exports of chemical products were valued at £14,328,000., against £11,049,000. in the first half of 1918; and the imports £10,671,000., compared with £18,362,000.

THE POTASH SITUATION.

A NEW Bill to give effect to the provisions of the law passed by the German National Assembly on April 24 last for the regulation of the potash industry has been prepared, and is now under the consideration of the Board for Economy and the Expert Council. Pending the publication of the details, a Berlin correspondent of a German newspaper draws attention to the change in the potash industry.

The correspondent states that the transfer to foreign hands of thirteen completed Alsatian potash shafts and four in course of construction may have serious consequences for the remaining potash mining undertakings on the right bank of the Rhine and the manufacturing industries which are based upon them. In Alsace 20 per cent. salts are produced direct from the mine at approximately the same working expenses as are required in Central Germany for the winning of 8 to 9 per cent. salts. In the meantime, the mere prospect of French offers of potash—so slowly as the Alsatian production can develop to its full extent—is making itself perceptible in neutral and other countries. How is it possible otherwise, it is asked, to explain why foreign countries or their Governments—England, for instance,—which are in need of potash, have not yet definitely accepted the German offers, which are by no means unfavourable? It has further to be taken into consideration in connection with the development of German sales that the Spanish deposits near Barcelona are being worked with American participation, and that the production of potash in the United States has made some progress during the war, so that America is said to possess moderate stocks. Of course, all these substitutes only have their life prolonged under the operation of the absolute world-potash famine, and can only satisfy the enormous American requirements to an unimportant extent.

Two or three days after the publication of the above communication—on June 26, in fact—Emil Sauer, chairman of the Rothenberg Potash Corporation, informed the shareholders that England had now concluded contracts for the supply of German potash at a total cost of nominally £1,500,000., and that telegrams had been received from the United States, according to which American merchants wished to enter into negotiations for deliveries of potash, the first instalment being for a value of nominally £500,000. The chairman also depicted the situation of the industry as being very serious, and said that a complete revolution in prices must take place if the industry is to continue working. As a consequence of the increase in wages and the rise in the cost of materials, coal, etc., the potash industry would have to incur additional expenses of from £4,500,000. to £5,000,000. this year on a total income of about £12,500,000.

A further statement on the potash situation emanates from Paris, and deals with French and German competition. It is reported, for instance, that the Potash Sales Bureau at Mulhouse has offered to supply 20,000 tons of kainite to Rotterdam merchants this year. The latter stipulate that the Sales Bureau must guarantee the delivery of a similar quantity in 1920 and 1921 at fixed prices. If this condition is not accepted, it is said that the Dutch merchants intend to apply to the German Potash Syndicate instead of importing from the French Sales Bureau.

"WORK-BLINDNESS" IN CHEMICAL INDUSTRY.

ITS PREVENTION AND CURE.

(FROM A CORRESPONDENT.)

A FEW weeks ago, at the close of a series of lectures delivered at Newcastle, Dr. J. W. Mellor made what at the time seemed a most remarkable statement. He said that, taken on the whole, a large number of cases of difficulty to which he had been called in as consultant had been solved in the simplest possible manner by methods which were not only known to the persons in difficulty, but had actually been used by them at some time for another purpose. So frequently, in fact, was this the case that Dr. Mellor had classified such instances as examples of what he called "Work-Blindness." Now this state of the senses, although little attention has been drawn to it, is one of the most important factors to be reckoned with in the great age of reconstruction in which we are going to live.

Before proceeding further, let us firmly grasp the meaning of this phrase. "Blindness," to put the cart before the horse, may be defined as want of sight, ignorance, the human eye being deprived of its normal function. "Work" is the daily round, the common task, the every-day carrying out of operations which each one of us, from the highest to the lowest, must perform. Work-blindness is inability to see defects in the course of our daily work; it is inability to see mistakes and methods of improvement.

It is a phenomenon not peculiar to one trade or profession but to all trades and professions. It affects the highest and the lowest, male and female, adult and child. It is not an infectious complaint in the generally accepted sense, but it is remarkable that groups of people in the same sphere of work may, at one and the same time, be as blind as bats while staring at the same obvious defect. I will give two examples that will appeal to chemical manufacturers.

Quite a few years ago a firm of chemical producers decided to manufacture acetanilide. They had a large aluminium still, with a bottom run-off cock, in only intermittent use. They decided that the temperature from their high-pressure steam supply would carry out the reaction, so they charged up the still in accordance with their research process quantities, and proceeded to carry out the manufacture. At the close of the operation, having placed a large pan underneath the bottom cock, they essayed to run off the product. Unfortunately, the acetanilide had solidified in the cockway, and in about four inches of piping between the cock and the still bottom. Oh, yes! It was quite solid, so they commissioned a man to chip out carefully the block with a thin nickel chisel. They warned him to keep his arms from directly beneath the cock, and provided him with rubber gauntlet gloves for safety. At the end of about an hour the blockage was pierced, and the yield poured out. And because the man was very careful and did not get splashed with the molten product everybody apparently was satisfied. Six or seven charges were run through in this way under the supervision of a practical pharmaceutical chemist, who, however, afterwards tried to keep the cockway hot during the operation. But he did not succeed in preventing the blockage, which had to be chipped out before running off the charge.

About this time there were departmental changes, which caused this job to be given to a young and comparatively inexperienced academic chemist, who, after being shown the method of running off the yield, almost collapsed. The whole of the first charge that young man made on his own was run through the cock in one-fifth of the time previously taken to clear the cock that was always blocked.

How did he do it? Well, in the first place he had the cock well lubricated with graphite at the start, so that it would easily turn, and, in the second place, he pushed one limb of a U-shaped piece of $\frac{1}{4}$ in. iron rod, strongly heated, up the open cockway; the other limb of the U-wire, bent at right angles and wrapped with asbestos string, was used with safety as a handle. The solid acetanilide (M.P. 112° C.) by this means had a narrow passage melted through it, and the 3 cwt. charge of molten product up above did the rest.

The trick was obvious to an outsider, but the routine worker had not thought of it. True, he endeavoured to prevent solidification, but failed, and was settling down to the regular operation of chipping out the solid blockage after each batch.

An even better example of chemical work-blindness was instanced by a friend of mine the other day. He had been shown round an old-style English chemical works by the manager. In one shed, used chiefly for filtering and centri-

fuging operations, the floor, a flagged one, was an area of pools and puddles, and in some cases pits of resting water and weak chemical liquor. The process workers, by a species of mental geography, picked out a fairly dry path to their machines, although when running a trolley into the shed this was a work of art. My friend commented on the condition of the floor, and was told that "they could not always be brushing water away."

At the far end of the shed they were just beginning to remake the floor with a concrete surface. They were making a beautifully level floor, just like the bed of a billiard table. But when my friend suggested that it would be much better to have a gentle slope on the floor towards the single-side drain, the manager thought it was a brilliant idea. And yet on visiting the acid plant, quite close by, my friend noticed that the identical principle had been applied to the lead trays on which stood the Glover and Gay-Lussac towers, which all drained down to one side, with an outlet to a common channel. On the other hand, even my friend admitted that he had never thought of applying the same principle to the drip-catching tray of a filter press.

Work-blindness is often the result of too great familiarity with one's job, whereby one is apt to pass over the little details which one day count against us. It is produced by the feeling of satisfaction that everything is going all right, and by our complacent idea that we know all about our job. As Kipling has said in one of his poems:—

"And whatever we do, we shall fold our hands and suck our gums and think well of it.
Yes, we shall be perfectly pleased with our work, and that is the perfectest Hell of it!"

The engine-driver who runs past his signals, the doctor or pharmacist who uses the wrong drug through taking the bottle next to the one he wants, and the foreman who spoils a yield, perhaps through working without a thermometer or relying solely on judgment, are all momentary victims of this dangerous affliction.

I am afraid that work-blindness is of such an insidious nature that even now some of my readers may not realise its existence. However, I will leave them to ponder and reflect. The main purpose of my article is to stimulate and suggest means by which this failing may be counteracted. Not only in the chemical industry, but in every other, methods are, and ought to be, more available for the prevention of the effects of industrial blindness.

Broadly speaking, the line of procedure is to substitute systematic or scientific methods for the old rule-of-thumb arrangements which have been so much the fashion in the past. Useful remedies may be classified under two heads: (1) Human methods; and (2) mechanical methods. Unfortunately, both are liable to defects of themselves. The first because they are human, and the second because most mechanical apparatus may fail at some moment through a simple external cause. Still, we must do what we can. But there is an impression abroad amongst manufacturers that scientific methods are hard to carry out. The reverse is usually the case. In fact, unless a method simplifies a procedure, it should not be regarded as either scientific or useful.

Now the human method must be as easy and simple as possible, or it will not be used. A good deal will depend on the class of worker under consideration. In the case of a brain worker, which I will not define, the matter may be attacked on psychological lines. I would suggest that the first thing a manager must do when in difficulty with a plant or a process or a product is to convince himself that he does not know everything about the job in hand. Then he must approach the difficulty in a fresh and unbiased manner.

First, let him consider and put down on paper, if necessary, all the items that he knows are essential in the operation. After seeing that the essential details are correct and have been observed, let him consider possible defects which may have occurred through physical changes in the product or failure in the work's supply services. Thirdly, let him run over all parts of the work usually left to workmen and subordinates, always mindful of the possibility of tradesmen, who have been doing repairs, etc., on the plant, leaving behind harmful rubbish, or making alterations to cocks, valves, or other parts of the apparatus.

Along the above lines many potential causes of a difficulty may be found, and if, after such an examination, the problem

is unsolved, let him call in the most practical assistant that he employs and listen with an open mind to all the criticism he may hear. Then, if outside help has to be called in, he at any rate will know that he has done his best.

In the case of workmen or juniors such methods of examination and deduction are not usually successful, although on every possible occasion they should be suggested and demonstrated even to the unskilled worker. The two most successful ways of preventing work-blindness in these cases are: (1) To train them to check one another in important operations, and record the check, where possible, in writing; and (2) to insist that they immediately report to a competent person anything abnormal or unusual which may come to their notice. For instance, (a) sudden rise or fall of temperature; (b) cessation of steam, vacuum, gas, or other service supply; (c) unusual physical appearance of materials; (d) analytical results differing in a marked degree from the routine figures found on the tests.

By a strict insistence on the above points many difficulties may be traced to their source, and extension of supervision on these lines will yield fruitful results.

Mechanical methods for the prevention of work-blindness lie chiefly in the use, wherever possible, of self-recording instruments and automatic-warning devices and the systematic tabulation of figures or charts obtained from them. This is a most important point in regard to recording-instruments. Such instruments are often fitted up, used for a short time, and then fall into disuse, perhaps through lack of charts or defects in the instruments themselves. It is therefore desirable to make one person on the works responsible for the fitting and adjustment of all the recording instruments used, and to have all charts, etc., collected and examined by the manager at a fixed hour every day.

Depth-registering instruments on tanks and boilers and vacuum or pressure gauges on mains along which fluids are travelling are examples of useful control devices. Warning bells are of great value, especially if they are loud and distinctive enough, and by means of innumerable electrical arrangements may be made to serve all sorts of purposes, from exposing extremes of temperature and pressure to indicating the correct load weighed into trucks, bins, etc., which are of uniform tare.

It is not, however, my wish to catalogue the numerous devices possible for the elimination of work-blindness: it is rather to suggest that their use should be extended on every occasion, and that a more sympathetic realisation of their value may prevail. By such methods of progress the human factor will be more generally allowed for and checked and counter-checked almost to elimination.

After all, the fact remains that if we can only persuade ourselves that there is still something more to be learned about our own job, and from that basis proceed to search for further and further improvements, we shall certainly discover better and better methods, and in such measure as we progress, without doubt we shall receive our reward.

NEW TYPE OF VESSEL FOR POTASH AND OTHER DETERMINATIONS.

MR. L. J. RILEY, F.I.C., writes:—Ap[ro]pos the more recent methods for potash determination mentioned in a recent issue, mention may be made of the use of porcelain basins with dark-coloured lining in lieu of the less stable and more fragile and costly glass basins hitherto generally employed. Additional advantages possessed by the new type of basin are that the colourless crystals of potassium perchlorate are better seen, thus facilitating washing out, and an experienced operator can gauge approximately the potash content before the determination is completed. Deep green-lined basins of about 3 in. diameter have been found very convenient. The basins should be particularly useful for students.

PERSONAL.—Mr. John Watson, F.I.C., formerly of the Allhusen Works, Gateshead-on-Tyne, and more recently chief assayer of the City and Suburban Mine, Johannesburg, has been appointed chief chemist and works manager of the Indian works of the Magadi Soda Company, Ltd.—Mr. J. A. Johnson has retired from the general managership of the Lostock Gralam works of Messrs. Brunner, Mond and Co., Ltd. Mr. Johnson has held the position for nearly twenty years, and altogether has been forty years with the firm.

SOCIETY OF CHEMICAL INDUSTRY.

ANNUAL MEETING.

THE annual general meeting of the Society of Chemical Industry will be held in London on Tuesday, Wednesday, Thursday, and Friday next, July 15 to 18, under the presidency of Professor Henry Louis, D.Sc. The headquarters during the meeting will be at the Salters' Company Hall, St. Swithin's Lane, E.C. 4. The Chemical Industry Club, 2, Whitehall Court, S.W., has kindly offered temporary membership to members of the society during the meeting. The programme of arrangements, which has already appeared in these columns, is as follows:—

Tuesday, July 15.—10 a.m., Council Meeting; 11 a.m., Annual General Meeting, at the Mansion House. Welcome by the Right Hon. the Lord Mayor of London. Address by the President, Professor Henry Louis, D.Sc. 1 p.m., Luncheon at the Connaught Rooms, Great Queen Street, Kingsway, by invitation of the London Section. 3.30 p.m., Conference at the Mansion House. "Inter-Allied Chemical Federation." Addresses by representatives of the Inter-allied Conference, to be opened by Sir William J. Pope, F.R.S., chairman of the Federal Council for Pure and Applied Chemistry. 8.30—11 p.m., Soirée and Reception at the Imperial College of Science and Technology, South Kensington.

Wednesday, July 16.—10.30 a.m.—1 p.m., and 3 p.m.—5 p.m., Conference at Salters' Hall, St. Swithin's Lane, E.C., "Power Plant in Chemical Works." 10.30 a.m.—1 p.m., and 3 p.m.—5 p.m., Conference at Clothworkers' Hall, Mincing Lane, E.C., "Empire Sugar Production." 7.15 for 7.30 p.m., Annual Dinner at the Savoy Hotel, Strand, W.C.

Thursday, July 17.—10.30 a.m.—1 p.m., and 3 p.m.—5 p.m., Conference at Salters' Hall, St. Swithin's Lane, E.C., "Dyestuffs, Synthetic Drugs, and Associated Products." 10.30 a.m.—1 p.m., Conference at Goldsmiths' Hall, Foster Lane, E.C., "The Chrome Tanning Industry." 3 p.m.—5 p.m., Conference at Goldsmiths' Hall, Foster Lane, E.C., "Recent Developments in the Fermentation Industries." 8.30 p.m.—11 p.m., Reception at British Scientific Products Exhibition, Central Hall, Westminster.

Friday, July 18.—Excursion to Windsor and Taplow. Leave Paddington Station (Great Western Railway) for Windsor. Lunch Windsor. By steam launch to Cookham Lock and Taplow. Tea Cookham. Return Taplow to Paddington.

Among those who have signified their intention of being present are: The Right Hon. Lord Moulton; Colonel Sir Frederick L. Nathan, K.B.E.; Dr. J. C. Cain; Dr. C. C. Carpenter; Mr. A. Chaston Chapman; Dr. E. F. Armstrong; Dr. M. O. Forster, F.R.S.; Professor J. C. Philip; Professor J. W. Hinchley; Professor W. P. Wynne (Professor of Chemistry, Sheffield); Dr. R. S. Morrell; Sir William A. Tilden, F.R.S.; Professor H. Louis; Professor T. Turner (Professor of Metallurgy, Birmingham); Dr. Bernard Dyer; Dr. A. Réé; Sir Richard Gregory; Dr. E. J. Russell, O.B.E., F.R.S. (Director of Rothamsted Experimental Station, Harpenden); Sir William Pope, K.B.E., F.R.S. (Professor of Chemistry, Cambridge); Sir Robert Robertson, K.B.E., F.R.S. (Superintendent of Chemistry, Royal Arsenal, Woolwich); Sir J. J. Dobbie, F.R.S. (Chief Government Chemist); Dr. Herbert Leviinstein; and Professor W. A. Bone.

RAMSAY MEMORIAL FUND.

THE following have consented to act as trustees of the Ramsay Memorial Fellowship Fund: Sir George Beilby, Sir Hugh Bell, Bt., the Right Hon. Lord Glenconner, the Marquis of Crewe, the Right Hon. H. A. L. Fisher, Sir Donald MacAlister, and the Right Hon. Lord Moulton. The trustees will consider in the course of July applications for Fellowships not exceeding three in number. Each Fellowship will be of the value of £250. a year with an expenses grant not exceeding £50., and will be tenable normally for two years, with a possible extension to a third year. The Fellowships are intended for those who have already graduated with honours in chemistry, or taken some equivalent qualification. Candidates who desire their claims to be considered should communicate with the Organising Secretary, Dr. Walter W. Seton, University College, London, W.C. 1. Applications should be received not later than July 14, 1919.

SCIENTIFIC PRODUCTS EXHIBITION.

THE second annual Scientific Products Exhibition promoted by the British Science Guild was opened at the Central Hall, Westminster, London, on Thursday (July 3), and will remain open until August 5.

The origin of the exhibition is now familiar. The war revealed our weakness in many industrial directions, not the least in the chemical industries, and the exhibition has been designed primarily to demonstrate to the general public the manner in which new industries were developed under the compulsion of war conditions, and incidentally to enlist public support in maintaining these new industries, and, secondly, to drive home to the public the manner in which science plays a predominant part in all industrial operations. The exhibitions in London and Manchester last year showed the directions in which we had made ourselves independent of products previously obtained largely from enemy countries, and, carrying this one step further, the second exhibition aims at promoting the development of the industries thus established, and to encourage the foundation of new British manufacturing enterprises depending upon progressive science and invention.

The revolution which many departments of industry have undergone during the war has depended largely for its success upon processes derived from scientific research, and in no branch of national activity has our potential power and productive capacity been more strikingly shown than in the chemical industries. We have recovered lost ground, and need never lose it again if the development of industry through science is made a national aim. There is danger that with the close of the war this will be forgotten, and industry will drift back again into the old grooves, not so much because of the indifference of manufacturers as because of neglect of their interests by the State, or lack of encouragement of home products by the public.

The bearing of politics upon industry, unfortunately, cannot be overlooked. Certain industries which languished in this country before 1914 did not do so through lack of inventive capacity or scientific ability on our part, but for quite other reasons which no amount of science was apparently able to get over. All that the best of our newly applied science has achieved could very well be undone by what happens in the political world as regards the policy adopted after September 1, and it can only be hoped that a happy medium will be struck by which the British manufacturer will not suffer from foreign competition in the manner he formerly did, and, on the other hand, the consumer will not be exploited.

OPENING CEREMONY.

Lord Crewe officially declared the exhibition open in the afternoon of July 3. As the first head of the Department of Scientific and Industrial Research—indeed he was instrumental in bringing it into existence—he naturally devoted his speech to the value and importance of research and the necessity for largely increasing the supply of research workers. The question was, he said, that when a student had finished his scientific training, how was he to be fitted for taking an early part in the various processes of industry. There were different methods of doing this. One, which always appealed to him, was for the student to take definite industrial courses during the vacation. That was commonly adopted in the United States. Another method was for the student to go direct from college to a position as chemist or physicist in a works, and, lastly, there was the system of Industrial Fellowships, which had also been perfected in the States. He hoped now that Peace had come, we were not going to sacrifice the fruits of the skill employed in the recovery of the industries which had been re-established.

Lord Moulton said there were three ways in which Germany had attained the commercial position she had before the war. One was her skill in cornering raw materials. That must be stopped. It would be done partly by our Legislature, but it would be still more the acuteness and resolution of business men that would prevent Germany getting the monopoly of any natural product, and therefore making us dependent upon her. The second cause was that Germany had developed salesmanship to a far greater extent than we had, and in that he thought we might well adopt the sound policy of the Germans, and, finally, there was the specialised attention which the Germans gave to specific objects, in which they were guided by all the scientific knowledge that was at the command of the world. The question which faced us now was how to produce articles of higher quality at reasonable prices which the German had been able to make by means

of the patience and industrial research carried out for so many years. His experience as Director of Explosives Supply had convinced him that we had nothing to fear from any nation. All that we had to fear was from ourselves. The British nation had got the power of research and of invention; it had got the power of patient devotion to a particular end that it had chosen, and it had got the power of acting together on the largest possible scale. All that was necessary was that the nation should be roused to the necessity of doing it, and then, as it had done during the war, it would prove that it could do in all the production demanded by peace what it had done in regard to war production. After a special reference to the rapid strides made in the glass industry, which, he said, was now equal to any in the world, Lord Moulton ended by saying that British manufacturers in the future ought to be ashamed of themselves if they did not continue to make progress in peace at the same relative rate that they had during the war.

"CHEMISTRY IN RECONSTRUCTION."

Lecture by Sir William Tilden.

On Monday Sir William Tilden, F.R.S., delivered the first of the series of lectures which have been arranged during the run of the exhibition, and dealt with chemistry in reconstruction. After mentioning that he had returned to practical laboratory work after a period of ten years' retirement, Sir William said that he interpreted the title of his lecture to mean that he should give not only some words of encouragement but also of warning in respect of the future. He was sure that everyone after visiting the exhibition would go away with a feeling of satisfaction that the British chemist, if he was only given a chance, was able to hold his own not only against the German but against the chemist of any other nationality. The exhibition was strong testimony to the activity, knowledge, skill, and scientific ability of the British chemist. Whilst, however, he felt a considerable amount of gratification and pride in the achievements of his fellow-countrymen, there were one or two facts which must be borne in mind. It might be said that the British chemical manufacturers were now able to meet the situation, to supply the needs of the country with a little over, but it was not much, and that position might be subject to very considerable modification as time went on. Germany had not suffered the violation that she had inflicted upon Belgium and part of France; her factories remained practically as they were before the war. Moreover, the chemists of Germany were very able people who had shown great capacity for organisation and extraordinary skill in applying scientific knowledge to practical purposes. Consequently, with her chemical factories little disturbed by the war, if at all, Germany would prove a serious competitor who would have to be reckoned with when it came to questions of foreign trade.

Then there was Switzerland with a well-established chemical industry and chemical schools, and we had been indebted to Switzerland in recent times for some help on the matter of dyes and other things. The United States, too, during the past few years had been making huge efforts to cultivate the science of chemistry by the provision of bigger and bigger laboratories in connection with universities and technical schools on a very large scale. At one university there was a chemical laboratory with places for 1,500 students. That beat anything in any other part of the world. He did not know how that was going to work because it was difficult to realise that the teaching could be satisfactory under such conditions. However, they liked to do things on the grand scale in America, and there was no doubt that the American chemical industry would prove a formidable competitor. Another country which must not be overlooked was Japan. The Japanese have shown extraordinary activity in the chemical industries, and had established a very respectable chemical school. Moreover, they had some natural products which were available; for instance, camphor, which, while it could be produced synthetically, could not be made in that way at a price which would keep the natural product off the market. Therefore in congratulating ourselves upon our position, we must not overlook the competition we were faced with, at any rate in foreign markets.

A question mentioned by Lord Crewe in opening the exhibition was the best means of training necessary for producing not only chemical teachers but chemists for practical work. He himself contended that a chemist should first of all have a good general education, then he should spend five years in learning the various branches of chemistry before he went into the works. He had put that forward 25 years ago when he was chairman of one of the sections of the British Association,

and had been ridiculed for suggesting such a long period, but he did not recede from that position to-day. The rudiments of chemistry might be learned in two or three years, but it must be remembered that chemistry involved the study of an art as well as the study of the application of the principles of science. They had got to learn to do things as well as talk about them, and that meant long practice in the laboratory. It was quite possible that the period of five years might be shortened appreciably in the near future on account of what was learned at school, because the great public schools now had magnificent chemical laboratories, but he believed that the best course was to send the student straight from college to the shop rather than to put him through a so-called course of chemical engineering which could not give that training in the handling of thousands of gallons of liquids or tons of solids which had to be handled in the works.

After mentioning how chemists in the past had suffered from the ignorance of the public, and complaining of the application of the word "chemist" to a pharmacist, Sir William Tilden dealt with dyes. The mind of the public, he said, had been a little too much occupied with dyes during recent years, owing to the shortage of dyes which existed in the early days of the war. It was now possible to produce synthetically all the vegetable dyes, and although disparaging remarks were made with regard to aniline dyes, it was not the fact that vegetable dyes were superior to aniline dyes. But there were things that were even more important than drugs and dyes. The fundamental materials were acids and alkalis. The amount of sulphuric acid consumed by a country was a measure of its industrial conditions, and sulphuric acid was the key to everything else. Of late years larger and larger amounts of sulphuric acid had been made by the contact process, and, although the old chamber process was not extinguished, it no longer took the premier position; in course of time it might possibly disappear altogether.

The most important recent discovery was the production of ammonia by the combination of hydrogen gas with atmospheric nitrogen. This process was one of extraordinary scientific interest, and practically had become of great commercial importance. It was introduced in Germany by Professor Haber, and a plant was to be erected very shortly in this country for the purpose of carrying it into effect. There were a number of other substances which could be mentioned as likely to play an important part in the future of the chemical industries. Many chemical compounds now of the highest practical importance were, at the beginning of the war, mere chemical curiosities, and in this connection Sir William exhibited a specimen of synthetic rubber, the basis of which was acetone. It was pure rubber, and had been made during the war in considerable quantities by the German firm of Bayers under conditions which did not consider price. He was told that it cost, roughly, 20s. per lb. to make, whereas the selling price of rubber was one-tenth of that; but he was quite certain that within two or three years synthetic rubber would be on the market as a serious rival to natural rubber. It was over 30 years ago that he himself found that by keeping ether in a bottle for a few months at a temperature between 30° and 40° C. it was sufficient to convert it by spontaneous change into rubber. That was the method which had been adopted by the Germans.

His word of warning in regard to chemistry in reconstruction was that we must work hard and see that we raised a new and highly qualified race of young men who would take the leading places in the industry.

Sir Richard Gregory, chairman of the Exhibition Organising Committee, in proposing a vote of thanks to Sir William Tilden for his lecture, said that the United States had now invested something like £50,000,000 in the dye industry, an amount equal to that invested in the seven or eight German dye companies before the war. America before the war only had four or five firms making dyes, but by the beginning of 1917 she was producing all the intermediates she required, and 150 firms were producing anilines. We in this country had to get into a position to compete with that. The United States, one time an importing country, completely dependent on Germany and Switzerland, was now an exporting country, for she had invaded Canada, South America, and even Japan and India, with her dyes.

THE EXHIBITS.

As was the case in 1918, the chemical section of the exhibition is by far the largest, the number of exhibits exceeding 60. In addition, the interest of the chemist is attracted to the metallurgical section in particular, and to some of the

other sections in general. We will, however, deal with the exhibits in the chemical section first. Many exhibits consist of show cases, which it is difficult adequately to describe, as any description must necessarily consist merely of a list of the examples of chemical shown.

The Accrington Brick and Tile Company, of Accrington, Lancashire, are now making the Guttman patent cellular-filling material for absorption towers, which were formerly made in Germany. They are made of Accrington acid-proof brick. Two sizes are exhibited: type B, measuring 6in. by 3in., and type C, measuring 4in. by 2in., in section. The latter is chiefly used for small towers. The point made in cell filling compared with other types of filling material is that in their passage through a cell tower the gases are continuously changing their velocity, thus giving a mixing action which brings fresh particles of gas into contact with the wetted surface. The velocity of the gases in a tower is usually very low, about 30ft. to 50ft. per minute, and if nearly the same cross-section obtains throughout the tower, this is insufficient to cause strong eddies by impact against the surfaces or by mere deflection from them. In cells, the cross-section, when the gases pass through the slots, is reduced to about 15 per cent. of the area of the tower, thus giving the gases a velocity five or six times that obtaining at the widest part of the cell, and producing a good mixing action.

The British Alizarine Company, Limited, Silvertown, London, claim that they are the only makers of dyestuffs of the alizarine series in the United Kingdom. Originally alizarine was derived from the madder-root, but it is now prepared synthetically from anthracene, a coal-tar hydrocarbon. The exhibit includes specimens of crude anthracene, as well as of the purified material, the production of which constitutes the first stage of the alizarine process. The second stage consists of the oxidation of anthracene, producing sublimed anthraquinone, which in turn is treated with fuming sulphuric acid to obtain sulphonie acids, which are exhibited in the form of various sulphonie salts. On fusion with caustic soda, the monosulphonate yields alizarine, the α -disulphonate yields flavopurpurine, and the β -disulphonate yields anthrapurpurine. Specimens of each of these fundamental dyestuffs are exhibited.

Bow Bridge Dyes and Chemical Works, Stratford, London, E. 15, the proprietors of which are British Pharmacy Oils, Limited, have designed their exhibit to give an idea of the progress made more especially since the works were released from war work by the signing of the armistice. Special attention is directed to eosin, made entirely from intermediates produced in the firm's works, and is regarded as an important step in reducing the list of dyestuffs hitherto imported. Another direction in which special attention is being given is the paint, varnish, printing ink, and pigment trades, which have been neglected somewhat in comparison with the attention paid to other branches. The firm intend specially to cater for these trades, and are introducing a large number of suitable pigments. An interesting feature is the practical demonstration with a hank-dyeing machine, of the dyeing of hank with dyes obtainable hitherto only from German sources, but now made at Stratford.

Guthrie and Co., of Accrington, manufacturers of "Ceratherm" acid and flame-proof earthenware, show some specimens of heavy chemical plant made of this material. No metal of any kind is used in the essential portions of the armoured centrifugal pumps, so that the liquids which are dealt with are in no way contaminated. They are in satisfactory use on boiling hydrochloric acid, nitric acid, sodium peroxide solutions, etc., where other forms of pumps would at any rate give trouble. Exhausters for condensing hot acid gases are also exhibited made of this material.

"Ironac" has already made a name for itself in the chemical industries as an effective acid-resisting iron for sulphuric and nitric acids, and specimens of vessels, pipes, pumps, valves, and other castings demonstrate its wide application on the stand of Haughton's Patent Metallic Packing Company, Limited, 30, St. Mary-at-Hill, London, E.C. 3. Parts of plant and equipment are also shown. Acid-resisting iron is peculiarly a British industry, and great progress has been made with Ironac metal during the period of the war.

As would be expected, British Dyestuffs Corporation, Limited, which incorporates Levinstein, Limited, of Manchester, and British Dyes, Limited, of Huddersfield, have an imposing exhibit, aimed at demonstrating primarily the manifold applications of coal-tar dyes. These are shown in their relation to the dyeing and colouring of leather, paper, paints,

distempers, soaps, fats, wax, oils and varnishes, boot polishes, writing, copying and printing inks, etc. The various stages necessary for the production of the finished coal-tar colour from the crude distillate obtained from the coal-tar resulting from the destructive distillation of coal are set out in an informative manner, and the whole exhibit bears testimony to the progress which has been made in the coal-tar colour industry in this country since the stoppage of the Continental supplies. Special sections are devoted to synthetic indigo (Indigo LL) and its derivatives and to other colours of exceptional fastness. A particular feature is a collection of samples of all the colours requisite for the production of a single direct cotton colour. The large number required serves a useful purpose in instructing the uninitiated in the many processes involved in the production of what the trade terms a "common black."

Close by and of allied interest is the stand of the South Metropolitan Gas Company, a striking reminder of the relationship between the gas and chemical industries. The products shown are in two groups—viz., (1) those manufactured before the war and still made, (2) those manufactured since the declaration of war. Among the latter may be specified desulphurised motor spirit, benzene, toluene, synthetic phenol, purified naphthalene, pure anthracene, anthracene (95-97 per cent.), carbazol, acridine, phenanthrene, and fluorene, to mention the coal-tar products. Among the other products is metro-sulphate, a dry neutral sulphate of ammonia guaranteed to contain 25½ per cent. ammonia. A typical analysis given us is: Ammonia, 25.65 per cent; moisture, 0.03 per cent; free acid, nil. The special characteristics of this material are demonstrated by the operation of the metro-sulphate fountain, which shows the ease with which this material may be distributed on the ground owing to its dry, finely divided nature. Contact sulphuric acid, hydrochloric acid, nitric acid, and oxide of iron, sodium sulphide, and copperas are among the other war products of the gas industry to be seen.

In the same breath may be mentioned a similar exhibit by the Gas, Light, and Coke Company, and there is no need to particularise again, beyond mentioning the special attention given to British-made blues, examples of which are shown in the form of stained papers, artists' colours, printing inks, enamelled leather and paint.

The Thermal Syndicate, Limited, Neptune Bank, Wallsend-on-Tyne, again show their Vitreosil products, which were described on the occasion of the last exhibition. This material is produced by the fusion of pure silica in the electric furnace, resulting in a uniform product absolutely resistant to acids of any strength or temperature. It has now been applied to all forms of chemical plant and apparatus where its special qualities are called for, and is claimed to have entirely replaced Continental porcelain and pottery ware in chemical works and laboratories.

T. and C. Clark and Co., Shakespeare Road, Wolverhampton, show their porcelain enamelled cast-iron vessels, a development in which they were the original patentees and manufacturers. From the largest chemical works apparatus to the smaller details of the laboratory, the material is applicable, as the exhibit well shows.

Catalpo, Limited, of 19-20, Holborn Viaduct, London, E.C. 1, show in a neutral-end product bearing the same name the result of progress in colloidal chemistry in the treatment of a British mineral earth by a "physico-chemical lixiviation and sedimentation process." For dyes and colours, and in paints, printing inks, enamels, etc., it is offered as the only base, absorbing the smallest quantity of dye on the largest quantity of pigment to produce a given shade of colour.

On a stand erected by the Sir John Cass Technical Institute, Jewry Street, Aldgate, E.C. 3, we saw the clip for securing rubber connections with glass and metal tubing designed by Dr. Charles A. Keane and Mr. G. Patchin, and already noticed by us on the occasion of the June meeting of the London Section of the Society of Chemical Industry. On the same stand Dr. H. J. S. Sand exhibits the cadmium vapour arc lamp, which was also described at a meeting last session of the London Section of the Society of Chemical Industry. In principle, it is similar to the well-known mercury lamp, and once started, gives a powerful light, and will burn indefinitely. It is hoped that, in addition to its uses for the purposes of optical measurement, in which lines of definite wave length and great intensity are required, the lamps will find application as a powerful source of red and of ultra-violet light.

An interesting exhibit by Messrs. Thomas Kerfoot and Co., Limited, Bardsley Vale Mills, Bardsley, Lancashire, is the

actual bottle of kerocein shown at the 1918 exhibition. This has been kept sealed since, but fully exposed to light, and it shows no change in appearance. Kerocein is said to be chemically, physiologically and therapeutically identical with the German pre-war product novocain, a most desirable local anæsthetic. Kerocein is manufactured under licence from the Board of Trade, and is tested under arrangements approved by the Board. It is demonstrably purer than the German article, its melting point, for example, averaging nearly a degree higher than the German standard. This firm, in addition to a series of organic compounds, the manufacture of which has been undertaken since 1914, has taken on the manufacture of a considerable variety of the rarer sugars and related compounds which are required in a specially pure condition for bacteriological purposes.

"Vitreon" chemical ware is, as in 1918, shown by Shanks and Co., Limited, Tubal Works, and Victorian Pottery, Barrhead. The claims for it, which have been demonstrated by its extensive use, are that it is a porcelain body with great crushing and tensile strength, good heat-resisting properties, and high dielectric strength. It is extensively used in the Hart condensing plant for nitric acid.

Quite a considerable number of exhibits consists of show cases containing samples of various organic chemical products, pharmaceutical and fine chemicals and intermediates, about which it is difficult to say much unless a list of the samples shown by each firm were given, which is impossible for reasons of space. A brief reference must therefore suffice for these. Allbright and Wilson, Limited, Oldbury, who show phosphorus products, were the first firm in England after the outbreak of war to produce tungsten powder (April, 1915); British Drug Houses, Limited, 22-30, Graham Street, City Road, London, have an exhibit comprising about 100 specimens of fine chemicals of the high degree of purity called for by analytical and research work; W. J. Bush and Co., whose exhibit consists of fine organic chemicals prepared synthetically, were manufacturing them before the war, but immediately increased their facilities, and the firm are satisfied that they are now well equipped to meet any German competition in the future; Clorethers, Limited, 26-28, Mark Lane, London, E.C. 3, have recently started operations on a large scale at Blackburn for the preparation of intermediates for dye manufacture; Hedley and Co., 120, Harrow Road, Leytonstone, state they were the first firm in this country to undertake the preparation on any scale of ethylchloride, many hundreds of tons of which were manufactured yearly in Germany before the war, and were largely used in the manufacture of pharmaceutical products and intermediates for dyes. Special pamphlets have been prepared dealing with the technical application of ethylchloride to the chemical industry and to refrigeration.

Other firms exhibiting who come within the above category are: The Weston Chemical Company, Limited, Liverpool; Spencer, Chapman and Messel, Silvertown, London, E.; Stafford Allen and Sons, Limited, London; Stockton-on-Tees Chemical Works, Limited, Stockton; Pierson, Morrell and Co., Limited, Barnet; London Chemical Works, Limited, Southall; J. W. Leitch and Co., Milsbridge, near Huddersfield; Holt, Thompson and Co., Limited, Liverpool; R. Graesser, Limited, Ruabon; Brunner, Mond and Co., Limited, Northwich, who exhibit synthetic phenol and ammonium nitrate produced from nitric acid made by the catalytic oxidation of ammonia; and A. Boake Roberts and Co., Limited, Stratford.

It is difficult to particularise with regard to the exhibits of laboratory glassware and porcelain goods, so numerous are the articles now made. The story of the development of the British chemical glassware industry has been told more than once during recent years, and need not be recapitulated here. Suffice it to say that no one need now go out of the country for any such apparatus. A notable exhibit is that of the British Chemical Ware Manufacturers' Association, a combination of some eighteen firms, who, in pointing to the sustained effort and heavy expenditure which has been entailed to produce the results shown, call attention to the fact that if the prices of the goods are considerably in excess of the prices which prevailed before the war, examination will show that the increase is less in proportion than the increase in the cost of labour, materials, and fuel. Also exhibiting laboratory glassware are: H. I. Elliot, 20, Cross Street, Hatton Garden, London; the Scientific Supplies Company, Limited, Hatton Garden, London; Hyposol, Limited, High Road, Wealdstone, Harrow; and the British Laboratory Ware Association, 24, Martin's Lane, Cannon Street, London.

BRITISH CHEMICAL TRADE ASSOCIATION.**ANNUAL MEETING.**

THE statutory and first annual general meeting of the British Chemical Trade Association was held recently at the Great Eastern Hotel, London. Mr. William Mann, president, who occupied the chair, said:—

On March 10 the Association was registered with limited liability, and under licence of the Board of Trade permission was obtained to register without the addition of the word "limited." The Association can therefore be said to have commenced its corporate existence on a permanent basis on that date. The conditions of sale and rules of arbitration have been completed and issued in booklet form. These conditions have been widely adopted. Many firms have made it their invariable practice to state on their contracts that they are subject to the conditions of sale and rules of arbitration of the British Chemical Trade Association. Some hundreds of such contracts to my knowledge have been accepted by members as well as by non-members without question, and it is pleasing to record that, notwithstanding the large number of trade disputes which have unfortunately occurred since the armistice, so far as I know not a single arbitration has had to be held under the Association's conditions. There is not the slightest doubt that these conditions have done much to crystallise the position, to furnish acceptable definitions, and to abolish incipient causes of dispute. An Appeal Committee has been formed, and is now ready to deal with any disputes which may be referred to it, but, obviously, since there have been no disputes under our conditions of sale, no occasion has so far arisen for the rules governing appeals to be put into operation.

At the last general meeting I referred to the necessity of the formation of sub-committees, and I made special reference to Manchester. Since then a local sub-committee has been formed in Manchester for dealing with affairs there, and, in view of the great importance of Manchester in the chemical trade, this was, I think, highly desirable.

An Alkali and Allied Products Sub-Committee has also been formed in accordance with the promise made at the last general meeting. In connection with this I would like to refer to the caustic soda question, with which I dealt at some length at the last meeting, when I made special reference to the apparently preferential treatment which seemed then to be in force in regard to licences for these products. As arranged at that meeting, your committee took the matter up with the War Trade Department, and I am glad to record that a considerable measure of success was attained in so far as we succeeded in obtaining an undertaking from the Department concerned to give special consideration to applications for licences from firms who held stocks purchased on the strength or expectation of licences, and which stocks were thrown on their hands by a refusal to renew or sudden suspension of the issue of such licences.

The committee have had under consideration the possibility of effecting arrangements in various places abroad, somewhat on the lines of Lloyd's Agencies, whereby any member, desiring reliable and independent services in any place where he may have no branch office or agency of his own, either for the purpose of inspecting goods before shipment, surveying disputed parcels, or in other ways, may readily obtain such facilities at a reasonable fee through his membership in the Association. This may seem a somewhat ambitious scheme, but it has been evolved in accordance with the wishes of various members who have expressed a desire for such facilities. The matter is now in hand, and we hope to have a more definite announcement to make shortly.

The Association has, I believe, been able to render some considerable service to its members and also to the national interest by the steps taken in connection with the disposal of surplus stocks of chemicals and allied products held by the Ministry of Munitions. The Ministry recognised that the Association, on account of the large number of leading chemical exporters which it represents, was in a special position for finding outlets abroad for materials on hand in excess of what could be conveniently taken up by our home manufacturers, who are, of course, entitled to first consideration. We met them on more than one occasion, and I am pleased to say that our co-operation was welcomed.

Recently we have been called upon to deal with a question of serious concern to importers and consumers. You are aware that the importation of dyes is prohibited except under licence. The attention of the committee was drawn to the

method of licensing which had been adopted, and which necessitated importers and consumers disclosing information as to their business not only to a Government Department but to a trading firm which had been appointed by the Board of Trade to act as their agents in the distribution of imported dyes. Had it been left there, it would have been a sufficiently serious matter for importers that, after receiving their licence from the Licensing Committee, the whole of their business connections should be disclosed to a firm who might at some time become their competitors. But it went beyond that, and, according to information received by the committee, the firm in question had approached manufacturers in the United States, informing them of the position to which they had been appointed, and asking for offers and samples. We took this matter up most energetically with the Dye Commission, and I interviewed Mr. Graham on the matter. A certain measure of satisfaction was obtained, as Mr. Graham gave me an assurance that the firm in question would not be permitted to trade on its own account. We are, however, not content to leave the matter where it is.

I might now conveniently refer to a question upon which there was considerable discussion at the last meeting. I refer to the question of the elimination of any German element of interest in the Association. I want to state the position as it is to-day, and the views of the committee, quite clearly. So far as this Association is concerned, there is no German or pro-German support or interest in any shape or form. I would remind you of the resolution of the committee, which I referred to at the last meeting, and which was confirmed at a subsequent committee meeting: "That no person of alien enemy origin, whether naturalised or not, shall be elected as a member of the Association except by the unanimous vote of the Association Committee." That resolution has been rigidly adhered to, and I can say that when there has been any suspicion at all, the decision of the committee has been unanimously against election. Article 15 of the memorandum and articles of association specifically states that no person shall be a member of the Association Committee unless he is a British subject. Unfortunately, even our Allies are precluded from membership of the Association Committee under this article.

On this question I would like to refer to one of the criticisms which the Association has had to meet. It has often been said that the Association is not fully representative of the chemical trade because this firm or that is not a member, and it has been exceedingly interesting to observe cases in which the firm referred to is either definitely ineligible on account of German nationality or control, or would be unlikely (on account of German interest) to successfully run the gauntlet of the general committee's stringent scrutiny of all applications for membership. Our Association was brought into existence with definite objects, and chief among them is the fostering of British chemical interests: that will be our main policy in the future. We recognise that there are certain products which Germany, by her natural resources or special organisation, and to enable her to carry out her financial obligations under the Treaty of Peace, must be allowed to supply to this country, but our policy must be to foster first of all British production; secondly, that of our Allies; and only to go to our late enemies as a last resource. There is a brilliant future for the chemical trade in this country if the Government, as well as those engaged in the trade, whether as manufacturers, merchants, or consumers, do their duty. When the peace is signed the Government will find themselves compelled to turn their attention immediately to the question of trade policy, and it is for the chemical trade by the closest co-operation to bring all the pressure it can to bear upon the Government to see that the chemical industries in this country do not lose what they have gained during the war.

Mr. Walter Dexter then proposed that in accordance with the president's recommendation Mr. Hugh Hughes (J. H. Dennis and Co.) be elected vice-president. Mr. W. C. Castle seconded the resolution, which was carried.

THE WASTE AND POSSIBILITIES OF COAL.—The Automobile Association and Motor Union, in conjunction with the Gaumont Company, have produced a film entitled "Coal, Its Waste and Possibilities." A private exhibition was given in London recently, and later on the film will be shown throughout the country. The Fuel Department of the Automobile Association is anxious that more benzole shall be produced in this country, and this film demonstrates how, by treating coal scientifically, this may be done without in any way impairing the use of coal for its ordinary purposes.

AMERICAN OFFICERS IN GERMAN CHEMICAL PLANTS.

THIS is the full-page heading given by the *Journal of Industrial and Engineering Chemistry* to a paper entitled "The German Dyestuff Plants and Their War Activities," contributed by Major T. W. Sill, of the U.S. Chemical Warfare Service. It suggests a question: Are there any British officers competent to size up what they see in German chemical plants; and if not, why not? If so, will they be allowed to make public what they see through the columns of the *Chemical Trade Journal and Chemical Engineer*? Major Sill states that in February last, as a member of an Inter-Allied Commission, he had the opportunity of visiting most of the principal plants in the various occupied areas of Germany which were devoted to the manufacture of dyestuffs, medicinal products, and standard chemicals. He is frank enough to admit that he was prepared to find them in a disordered state through lack of operating personnel. He was wrong. To-day one finds these great German plants in splendid condition, with a large, highly-trained force of employees, and, moreover, with additional opportunities for increasing their production by utilising the extra equipment added for war materials production. Owing to the efficiency of the German system, all their man-power was registered and so classified that when war broke out they kept a large proportion of their trained workmen within these plants. Consequently, they still have the majority of them ready to take part in a new battle for commercial supremacy. At present the plants are operating at about 10 per cent. of their production capacity for peacetime products; but, nevertheless, they are keeping most of their labour to avoid their becoming mixed up in agitation or possible Bolshevism. With this surplus of labour marking time, one finds the plants in exceptionally good condition. The only apparent handicap is a lack of first-class lubricants, but substitutes have been found. What the gallant major wishes to impress on his compatriots, and what we wish to impress on our readers, is that this important part of Germany's industries is not crippled, but intact and ready to operate, and is consequently a dangerous factor in the struggle for commercial supremacy, and also a potential source of war material production unless properly controlled. At present they lack certain important raw materials which, fortunately, the Allies can control.

The intact condition of the German factories made the greater impression in that the author reached Germany through the devastated regions of France and Belgium. He made a tour of investigation of the works of the Bayer Company at Leverkusen—a city in itself before the war, and considerably expanded during the war,—during which, despite the contrary assertions of its directors, it was widely engaged in making war material, especially poison gas. The author met Dr. Duisberg, who lightly spoke of an early visit to the States to meet old friends. So little does your German, even the German of the Duisberg type, understand how the initial use of that poison gas has killed all hope of friendship till the crime be expiated. The Germans admit defeat, and promise to pay; but the payment will take years, and forgiveness will be as slow as the payment. If Dr. Duisberg and his like would only read the article by F. B. Garvan on "Industrial Germany" in the same *Journal of Industrial and Engineering Chemistry* (June, 1919) we have before us, it might help them to understand the detestation in which the civilised world holds men like the late Hugo Schweitzer, American citizen, German spy and president of the Bayer Company.

Major Sill also visited the works of Meister Lucius and Brüning, at Höchst. These people, who were pioneers in the development of poison gas, have also considerably enlarged their previously large works. The Badische at Ludwigshafen although heavily employed on war material, were able, nevertheless, to make dyestuffs on an appreciable scale during the war, and at present hold large stocks ready to turn loose on the world's markets when permission is granted. Their works at Oppau for the production of ammonia by Haber's process are also within the occupied zone, and the author saw this plant, which, he says, can produce 100,000 tons of ammonia per year. A duplicate plant, of the same estimated output, exists elsewhere outside the occupied zone. It would be difficult to exaggerate Germany's debt to Haber, yet he never attained a higher rank than that of Captain. His country, however, made proper use of him. Had he been born an Englishman, he would certainly have attained a higher rank, but almost as certainly he would not have been properly

utilised until it was nearly too late. They do some things better in Germany.

Our American observer was impressed by the high quality of the lead fittings in German works, by the superior design of their filter-presses as compared with most of those in use in America, and by a clever method of building their water-towers round their stacks, thus utilising waste heat and preventing freezing. On the other hand, he noticed, as Americans abroad always do, that in the matter of conveying equipment America had the advantage. Difference in wages sufficiently accounts for that; but it does not account for the fact, also observed several times on this tour, that some goods seemed to have put on them unnecessary transportation charges; process A carried out at one place, process B at another far up the Rhine, process C at a place near the starting-point, the plant in each case being simple and of much the same type. This does not square with what we know of German chemical industry, and since the final product in one case was certainly, and in the other was probably, war material, we think the arrangements might be justified as a temporary expedient, or the blame, if blame be due, laid at the door of officials in Berlin.

Major Sill says he understands that the Allies occupying the various areas intend to keep a "qualified corps of representatives" to participate in the control of operations of the factories in their area. "They will thus have command over the raw materials utilised and required, the methods of operation, and the export of the materials produced." We hope he is right. He sees the value of the information to be obtained in this way, and wishes his country to participate in the scheme. If some of those keen young Americans come over on this "stunt," they will learn something. Where is our "qualified corps of representatives?" We, too, have plenty of men of the right type, but have the British Government begun to look for them? Do the British Government see their opportunity?

RECONSTRUCTING THE GAS INDUSTRY.

THE deputation from the National Gas Council which waited upon the President of the Board of Trade on Friday of last week ventilated a few of the grievances under which it has suffered during, and as a consequence of, the war; and as there is a close relationship between the gas and the chemical industries, some references may be made to the matter. The deputation was introduced by Mr. D. Milne Watson, president of the National Gas Council and governor of the Gas Light and Coke Company, and he was supported, among others, by Sir Dugald Clerk, F.R.S., president of the Institution of Gas Engineers.

The main point put forward was that the legislative conditions under which the gas industry now works must be remodelled to suit the conditions which the war has placed it in. One feature peculiar to the industry is the sliding-scale of charging, under which, as the price of gas is reduced, so the dividends paid may be increased; or, conversely, as the price is increased, the dividends paid must be reduced. The precise basis—viz., a rise or fall of half-a-crown in the dividends for every penny rise or fall in the price of gas—was admittedly a fair one in the conditions which then prevailed. The conditions of the war, however, have compelled the companies to be continually increasing the price of gas, with the results that the dividends have simultaneously fallen. Quite apart, therefore, from the hardship inflicted upon the investor at a time when most other industries obviously made larger profits, the effect upon the gas industry of war conditions has been to render it impossible to raise new capital upon anything like reasonable terms, whilst, at the same time, Government loans are offered at 5 per cent. It is true that under the Temporary Increase of Price Act, passed in 1917, a small dividend has been preserved to the companies who have been mostly hardly hit, but it is now felt in the industry generally that if it is to be maintained upon an economic and commercial basis, the whole financial position must be reconsidered and readjusted in the light of the altered conditions which the cessation of the war has brought about. As an additional argument, the dependence of the chemical industries of the country upon the gas industry for many products was quoted in conjunction with the necessity for maintaining the position of the chemical industries which has been attained during the past five years.

The desire is that the Government should introduce legislation practically bringing the conditions under which the gas industry works up to date. The reply of the President of the Board of Trade was, in the reporter's usual phrase,

sympathetic; whilst admitting that he was not an expert in the carbonisation of coal—it had been urged that all coal should be carbonised in order to obtain the by-products needed by the chemical industries,—he knew enough of physics to take a very great interest in it, and, he added, there was no doubt that the future of the country depended to a larger extent than the public realised, both in peace and in war, upon the fuller utilisation of the by-products obtained through the carbonisation of coal, which were in themselves the basis of so many important industries. He assured the deputation that in approaching the Government at this stage they spoke to ears which understood and which were sympathetic. On the financial side, he recognised fully that steps must be taken in some direction which would make it possible for the industry to carry on and develop.

What the industry desires on the technical side is that the recommendations recently laid down in the report of the Fuel Research Board should be given legislative effect to. The main recommendation of that report was that gas should be made of certain calorific values according to the use to which it was to be put. In that way a comparatively low-grade gas could be made and improved to suit the particular needs, whereas at present a 500 British thermal unit standard is laid down. The feeling is that the industry is deprived of freedom in its scientific and technical development by out-of-date legislation. The facts were put forward in an undoubtedly restrained manner, and it is to be hoped that, in spite of the amount of legislation which the Government have to handle just now, time will be found to deal with this particular problem, because its solution is fundamental to so many other necessary developments.

PARLIAMENTARY NEWS.

Sale of Calcium Nitrate Factory.

In the House of Commons, Mr. Rose asked the Parliamentary Secretary to the Ministry of Munitions whether His Majesty's explosive factory, Victoria Works, Wincham, Cheshire, has been disposed of; to whom and upon what terms; and by what amount the cost of erection and equipment exceeded the original estimate?

Mr. Kellaway: After full advertisement, the major part of the property referred to has been sold to the Salt Union, Ltd., the original owners, for £60,000., this being the highest offer received. The factory was erected for the production of calcium nitrate. There was a very acute shortage of this material, which was essential for explosives. Over 100,000 tons was produced at the works. Prior to their erection we were dependent on the limited supply obtainable from Norway, which only provided one-sixth of our requirements. The total expenditure was £334,000., of which £117,000. was spent on buildings. This expenditure was useful only for war purposes, and exceeded the original estimate by £154,000. The actual work done represented a great deal more than was included in the original estimate.

Cellulose Acetate.

Lieutenant-Colonel Thorne asked (1) the Secretary of State for War the names of the firms referred to on page 5 of the Fifth Report of the Select Committee on National Expenditure who were invited to tender in July, 1915, for supplies of cellulose acetate, and what was the reason for refusing to send a tender form to the Cellon Company, of London, and who was the person responsible, and his name, who thus refused permission to an English company, and invited tenders from a firm of neutrals adjacent to enemy territory, the Cellonit Gesellschaft Dreyfus, of Basle, who were advertising their wares in the enemy press; and was the Department aware of this firm's advertisements in the *Chemiker Zeitung* when they invited them to tender; and (2) the Parliamentary Secretary to the Ministry of Munitions the reason why in March, 1918, his Department made an Order forbidding the exportation of cellulose acetate as indicated in the Fifth Report of the Select Committee on National Expenditure, in view of the fact that all that which was being produced in this country was pronounced to be defective; will he state the names of the contractors who carried out the erection and extension of the British Cellulose Company's work at Spondon, Derby; and whether this was a contract between the Ministry of Munitions and the builders or the British Cellulose Company and the builders?

Mr. Kellaway: I will reply to these questions at the same time. A Committee appointed by the Government is examining this question, and, as was stated by the Leader of the

House on July 1, it is hoped that their report will be ready by the end of the month. In these circumstances, I do not think it would be desirable to make any statement at present.

Private Wagons.

Mr. Sugden asked the President of the Board of Trade if he will at once return private wagons to their owners which now, in the majority of cases, are being used by the Government until they become in disrepair, when they are returned to the owners without such owners having the right of recovery of cost of such repair; and will he cause such cost of repair to be paid to the owners and compensation paid to them for loss of trade resulting therefrom?

Mr. Bridgeman: I am afraid I do not clearly understand to what wagons my hon. friend refers, or by whom they are being used. If, however, he will give me further particulars, I will look into the matter at once.

Oil Seeds and Nuts.

Captain R. Terrell asked whether all restrictions likely to check the free importation of oil seeds and nuts will be removed and every facility given to increase production?

The Minister of Food (Mr. Roberts): I am doing everything in my power to encourage the importation of seeds and kernels into this country, and I know of no restrictions likely to check the supply.

Sickness Rates in the Chemical Industries.

Mr. J. Davison asked the Minister of Health whether he is able to submit statistics for the United Kingdom showing separately the sickness rates obtaining in the great organic industries, such as agriculture, chemical trades (including gas-workers), mining, metal trades, and miscellaneous trades, for the years 1913-18?

Major Astor: My right hon. friend regrets to say that statistics do not exist at present in this country as to the sickness rates prevailing in the several organised industries. In so far as information exists at all on sickness rates, as, for instance, in the records of friendly societies and of approved societies under National Health Insurance, it does not afford any guidance as to the rates prevailing in the several industries, because those bodies are not organised according to occupation.

Royalties on Oil.

Mr. Holmes asked on Tuesday whether the Government had come to a decision concerning the payment of royalties on the oil discovered in Derbyshire?

Mr. Kellaway said the Government had this matter under consideration, and an announcement of their decision would be made as soon as possible.

Linseed Oil for Germany.

Captain Brown asked the President of the Board of Trade if his attention has been called to the allegation that, while Belgium is short of linseed oil and is paying £120. per ton for this article, the British Government are selling the same article to Germany at £75. per ton, thus giving preferential treatment?

Mr. McCurdy: In accordance with arrangements made at the Brussels Conference, 25,000 tons of linseed oil were sold to Germany at £78. per ton. When this price was fixed linseed oil could be purchased in the United Kingdom at £58. per ton, and Belgium had declined to purchase any part of the British surplus.

GAZETTE NEWS.

Gravesend Smelting and Refining Company, Ltd., London, E.C.—Resolved June 17: That the company be wound up. W. R. Wildridge, of Moore, Stephens and Co., 2, Gresham Buildings, Guildhall, E.C., chartered accountant, liquidator. Meeting of creditors July 2.

Kirk Chemical Company, Ltd.—Claims to R. Miller, 42, Spring Gardens, Manchester, chartered accountant, liquidator, by July 25.

Synthetic Coal Syndicate, Ltd.—Petition presented, June 6, by Vickery, Hunt and Co., Russell Road, Bowes Park, general engineers. Hearing, Royal Courts of Justice, Strand, July 8. Russell and Arnholz, 3, Great Winchester Street, E.C., solicitors.

Wohle Mineral Oil Products (1910), Ltd.—Meeting of creditors E. Hard's, 17, Fenchurch Street, E.C., July 9.

Yorkshire Vulcanising Company, Ltd.—By order of Court, dated April 30, C. H. Baker, 1, Abnon Street, Leeds, accountant, has been appointed liquidator in place of W. A. Judge, who was desirous of retiring, and retired accordingly.

ITEMS OF INTEREST.

FRENCH PURCHASE OF IRISH BOG.—A French syndicate have acquired a large tract of bog at Ballycumber, Athlone, for the purpose of making peat fuel. An elaborate plant for the manufacture is being laid down.

PATENTS IN ENEMY COUNTRIES.—The Board of Trade have issued a general licence authorising the payment of fees in respect of the grant and renewal of patents and of the registration of trade marks and designs in enemy countries or on behalf of enemies.

ACCIDENT AT CHEMICAL WORKS.—James Morgan (40) was admitted to Ancoats Hospital in a serious condition on Wednesday, suffering from burns to his head and arms, caused by the firing of the contents of a tar still at the chemical works of Messrs. Hardman and Holden, Ltd., Bradford, Manchester.

HARDSTOFT OIL WELL.—The Hardstoft oil well near Chesterfield showed renewed activity on Tuesday. Drilling is being continued through the limestone rock, and the oil surging up the borehole gushed out with considerable force. It is being stored in tanks, the erection of the large storage receptacle not having yet been completed.

PERSONAL.—Dr. G. G. Henderson has been appointed Regius Professor of Chemistry in the University of Glasgow in the room of the late Professor John Ferguson. Dr. Henderson has been Professor of Chemistry at the Technical College, Glasgow, since 1892. He is a past president of the Society of Chemical Industry and of Section B of the British Association.

NATIONAL FACTORIES FOR SALE.—The Disposal Board of the Ministry of Munitions are offering several National Factories, all well-equipped, in various parts of the country. Each of the factories will be sold by private treaty, in one lot, on application to the Controller, Land and Factories Section, Disposal Board, Charing Cross Buildings, Embankment, W.C. 2.

AMERICAN CYANAMID COMPANY.—Messrs. Sperling and Co. announce that operations at the plants at Niagara Falls and Warners, N.J., were on the basis of full capacity during May, but on May 3 the operations at the phosphate mines at Brewster, Fla., were suspended on account of a strike, which, however, is not peculiar to the company's plant, but general over the whole district. Early resumption of work is expected. The net value of the shipments of the various products for May totalled \$357,681., and sales represent a value of approximately \$344,000. Unfilled contracts as at May 31 represent a sales value in excess of \$835,000.

OBITUARY.—The death took place last week, at Birmingham, three days following the death of his wife, of Professor Adrian J. Brown, who since 1899 had been Professor of Biology and Chemistry of Fermentation at the University of Birmingham and Director of the School of Brewing. He was a M.Sc. and a Fellow of the Royal Society, and was the first to occupy the position of Professor of Brewing, to which he was appointed in 1899, and during two decades he was head of the department. At one time he was examiner in biological chemistry at the Institute of Chemistry.—We regret to announce the death of Mr. Holbrook Gaskell, which took place last week at Frodsham, Cheshire, after an illness of several months, at the age of 72. Mr. Gaskell was very well known in connection with the heavy chemical industries, and until recently was a director of the United Alkali Company, Ltd., Liverpool.

FUNERAL OF SIR JOHN BRUNNER.—The funeral of Sir John Brunner, Bart., Silverlands, Chertsey, took place at Lyne, near Chertsey, on Friday afternoon, July 4. The chief mourners were Sir John and Lady Brunner, Mr. Felix Brunner (grandson), Miss Joyce Brunner (granddaughter), Mr. and Mrs. Roscoe Brunner (son and daughter-in-law), Miss Shelagh Brunner (granddaughter), Mrs. Buckley (eldest daughter), Captain Buckley (grandson), Mrs. Parker Lowe (daughter), Captain and Mrs. Arthur Dillon (son-in-law and daughter), Major and Mrs. Guy Gold (son-in-law and daughter), the Hon. Mrs. Blythe (youngest daughter), Captain L. B. Brunner and Mrs. Stanley Brunner, Mr. Oswald Nettlefold, Dr. and Mrs. E. J. White, Mr. Ronald Wyman, the Right Hon. Sir Alfred Mond, Bart., M.P., Mr. Emile Mond, Mr. Robert Mond, Mr. Robert Mathias, Sir Robert Hudson, G.B.E. Representatives of the staffs from the various works of Messrs. Brunner, Mond and Co., Ltd., and of other organisations in the chemical industry, were among the large number of people present.

MALAY TIN EXPORTS.—An official cablegram from Kuala Lumpur states that 2,873 tons of tin were exported from the Federated Malay States in June, as compared with 3,404 tons in May and 2,950 tons in the corresponding month last year. The total export for six months of the present year was 18,389 tons, against 18,538 tons in 1918 and 19,752 tons in 1917.

COMBINATION IN THE GLASS INDUSTRY.—The British Glass Industries Company have acquired the whole of the shares of the Queensborough Glass Bottle Works, and also the business of Payne Bros., trading as the British and Foreign Bottle Company, the latter being one of the biggest dealers and factors in glassware in the country. The total purchase price is in the neighbourhood of £400,000.

A NEW SOURCE OF EDIBLE OIL.—A long-neglected material is the cohune nut, of which manaca palms in Honduras produce a yearly average of 300 pounds per tree. This was brought into temporary demand as a source of carbon for gas-masks, and U.S. Consul C. N. Willard notes that the utilisation is being made permanent and greater as a result of the discovery that the oil is equal or superior to coconut oil for cooking purposes. It is estimated that a single area of the trees, extending 60 or 70 miles along the Aguan River, with a width of 10 or 12 miles, could supply 10,000 tons of nuts a month.

ACID-PROOF ALLOYS.—With the aid of a suitable source of high temperature, especially the electric furnace, C. Rossi, of Legano, Italy, claims to produce substantially pure acid-proof alloys of iron with 13 to 21 per cent. of silicon. A mixture of pig iron and ferrosilicon may be melted with a small amount of iron sulphide or other flux, the impurities being allowed to crystallise out of the molten mass; or iron or steel scrap may be melted with ferrosilicon, with the addition of iron oxide to remove the carbon. The alloys are designed for resistant vessels in chemical manufacture and for anodes in electrolytic processes.

BUSINESS NOTICES.—Owing to the death of Sir Boverton Redwood, Bart., Mr. Arthur Eastlake and Mr. William Sutton, who have been associated with him for the past 28 and 23 years respectively, have arranged to enter into partnership for continuing inspection and advice on all matters in connection with the petroleum industry in a similar manner to that undertaken by Sir Boverton. Mr. Robert Redwood has consented to co-operate with them, to give them the benefit of his experience, and to undertake the examination of oil samples, etc. They will also be assisted by Mr. W. H. Dalton in geological matters, and by other gentlemen previously associated with the late Sir Boverton Redwood.—Viscount Drumlanrig and Mr. F. E. Holland have been elected directors of Messrs. Allen, Harding and Co., Limited, chemical manufacturers and merchants, 1, Leadenhall Street, London, E.C. 3.—Solway Dyes Company, Carlisle, has been incorporated as a private company under the name of Scottish Dyes, Limited. Additional works on a large scale are being erected at Grangemouth, but until these are completed all communications should be addressed to Scottish Dyes, Limited, Murrel Hill Works, Carlisle.

STORAGE OF EXPLOSIVES AT WOOLWICH ARSENAL.—The committee appointed by the Minister of Munitions in July last year to inquire into the Royal Ordnance Factories, Woolwich, made several reports, which are now issued altogether. One of them, which the committee regarded as urgent, states that there are at the present time (November, 1918), in addition to the large amount being handled in the filling houses, over 10,000 tons of explosives stored in the Woolwich Arsenal enclosure. This is contained in 254 magazines and store houses, concentrated in an area of 1,284 acres. Even the disastrous explosions which have occurred at Silvertown, Morecambe, and Chilwell, with their far-reaching effects, could hardly be compared with what might happen at Woolwich. The committee say that the risk taken is to a large extent unnecessary from the military point of view, and entirely unjustifiable in the interest of the public safety. Naval and military authorities agreed in their evidence that Woolwich might well be abandoned so far as the storage of filled ammunition is concerned. Of the 172 buildings, each containing over a ton of explosive, only 15 comply with the regulations of the Home Office governing the distance which should be preserved between magazines and other danger buildings, and between them and private dwellings. In their main report the committee give reasons why Woolwich should be retained as a Government arsenal in peace time, and indicate the methods by which it should be developed and controlled.

CORRESPONDENCE.

*** We do not hold ourselves responsible for the opinions expressed by our correspondents.*

Standard Chemical Stoneware.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—In your issue of April 13, 1918, Mr. Percy Kingsbury, of the General Ceramic Company, U.S.A., writes:—"We have already made some efforts in this direction in the United States—viz., the standardisation of chemical stoneware. The results of these have been very satisfactory." He proceeds to state that, in view of the close relationship which must inevitably arise between Great Britain and the United States after the war, it would be very desirable to make the standards international.

The standardisation movement seems to be speeding up in the United States, as again Mr. Kingsbury writes in *Metalurgical and Chemical Engineering*, September 27, 1918, on the chemical stoneware industry and the war, and remarks on the "phenomenal expansion" of the American industry, and how the United States manufacturers now have nothing to learn from Europe, etc., etc. He uses the same arguments and remarks advocating standardisation of shapes and a proper stoneware body as we did long ago in this journal, almost word for word; well, we forgive him. If it was done independently, it is only one more proof that we are right.

He pityingly refers to the efforts being made here in England, and how the standardisation of chemical stoneware does not seem to make much headway—presumably through lack of encouragement.

We sincerely wish that we could contradict him, but we cannot. In spite of the hard propaganda work we and others have carried out, including a paper read before the Ceramic Society of Great Britain early this year, where the chemical stoneware manufacturers were presented with a basis for carrying on the work, we find within the last week or so that a prominent chemical stoneware firm advertises and illustrates stop cocks and other plant, seemingly designed by a real artist, but without consulting any user or engineer. Tables giving overall dimensions for various sizes are also provided. The dimensions differ as far as it is possible from our suggested standards on engineering lines.

It would be highly interesting, therefore, to learn why they do so—that is, what is wrong with our standards. Through the medium of this journal we made a gift of these to everybody—without a fee,—and a thing given free is never much valued.

Perhaps the stoneware manufacturers have really arranged other standards, or the advertiser expects that all competing manufacturers as well as all users will adopt such empirical sizes as he gives, or is he indifferent to union and progress?

In the absence of any explanation, it seems that after eight months of propaganda work the British potter is in precisely the same position as before—each of the potteries following their own "ideas," no co-operation, no serious attempt to standardise: the result being the old muddle, with no possibility of quick replacements or exchange, etc. Meanwhile the huge market which could have been captured by the British potters, if an effort had been made in time, is now slipping away to other hands and other lands. Indeed, it is not difficult to imagine that a part of the trade will go across to the pushful West, and the rest to the east of the Rhine, where things are organised, and the advantages to maker and user of collaboration and standardisation in things scientific are better understood and appreciated or insisted upon.—Yours, etc.,

HARALD NIELSEN.
JAMES R. GARROW.

Westminster, July 7, 1919.

Ramsay Memorial Fund.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—May we, through your columns, invite the attention of all who are interested in the promotion of an intellectual entente between France and Great Britain to the appeal which is being issued to-day in France by the French branch of the Ramsay Memorial Fund?

The French branch of the Ramsay Memorial Fund, under the presidency of Mr. Lloyd George, are asking for contributions to a fund of one million francs for the purpose of founding Ramsay Memorial Fellowships in Chemical Science, similar to those to be founded in this country, such French Fellowships to be available for bringing to this country for

purposes of research chemists trained in the universities and technical colleges of France.

The appeal in France is being directed specially to British and American residents in France, and to the large number of persons of all nationalities who have for many months past been enjoying the hospitality of France during their duties in connection with the Peace Conference. It is hoped that many will wish to take this opportunity of signifying publicly their admiration and affection for France, and their esteem for the remarkable scientific achievements of France during the war.

Any subscribers in this country who wish to associate themselves with this branch of the Ramsay Memorial Fund can send their subscriptions to the Hon. Treasurer, Lord Glenconner, at University College, London, indicating their wish that the subscriptions should be earmarked for this purpose.—Yours, etc.,

GLENCONNER,
BURNHAM.
H. A. L. FISHER.
H. H. ASQUITH.
HUGH BELL.

Ramsay Memorial, University College, July 4.

Sulphuric Acid Association.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—We now have a National Sulphuric Acid Association, which includes all large and small makers, with the result that all practically quote the same, whether the buyer uses one tank a month or one hundred. Also the Association members say it is only by a narrow margin that they have avoided raising the price beyond the late maximum controlled price; yet sulphuric acid in America is available in unlimited quantities at half the price in Great Britain. Why? And how is it done? How are chemical manufacturers who do not produce their own acid going to compete with American exporters with £2. 10s. a ton on the sulphuric acid against them? We think it is time this question was ventilated. We are informed that a works with a siding enjoys an advantage of at least 15s. a ton over a works without a siding on carting costs alone, this being due, no doubt, to the present abnormal carting costs. Yet the works with sidings say they cannot undersell those without sidings. It seems to us that we have more to fear from an acid combine than from Germany. What do other large users (not makers) of sulphuric acid think, and how are they going to compete with America or Germany in the export trade if acid is going to cost twice as much in England? Will it not lead to a lot of new plants being erected, even though the erecting costs are abnormal—and we already have too many plants?—Yours, etc.,

p.p. VICTORS, LTD.,

B. LEVIN, Managing Director.

Manchester, July 7, 1919.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

THE outlook shows no sign of improvement. The dulness of the steel rail trade precludes any expansion of the make of ordinary iron, for the smelting of which the softer coke made in Cumberland can be almost entirely used. Only a boom in the steel rail industry can bring back to the by-product coking industry the activity which it exhibited during the war period from early 1915 until late 1918. At present the 80 by-product ovens are nearly all on slack blast. The greater proportion of them certainly are not producing within two-thirds of their ordinary output, and it is just possible that even this may have to be reduced shortly. The demand on export account of Cumberland coke is negligible, though persistent efforts have been made to market it. On the other hand, the demand for East Coast coke is constant, the Furness district furnaces absorbing 15,000 tons weekly and West Cumberland 8,600 tons. By-product manufacture is on a reduced scale, and the acid plant of one of the chemical works is idle. No difficulty is being experienced in disposing of sulphate of ammonia or benzole, pitch is firm, and creosote is in fair demand.

RESTRICTIONS ON EXPORTS OF CHEMICALS WITHDRAWN.—By an Order in Council, which appeared in the *London Gazette* on Tuesday, chemicals, drugs, and dyestuffs are deleted from the list of prohibited exports.

LEGAL INTELLIGENCE.

Chemical Workers' Wages: Applications to Reduce War Advances.

The question whether wages shall be reduced in certain trades now that the cost of living is stated to be declining occupied the attention of the Court of Arbitration under the presidency of Sir David Harrel at Westminster on Thursday, July 3. It was a new point raised before a tribunal which hitherto has mainly dealt with applications for increases of workmen's pay. While it is an accepted principle that rates of wages should be regulated by fluctuations in food prices, it was argued on behalf of the men that the high cost of commodities had undergone no material change, and in some instances is even more pronounced now than during the war.

Three cases were before the court. The Soap, Salt, and Candle Trades Employers' Federation submitted a claim to reduce the present minimum war advance of 28s. 6d. from August next by a percentage equal to the percentage reduction in the cost of living, as quoted in the *Labour Gazette* for July, 1919, when compared with the figure quoted in the *Gazette* for November, 1918—the date of the last general advance. A counter-claim for 15s. a week advance in wages for those over 18, and 7s. 6d. under that age, with proportionate increases for pieceworkers, and the establishment of a 44 hours working week throughout the industries, was presented on the men's behalf by the Joint Committee of Salt and Chemical Workers and the National Federation of General Workers, who further asked for the consolidation into permanent wages of all increases granted during the war.

The second case concerned a similar claim by employers to reduce wages in the chemical industries throughout the country, which was met by a counter-demand by the men for the conversion of war bonuses into established wages. In the third case, the National Federation of General Workers supported a claim made by workpeople employed in the manufacture of explosives for consolidating all increases of wages granted during the war.

Evidence on both sides was heard in private, and the decision of the court in each case will be given in due course.

Claim Against British Potash Company.

After a hearing which occupied several days, Mr. Pollock, High Court Official Referee, on Monday gave judgment in an action brought by Willcocks and Company, builders, of Wolverhampton, against the British Potash Company, Ltd., to recover £5,606. 3s. for work done in connection with their factory at Oldbury, near Birmingham. The defendants paid £3,500. into Court as sufficient to cover the cost of the work under the contract, but the plaintiffs contended that the circumstances were such that it would be improper to hold them to their original estimate, which had been departed from in spirit and detail partly owing to the time pressure which had been put upon them, and partly to omissions and additions. The work consisted of the erection of vats, a tank, and chimney shaft for the supply of potash under Government contracts.

The Referee, in the result, held that the £3,500. paid into Court by the defendant's company was amply sufficient to cover the plaintiff's claim, including any extras that might be allowed. He therefore gave judgment for the defendants, who would have, he said, to pay the costs up to the time of the payment in. The subsequent costs would have to be paid by the plaintiffs.

Synthetic Coal Syndicate.

The petition of Vickery, Hunt and Company for the compulsory winding-up of the Synthetic Coal Syndicate, Ltd., was again mentioned to Mr. Justice P. O. Lawrence on Tuesday.

Mr. Owen Thompson, K.C., for the petitioners, now stated that all the creditors had been paid, including his clients, and the costs of the petition provided for. He asked that the petition should be dismissed.

His Lordship assented.

Australian Coking and By-Products, Ltd.

In the Chancery Division on Tuesday, before Mr. Justice P. O. Lawrence, capital unrepresented by available assets was the plea in the petition of Australian Coking and By-Products, Ltd., for the confirmation of the court to a reduction of its capital.

Mr. Stamp said the company was formed in 1909 with the object of establishing and working coking ovens in Australia. The company could not find a sale for its coke, and the result was that it lost money—at least, £60,000.

His Lordship confirmed the reduction.

Abbey Chemical Company, Ltd.

Application was made to Mr. Justice Astbury in the Chancery Division on Friday of last week for the appointment of a receiver and manager in a debenture holder's action against the Abbey Chemical Company, Ltd.

His Lordship ordered that the proceedings should stand over for a week, an undertaking being given on behalf of the company not to part with any assets in the meantime.

Bankruptcy Examination.

At the London Bankruptcy Court on Tuesday last, before Mr. Registrar Mellor, the public examination was held of Charles Read, carrying on business at 5, Victoria Street, S.W. 1. The statement of affairs filed by the debtor disclosed gross liabilities amounting to £3,307. 13s. 6d., of which £3,288. 14s. 5d. was expected to rank against the estate for dividend. The assets were estimated to produce £246. 2s. 8d., thus showing a deficiency amounting to £3,042. 11s. 9d.

The debtor stated that he had acted as agent for the sale in the United Kingdom of "Heronite," a wood preservative, but owing to the delay in the delivery of goods, to the restrictions imposed by the Government on the shipment of goods, and to the fact that in September, 1918, he was fined £100. and costs for dealing in goods without a permit, his business fell off.

The examination was ordered to be closed.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development of Intelligence), 73, Basinghall Street, London, E.C., whence further information may be obtained:—

Australia.

A representative of an Australian firm of repute is now in London, and is desirous of making arrangements to secure the agencies of British manufacturers, for Australia, of dyes for leather, woollens, and hat straw. (Reference No. 3.)

A representative of an established Australian firm is now in London, and is desirous of making arrangements to secure the agencies of British manufacturers, for Australia, of whale oil, cod oil, turpentine, and industrial chemicals. (Reference No. 10.)

British India.

A Rangoon firm, claiming to have a close connection with dealers and consumers, wish to secure an agency, either on a consignment or purchase basis, for aniline dyes. (Reference No. 20.)

A Madras firm are open to take up agencies for chemicals. (Reference No. 22.)

A Calcutta firm wishes to secure a sole agency, for India, for lubricating oils and greases, Portland cement, paints, disinfectants, etc. (Reference No. 24.)

A firm in Madras, who claim to have large industrial interests, are desirous of accepting a sole agency, either to buy outright or sell on commission, for aniline dyes. (Reference No. 28.)

British West Indies.

H.M. Trade Commissioner at Port of Spain, Trinidad, reports that a firm, doing a large import and export trade, wish to get into touch with reliable sources of supply in the United Kingdom for artificial fertilisers. (Reference No. 33.)

France.

An agent wishes to act for United Kingdom firms dealing in light chemicals and pharmaceutical products. (Reference No. 71a.)

Canada.

The following inquiry has been received at the Office of the High Commissioner for Canada, 19, Victoria Street, London, S.W. 1. All replies should be sent direct to the foregoing address.

A Montreal firm of wholesale druggists and manufacturing chemists are in the market for every variety of filter paper suitable for pharmaceutical laboratory purposes (sizes from 13 to 15in. in diameter), and would like to receive samples and quotations from United Kingdom makers.

REPORTS OF COMPANIES.

Esperanza Copper and Sulphur Company, Ltd.

For year to December 31 last the output of pyrites was 62,720 tons, being 23,913 tons less than in the previous year. Owing to the lack of shipments, work was carried on at a reduced rate throughout the year. Angostura and Forzosa mines were stopped altogether at the end of October, and Esperanza mine early in January of the present year. Work at Esperanza mine was resumed on June 18, 1919. The ore reserves, as re-estimated at the end of the year, were 886,000 tons. The development work in hand at San Daniel and Nueva Esperanza was concluded early in the year, and, the results being unsatisfactory, it was decided to abandon this part of the property meantime. All work was accordingly ceased, and the plant in use has been lifted for employment elsewhere. Sixty tons of copper precipitate were produced, or 44 tons less than in the previous year; 54,719 tons of pyrites were despatched from the mine to Huelva, being 38,539 tons less than in 1917. The shipments at Huelva were 67,546 tons, being 11,732 tons less than in the previous year. Practically all the markets for pyrites were closed, except that of the United Kingdom, which was under the strictest Government control. In these circumstances the shipments accomplished, although much below the normal quantity, cannot be regarded otherwise than as satisfactory. Profit for year, £4,761., and £17,897. was brought in, making £22,658. Deduct dividend of 5 per cent. paid August 17, 1918, £17,500.; balance, £5,158., which is carried forward. The profits for the year have failed to reach the standard aimed at, principally due to the stoppage of shipments arising out of the armistice, and more than half the profit actually made has been absorbed by income tax. Having regard to all the circumstances, the directors are, nevertheless, satisfied with the result of the year's work, which leaves the company's resources quite unimpaired, after a most trying period. During the year an opportunity arose of acquiring a small copper extraction works at Stockton-on-Tees on favourable terms. These works have since been put in operation. The bulk of the shareholders of New Lynni, Ltd., has been acquired by purchase. The property is situated in Cyprus, and is held on lease from the British Government. A considerable tonnage of low-grade copper ore has been proved, and it is proposed to develop and exploit same to the best advantage as soon as possible.

Pacific Phosphate Company, Ltd.

The report for year 1918 states that the war has seriously affected the company's business in many exceptional ways. Shipments of phosphate from Ocean Island and Nauru to neutral countries have been prohibited, and the British Shipping Controller has been unable to allocate tonnage for shipments to any part of the Empire or to Allied countries. Nauru now ceases to be a German possession, and it has been decided at the Peace Conference that the mandate for this island shall be given to the British Empire. It is not yet possible for the directors to indicate what may be the ultimate effect of this arrangement. There is ample evidence of an ever-increasing demand for phosphate in old and new markets, and as shipping becomes available sales should exceed both in value and quantity the best results achieved by the company.

The output in 1918 was considerably less than in the preceding year. Mainly on this account the profit for the year was smaller than in 1917. In former years, however, the directors placed £50,000. to a war contingency reserve, and as the conditions under which this fund was created are ceasing to exist, they have restored half of it (£25,000.) to profit and loss account. The directors propose a dividend on the ordinary for the half-year ended December 31, 1918, of 7½ per cent (making dividend for the year 10 per cent.); additional remuneration to directors, £2,812.; forward £13,830.

Alianza Company, Ltd.

For year 1918 gross profit was £180,571., from which have to be deducted: Exhaustion of raw material, £46,470.; depreciation of plant, £1,817.; London charges, debenture interest, income-tax, etc., £65,322.; leaving balance of net profit, £363,961. Adding balance brought forward, £135,928., and deducting interim dividend of 20 per cent., £100,000., there remains £399,889. Directors recommend final dividend of 20 per cent., free of tax (making 40 per cent. for year); forward, £299,889. Profit has been taken in profit and loss account on 2,010,799 quintals, of which 1,167,273 quintals

were produced at oficina Alianza, and 843,526 quintals at oficina Bellavista, and unsold stock at 292,943 quintals has been brought in at cost price. Oficina Bellavista was closed on October 5, 1918, and, owing to uncertainty of outlook in the industry, it has not been reopened.

Evans, Sons, Lescher and Webb, Ltd.

An extraordinary general meeting was held at Liverpool on July 3 for the purpose of confirming as a special resolution the resolution passed on June 18, removing the restrictions on the ordinary shares of the company, and also for the purpose of passing an extraordinary resolution authorising an increase in the capital of the company to £750,000 by the issue of an additional £150,000. ordinary shares.

The Chairman (Mr. William P. Evans, J.P.), said that now that the Treasury restriction as to capital issues had been removed, the directors considered it an opportune time to ask for the approval of the shareholders in respect of the new issue, and had originally intended to publish the prospectus at the beginning of the current month. In view of the great importance of the Victory Loan, however, and the special appeal of the Chancellor of the Exchequer that industrial issues should be postponed until the lists had been closed, they had decided to defer the issue of the ordinary shares until the autumn.

The resolutions were carried unanimously.

DIVIDENDS.

VIRGINIA CAROLINA CHEMICAL COMPANY.—Quarterly dividend of 2 per cent. (2dols. per share) on preferred, and 1dol. per share (1 per cent.) on common; also extra dividend of 2dols. per share (2 per cent.) on common.

CHAMPION AND SLEE, LTD.—Dividend of 5 per cent. per annum (6d. per share), less tax, on ordinary for half-year (interim).

REPORT ON SODIUM PICRATE EXPLOSION.

THE report was issued on Wednesday of Major H. Coningham, H.M. Inspector of Explosives, on the circumstances attending an explosion which occurred in May last in a barge moored alongside the jetty of the Scotswood works of Messrs. Sir W. G. Armstrong, Whitworth and Co., Newcastle, when 96 men were injured.

The accident occurred in connection with the removal of sodium picrate sludge from the company's factory at Lemington Point. At this factory, the report states, contents of lyddite shells are boiled out by means of a solution of soda ash. In this process picric acid from the shells combines with soda to form sodium picrate, which is very soluble, and this is taken in barges, and then out to sea. When the barge in question had a certain amount of sludge on board it was taken from the factory to the jetty, where about 20 tons of concrete blocks were taken on board. The sludge was kept under water in the barge.

From the evidence, the report adds, it seems clear that the explosion was due to the fall of heavy concrete blocks containing pebbles and flint stones on to the sodium picrate in the barge. The total quantity which exploded can only have been small in proportion to the sludge in the barge. It was contrary to the company's instructions for the barge to come back to the jetty. After loading picrate the barge should have been towed out to sea, and the contents dumped in deep water. The reason for the departure from the proper procedure was owing to the breakdown of the automatic grab. Owing to the large quantity of water in the barge, the possibility of some picrate getting dry was not sufficiently appreciated. "Otherwise," says Major Coningham, "I do not think anyone would have been so foolish as to drop large blocks of concrete upon it." Steps have been made to revert to the proper procedure, and in no circumstances will barges containing sodium picrate be again allowed to come near the jetty.

SPANISH EXPORT DUTY ON LEAD ORES.—The Board of Trade are in receipt, through the Foreign Office, of a translation of a Spanish Royal Order, dated May 31, by which the export duty of 1 peseta 50cts per 100kilogs. on galena, litharges, and other lead ores (Sec. 5 of the Spanish Export Tariff), and of 1 peseta per 100kilogs. on argentiferous lead (Sec. 6 of the Export Tariff), is further suspended for a period of three months—i.e., until August 31 next.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

The specifications of the following applications are not printed by the Patent Office until the complete specifications have been accepted.

June 30th to July 5th (inclusive).

Feeding Granular or Powdered Material in Measured Quantities Associated Portland Cement Manufacturers; and Baxter, J. G. 16,509.
Purifiers Employed in Gasworks. Beard, G. F. H.; and Dempster, R. and J. 16,363.
Cyanamide. Luchemin, A. 16,359.
Radiation Pyrometers. Foster, C. E. 16,651.
Vulcanising Caoutchouc, etc., and Compounds Thereof. Gaisman, L.; and Rosenbaum, J. L. 16,340.
Oxidation Processes. Green, S. J.; and Langley, A. S. 16,887.
Nitration of Tung or Other Vegetable Oils. Howse, G. H. 16,741.
Oxidation Processes. Langley, A. S. 16,887.
Utilisation of Low-grade Carboniferous Material. Lesley, R. W. 16,817.
Purifying Liquids. Liénart, A. E. 16,383.
Ethylene Dichloride. Marks, E. C. R. (Union Carbide Company) 16,488.
Propylene Dichloride. Marks, E. C. R. (Union Carbide Company) 16,489.
Reduction of Metals to Powder. Mellor, J. P. 16,833.
Recovery of Varnish, etc., from Waste Micanite, etc. Micanite and Insulators Company; and Whalley, H. C. S. de. 16,907.
Cooling or Liquefying Gases, etc. Zich, M. 16,774.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C.

1917.

Safety Tank for the Carriage or Storage of Inflammable Liquids. Tompkin, A.; and Tompkin, A. 11,182. 128,604.
Pressure Furnaces for Use in the Synthesis of Ammonia. Maxted, E. B.; and Smith, T. A. 11,643. 128,623.
Recovery of Volatile Solvents. Bregcat, J. H. 11,994. 128,640.
Application of Varnishes Containing Volatile Solvents. Ward, G. L. 12,342. 128,658.
Dopes or Varnishes. Groves, S. E.; and Ward, T. W. H. 12,349. 128,659.
Destructive Distillation of Carbonaceous Materials. Perkin, F. M.; and Nitrogen Products and Carbide Company 12,350. 128,660.
Electrolytic Production of Zinc, Copper, or Other Metals. Soc. de Metallurgie Electrolytique. 15,629. 128,676.

1918.

Manufacture of Lactic Acid and Its Salts and the Recovery of the Volatile Fatty Acid By-products. Desborough, A. P. H.; Reilly, J.; and Thaysen, A. C. 6,729. 128,687.
Fermentation Products. Desborough, A. P. H.; Reilly, J.; Thaysen, A. C. and Henley, F. R. 10,220. 128,714.
Disazo-dyestuffs. Inray, O. (Soc. of Chemical Industry in Baste) 10,461. 128,726.
Treatment of Waste Liquors. Thompson, W. P. (Underwood, F. E.; and Illston, B. F.) 10,513. 128,730.
Portland Cement. Akerman, W. S. 10,801. 128,750.
Purifying Aluminous Materials. Norton Company 11,378. 118,605.
Aluminous Abrasive. Norton Company. 11,380. 121,721.
Blue Sulphurised Dye. Soc. l'Air Liquide. Soc. Anon. pour l'Etude et l'Exploitation des Procédés G. Claude. 11,949. 118,103.
Manufacture of Charcoal and Gas. Beccari, G. 13,161. 128,791.
Cracking Hydrocarbons. White, A. E. (Sinclair Refining Company) 14,865. 128,806.
Artificial Fuel. Evans, D. 15,991. 128,815.
Antimonious Oxide. Morris, E. F. 16,333. 128,818.
Recovery of Tin from Tinned Metals. Gregory, A. W. 18,818. 128,833.
Completely Gasifying Combustible Carbon Matter. Colson, L. 19,378. 121,124.
Preservative for Wood. Mehta, R. A. 19,988. 128,843.

1919.

Vulcanising Rubber Goods. Jackson, W. J. Mellersh- (American Rubber Company). 384. 128,852.
Draining-valve for the Delivery Pipes or Pumps. Hawes, G. T.; and Loders and Nocoline, Ltd. 11,001. 128,891.
Composition for Preventing and Removing Incrustation in Boilers. Urruty, J. 12,046. 126,966.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Explosives. F. Howles, Broughton, Manchester. British Patent, 125,600, of 1916.

Consists in using as an explosive the known salt of dinitro-diazophenol obtained by reducing one nitro-group in picric acid, and treating the resulting amido compound with nitrous acid in the presence of nitric or hydrochloric acid.

Nitric Acid. J. W. Leitch, Huddersfield. British Patent, 125,616, of 1916.

Highly concentrated nitric acid, such as 91 per cent. acid, is prepared by distilling nitrate of soda or dilute nitric acid with relatively weak sulphuric acid as brown oil of vitriol of 84 per cent. strength, and passing the vapours through a fractionating-column or other dephlegmator so that water or the weaker acid flows back to the still. The temperature of the column may be regulated, as by a steam-jacket or by the heat of the vapours and the still, so regulating the strength of the distillate. The operation may be effected under reduced pressure.

Nitric Acid and Ammonium Nitrate. F. S. Washburn, New York. British Patent, 125,601, of 1916.

In the catalytic oxidation of ammonia, using preferably a platinum catalyst, the stream of ammonia and air is passed through the apparatus at such a rate that some of the ammonia escapes oxidation, so that a mixture of ammonium nitrate and nitric acid is obtained.

The gases are passed from a pipe 1 through a catalytic chamber 3, and traverse a cooler 4 to screen them from heat, radiated from an electrically-heated platinum catalyst 5. The oxidised gas is passed through a cooler 9 and absorption towers 11, 15. Ammonia may be admitted by a pipe 40 to convert the free nitric acid into ammonium nitrate; or the solution containing ammonium nitrate and nitric acid may be distilled to separate the acid and recover the salt; or sulphuric acid may be added to produce ammonium sulphate and nitric acid.

Extracting Copper and Nickel. B. Mohr and C. Hererlein, London. British Patent, 125,642, of 1916.

Copper and nickel in Bessemerised copper-nickel matte are separated by calcining the finely ground matte until the sulphides become oxides, reducing the calcined matte, treating the reduced matte with acid so as to dissolve the nickel but not the copper, and then electrolysis the nickel solution so as to deposit nickel. The anodes and cathodes of the electrolytic cell may be respectively of lead and nickel. From the anode compartment of the cell, the electrolyte, containing about 10 per cent. of free sulphuric acid, flows into the first of a series of leaching-vats, into which reduced matte is fed for the production of a fresh supply of electrolyte.

Vulcanising Indiarubber. Dunlop Rubber Company, Westminster; and D. F. Twiss, Sutton Coldfield, Warwickshire. British Patent, 125,696, of 1918.

An accelerator of vulcanisation consists of caustic alkali dissolved in an organic compound (other than glycerol or glycol) of predominant hydroxylic character such as butyl or amyl alcohol or phenol. The compounds in question are limited to those that are fluid at the ordinary temperatures or are fusible at about 120° C. Specification 110,059 is referred to.

Fertilisers. E. C. R. Marks. (A communication from the Soc. Anon. Italiana G. Ansaldo and Co., Genoa, Italy.) British Patent, 125,718, of 1918.

A fertiliser containing potassium compounds and also phosphorus compounds, soluble in, for example, ammonium citrate, is prepared by heating to incipient fusion a mixture of potash-containing minerals, such as feldspar, kaolin, silicate, etc., phosphate-containing substances such as mineral tricalcium phosphate and silica. The product is stated to contain a phosphate of potassium and calcium in presence of silicate of calcium.

Tin Oxide. A. W. Gregory, Greenwich, London. British Patent, 125,879, of 1918.

Sodium sulphostannate solution is treated with an ammonium salt and boiled in contact with air, tin oxide and sulphide being precipitated. If air is blown into the solution,

tin oxide only is obtained. Alternatively, air may be blown into the solution, producing sodium stannate, which is subsequently or concurrently treated with carbonic acid or ammonium carbonate or any bicarbonate to precipitate tin oxide, a final addition of an ammonium salt being made to precipitate any remaining tin. In another modification, air and carbonic acid are employed, with the addition of an ammonium salt. In an example, ammonium sulphate is employed, with or without a current of air.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Alumina and Calcium and Alkali Nitrates. Norske Aktieselskab for Elektrokemisk Industri Norsk. Industri-Hypotekbank, Christiania, Norway. British Patent, 125,578. Convention date, April 8, 1918.

Alumina and calcium and alkali nitrates are obtained from labradorite or other minerals containing plagioclase by treatment with nitric acid, removing dissolved iron, evaporating to dryness, calcining to about 300° C. to decompose aluminium nitrate, and separating the other nitrates from the alumina by leaching. The labradorite is leached with 30 per cent. nitric acid in vats A, A¹, A² on the counter-current principle, the neutralised liquor being received in a vat C. After removal of iron by a basic substance—for instance, alumina

or limestone or potassium ferrocyanide,—the solution is evaporated in vacuum apparatus F to near dryness, so that on calcination of the residue in apparatus D, nitric acid of 30 per cent. strength may be obtained in a condenser G, though the evaporation may be carried so far that 60 per cent. acid is obtained on calcination. The calcined residue is lixiviated in vats E and the alumina is calcined in apparatus J. Nitrogen oxides from the vats A, A¹, A², the calcining apparatus D¹, and the condenser G are led to towers B, B¹, B², B³ for producing nitric acid from atmospheric nitrogen, the hot gases from the oxidation being used as indicated for heating the vats A, A¹, A² and the calcining apparatus D, J.

Aromatic Ureas. A. V. Blom, Bern. British Patent, 125,584. Convention date, April 17, 1918.

Asymmetric ureas are prepared by the reaction of phosgene at about 40° C., in the presence of agents neutralising hydrochloric acid, upon mixtures of equimolecular parts of an aminonaphthol sulphonic acid and an aromatic diamine, one of the amino groups of which is protected either by an *o*-substituent or by substitution by formyl, etc., groups, this group being subsequently split off. Examples are given of the preparation of ureas from 2 : 5 : 7-aminonaphthol sulphonic acid and *m*-toluylene-diamine or formyl-*m*-phenylenediamine; *p*-toluylenediamine, chlor-*m*-phenylenediamine; chlor-*p*-phenylenediamine, formyl-*p*-phenylenediamine, *m*- or *p*-diaminoanisole, *m*- or *p*-diaminophenetol, benzidine sulphonic acid, and diaminodiphenylurea, are also specified as parent diamines.

Electrolysis. Norsk Alkali A./S., Drontheim, Norway. British Patent, 125,935. Convention date, April 25.

To check excessive flow of an alkali-chloride solution at the cell wall past a substantially horizontal diaphragm, fillets, rods, pipes, or the like of stoneware, china, glass, concrete, etc., are placed on or partly embedded in the diaphragm near the wall, and the troughs thus formed are filled with material such as finely-powdered asbestos, alumina,

clay, barium, sulphate, or iron oxide, wetted with water or a salt solution. The fillets may constitute a single frame. The diaphragm, which rests on the perforated or netted cathode, is of asbestos board or cloth covered with an inert powder, or of pulverulent or fibrous material only.

AMERICAN NOTES.

[FROM OUR OWN CORRESPONDENT.]

NEW YORK, June 22, 1919.

IT developed at hearings in Washington this week relative to protecting the American dye industry that Count Johann von Bernstorff, while serving as German Ambassador to the United States, after the war had started but before the United States had become involved in it, tried to cripple the American industry in 1915 through stopping German dye importations. He hoped thereby to arouse American sentiment against the British blockade, and thus aid Germany. Bernstorff was advised by one Hossenfelder that the stock of dyes in this country was so small that such an embargo would throw 4,000,000 American workmen out of employment. This and other revelations of German activities were presented to the House Ways and Means Committee, which is investigating the subject of protecting the American dye industry.

Francis P. Garvan, Alien Property Custodian, and Joseph H. Choate, jun., President and General Counsel respectively for the Chemical Foundation (which has control over all German dye and chemical patents in the United States), have presented to the House Ways and Means Committee a brief in favour of a Bill establishing the licensing plan to control dye imports. In it they embrace excerpts from Bernstorff's despatches. The brief states that the late Dr. Hugo Schweitzer, president of the American branch of the great German house of Bayer, came to the United States, and became a citizen at the request of his Government, and led propaganda and espionage activities until his death in 1917. He was a direct secret service employee of the German Government, the brief asserts. The brief discloses that mustard gas was discovered in this country, and its formula transmitted to Germany by Dr. Schweitzer through Von Papen, the former Naval Attaché of the Germany Embassy after the war began.

The licensing plan for dye imports, recommended by the Chemical Foundation, is a temporary measure designed to cover the period necessary for the building up of a complete self-sustaining coal-tar chemical industry in this country. It permits the importation of coal-tar products in any quantity or any quality, at any price, from any source, when—and only when—the proposed import is licensed by a Licensing Commission appointed by the President, and consisting of, as has been suggested, four members chosen from among the dye manufacturers, an equal number from among the dye-using industries, and one member not connected with either industry and representing the Government itself. The duty of the Commission under the proposed Bill would be to admit by licence all dyes and other coal-tar chemicals found really necessary and not obtainable from domestic sources within a reasonable time and not replaceable by any entirely satisfactory domestic substitute. The Bill would exclude from importation all such products as are now or presently will be manufactured in the United States in satisfactory quantity and quality.

It is stated that the licensing system is not an embargo nor a substitute for a Customs tariff, which may be levied regardless of the licensing plan. The Chemical Foundation officials state that "no one would advocate its enactment for a period of more than, say, ten years. If at the end of that time our dye industry has not reached or nearly reached a self-sustaining status, it will have been proved that the Germans were right in their repeated assertions that we are incapable of establishing such an industry."

In stating several important reasons why the United States should have its own independent dye industry, the Chemical Foundation gives most prominence to the question of national defence. "Only a dye industry," it is stated, "can provide for national defence. It is common knowledge that nearly all modern military explosives are coal-tar products. Less well known is the fact that a complete dye works can be almost instantly converted into an explosives factory. If we allow Germany to regain her world monopoly of dyes, we offer her as a free gift capacity for world conquest. A hostile dye industry is an ideal centre of espionage and propaganda."

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—Last month's shipments from Chili were again on a very small scale—i.e., 36,000 tons,—of which only 4,000 tons to Europe, 20,000 to the United States, and 12,000 to "other parts"; the respective figures in June last year were 107,000, 133,000, and 5,000 tons; together, 245,000 tons. The output was further reduced to 128,000 tons (against 236,000 tons last year), but a considerable addition, it will be seen, was made to the stocks on the West Coast, these reaching the record total of close on one and a half million tons. The prospects of moving these stocks have not improved so far as the Associated Producers are concerned, since the scarcity of tonnage continues, British vessels being precluded from loading nitrate, while "neutrals" can obtain elsewhere rates of freight far above the nominal quotation of 100s. per ton to the United Kingdom; shipments to this country are therefore practically confined to parcels by "liners," representing a more drop in the ocean. It is to be hoped that the veto on shipping will be removed in time for next season in Europe; but, in any case, it is quite evident that sufficient tonnage will not for some months be available to make much impression on the "centralised" supplies on the other side. While business in nitrate of soda is in abeyance during the dead season here, it is practically at a standstill in Chili, where, under ordinary circumstances, it would be brisk in the shape of "forward" sales. We will revert in our next issue to the large operations conducted by the Chilean Government on behalf of the producers outside the Association.

Algerian Phosphate Troubles.—According to an estimate made of the production of phosphates in Algiers during the year 1919, it appears that it is expected this would require to be not less than 2,490,000 tons in order to supply the requirements of France herself, the Allies, and neutral countries. It cannot be expected to exceed a total of 1,400,000 tons. This unfortunate outlook is brought about through a lack of labour and the poor condition of the ways of communications, as well as material. It appears that the French Government have begun to negotiate with the English Government for the purpose of obtaining the necessary freights to move the goods. On the other hand, the industrialists are calculating on being able to dispose of a certain number of German vessels as soon as they have been delivered to France, which, it is hoped, will be put on the service between France and Algiers.

A Prosperous Alsatian Potash Concern.—The Deutsche Kaliwerke, according to a report from Alsace, in which the property of the company is situated under sequestration since the armistice, raised its capital last year from 30,000,000 marks to 40,850,000 marks. The profit realised during the 1918 working year makes a total of 7,130,000 marks, as against 5,200,000 marks in the year 1917. The net profit is put at 4,588,600 marks, as against 3,859,724 marks. The dividend is recommended to be 7 per cent., as compared with 8 per cent. distributed in the preceding year.

Sulphate of Ammonia.—Not a great deal of interest is moving in this market at the present time. Prices are arranged for the next few months, and the farmer can well afford to pay these in view of the high prices he himself is securing for his produce. Should, however, the tendency of the markets go against the farmer, and his own prices fall, there is no doubt he will seek to persuade manufacturers that he deserves help in the way of lower sulphate and allied prices. How these are to mature, however, is not certain, because there, again, higher costs are prevailing, and seem likely to prevail in the absence of any unforeseen developments. News from New York indicates that sulphate of ammonia there is firm, with recent sales notified ranging from 1,000 to 1,200 tons for export. Domestic requirements are moderate, although there is sufficient business passing to prevent the market sagging away.

Basic Slag.—In a somewhat dull period, slag movements are perhaps the most active spot. Bookings are now taking place in this for deliveries throughout the season. Representative prices as arranged are: Prime quality slag, guaranteed 12-22 per cent. phosphate, in bags, carriage paid, £3. 2s. to £3. 12s. per ton, with 24-42 per cent. at £3. 15s. to £5. 2s. per ton.

Superphosphate.—This is quiet, but higher prices are looked for. During last season phosphate rock and other materials were supplied to the makers by the Government at under market prices. With the discontinuance of this help, costs must be more substantial. Current quotations for a good brand, guaranteed 30 per cent. soluble, in bags,

are £6. 10s. per ton, ex works, with 33 per cent. at £7. 2s., and 35 per cent. at £7. 10s.

Potash.—No especial changes are notified in potash prices here this week, either for sulphate or kainit. From America it is reported that muriate of potash realises 10s. to 10s. 6d. per unit. This material does not appear to be regularly quoted here. A paper read before a recent meeting of American mining engineers speaks of a new form of fertiliser called ionised potash. The inventor claims to have found a process for treating felspar and other rocks which gives them a rate of dissolution five million times that of nature. So treated they will give up their potash, not to water, but directly to the plant through the action of plant acids. It is asserted that this does not wash away as German potash does. Whilst admitting that it does not fertilise as quickly, it is said to stay in the soil much longer, and to be cheaper and more effective in the long run than German potash.

Other Fertilisers.—Imported bones are a firmer market, and bone meal is all the time in fair demand, without any special change in prices. Meat meal is somewhat difficult to obtain at present, and fish meal is said to be in good demand at prices which sometimes run up to 27s. 6d. There is a moderate inquiry for dried blood at recent values, and a fair call for foreign tankage, at prices which in one quarter are mentioned as 25s. per unit for ammonia and 2s. for phosphate.

Italian Fertiliser Production Extends.—It is announced that the Unione Concimi has decided to construct two large factories, each capable of producing 600,000 quintals of superphosphates. One of these factories will be situated at Venice and the other near Naples. It is hoped they will be ready for producing superphosphates by the autumn of 1920.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

Tinplate manufacturers are unwilling to commit themselves to any great extent for forward deliveries owing to the unsettled state of the industrial problems, and they state that at present they cannot perceive any safeguard as to the future prices of raw material and cost of labour. A temporary general additional bonus of 12½ per cent. has been granted to the tinplate employees as from June 30 to September 27.

The Cardiff Pure Ice Company have given out a contract for the erection of an additional ice factory at the Docks, and machinery is to be installed capable of manufacturing nearly 20,000 tons per annum, besides providing cold storage. Additions are also to be made at the Newport works of the company.

There is no falling-off in the demand for patent fuel, and there are indications that this important industry is to be still further enlarged in the near future. Cardiff makers have executed foreign orders during the week for St. Nazaire and Algiers, nearly 8,000 tons going to these two ports. Newport shipped to Rouen 2,300 tons. Cargoes left Swansea for Catania 2,000 tons; St. Nazaire, 2,300 tons; Casa Blanca, 3,600 tons; and Valencia, 300 tons.

The demand for coke is better. The coke ovens are working well, and the supply of sulphate of ammonia is very regular.

Matters in the spelter industry are a little brighter, and there is more interest being shown by consumers of this metal. During the week 2,000 tons of zinc concentrates arrived from Australia, and two cargoes from Port Pirie, besides 4,862 tons of zinc ore transhipped at Manchester to Swansea.

Indications of an extensive oilfield are reported to have been discovered in Cardiganshire, and investigations are being made by Lord Cowdrey's geological experts. Paraffin wax, indicating that the peat generates paraffin, has been found in the great peat bog at Tregaron. Some years ago this bog was explored by German chemists, who, by distillation, obtained the following products: Lubricating oil, vegetable naphtha, camphor, ammonia, paraffin wax, and tar. The bog extends to 4,000 acres.

ZINC AND ZINC DUST PRICES.—The quotation for Australian high-grade zinc dust (88-92 per cent. metallic zinc) is unchanged at £70. per ton, f.o.r. Probably owing to the continuous rise in the market price of spelter, inquiries for zinc dust have been more abundant during the past week. The price of Australian electrolytic zinc (99.95 per cent. metallic zinc) remains at £40. per ton, f.o.b. Australia for direct shipment to New Zealand, India, South Africa, and the Far East.

NEW COMPANIES.

Lowe, Clayton and Hicks, Ltd.—Capital £5,000., £1. shares. Object: To acquire the business of colour merchants carried on by W. D. Hicks-Ussher, under the style of Lowe, Clayton and Hicks. Office: 18, Stratford Road, Acton, W. 3.

Caledonian Metal Company, Ltd.—Private company. Capital £1,000., £1. shares (500 "A" and 500 "B"). Object: To acquire patents for metallurgical processes. Office: 400, Caledonian Road, N. 1.

Chambers Bros., Ltd.—Private company. Capital £6,000., £1. shares. Object: To acquire the business of a manufacturer of refractory materials of every description carried on by Samson Chambers, trading as "Chambers Bros." Office: Effingham Mills, Stoke Street, Attercliffe, Sheffield.

International Icilma Trading Company, Ltd.—Private company. Capital £250,000., £1. shares (125,000 preference). Manufacturers of and dealers in soaps, creams, etc. Solicitors: Ashurst, Morris, Crisp and Co., 17, Throgmorton Avenue, E.C.

MARKET REPORTS.

FRENCH CHEMICAL MARKET.

PARIS, July 4.

The market has been firm during the last fortnight, but business has been still unimportant. It is hoped, however, that transactions will soon resume, but things are not yet sufficiently settled to allow a normal course of business. Alum has been in fair demand, and stocks are cleared to a certain extent. Some orders have been handed to English manufacturers at rather low prices. Sulphate of alumina is still quiet. The position of white arsenic has not improved, and demand is exceedingly small, though there are low offers to hand. Liquid ammonia is quite scarce, and prices are hardening. Home manufacturers are busy, and some quantities have been imported from England. Sal ammoniac powder is quiet at reduced prices, whereas lumps are in fair request at unchanged prices. Phosphate of ammonia is firm and in good demand from the South of France. Barium salts are dull, which applies to barium chloride as well as carbonate. Barium binoxide is more active. Natural French barytes are now freely to hand and ready for export. Sulphate of copper is quiet at about 125frs. per 100kilogs., delivered buyer's station, equal to £40. per ton, c.i.f. Channel port. The demand for borax and boric acid is considerable, and available lots are sold at high prices. Calcium chloride is in poor demand, stocks being still extensive. The 70/75 grade, in free drums, is valued to-day at 38frs. to 40frs., ex stock Paris, equal to £11. per ton, c.i.f. Channel port. Bleaching powder, 35/37%, is wanted in large quantities, the most of which is supplied by French manufacturers, delivered free buyer's station, at 50frs. per 100kilogs. Some lots have been imported from England at low prices—viz., 38frs. per 100kilogs., or £13. per ton, c.i.f., French port. Carbonate and phosphate of lime are almost left aside. Epsom salts are in better demand at somewhat reduced prices, and orders have been placed abroad. Carbonate of magnesia is dull, and prices are weak. Calcined magnesia is firm, but business has been very small. Glauber salts are freely to hand, and offered at low prices. Caustic soda is rather scarce, but quotations remain at a low level, as previously. The same applies to soda ash and bicarbonate of soda. Sodium sulphide is in good demand, and manufacturers are quite busy. Sodium fluoride is produced now in France in sufficient quantities. The price of phosphate of soda is low, the demand being very small from silk manufacturers. This product is now offered at 80frs. per 100kilogs., delivered free, equal to £24. per ton, c.i.f. Channel port. Zinc compounds are as inactive as before, and practically nothing has been imported. White lead is still in huge demand at high prices, whereas red lead and litharge are dull. Bichromate of soda and potash are offered at greatly reduced rates by American manufacturers, and prices are at present at an exceedingly low level, the demand being fairly good. Chrome alum is in good request at unchanged prices. Oxalic acid is scarce, but prices are rather low, which applies also to salacetas. On June 18 several important overtaxes *ad valorem* were added to existing Customs duties.

TAR AND AMMONIA PRODUCTS.

WEDNESDAY.

Benzole: London, 90%, 1s. 11d. to 2s.; North, 1s. 9d. to 1s. 10d.; 50%, 1s. 9d. to 1s. 10d.; North, 1s. 9d., naked. Carboic acid, crude, 60%, East and West Coast, nominally 1s.; crystals, 30-40%, 5d. to 5½d., f.o.b. Crude tar, London, 42s. to 43s.; Midlands, 37s. to 38s.; North, 36s. to 37s. per ton, ex works. Pitch, 72s. 6d. to 75s.; East Coast, 62s. 6d. to 63s. 6d., f.o.b.; West Coast, 51s. to 53s., f.a.s. Solvent naphtha, naked, London, 90-100%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 90-100%, naked, London, 2s. 1d.; North, 1s. 10d. to 1s. 11d. Crude naphtha, naked, 30%, 8d. to 8½d.; North, 7½d. to 7¾d. Refined naphthaline, £18. to £22.; salts, £6. to £7. Toluol, naked, London, 2s. 1d.; North, 2s. Creosote,

naked, London, 5½d. to 5¾d.; North, 5d. to 5½d.; heavy oil, 7½d. to 7¾d. Anthracene, 40-45%, 6d. per unit. Cresylic acid, 95%, 2s. 7d. to 2s. 8d.; 97-99%, 2s. 9d. to 2s. 10d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: Home trade, £19. 10s. per ton; basis 24½%. Nitrate of soda, £21. to £22.

FERTILISER MATERIALS.

LIVERPOOL, THURSDAY.

Nitrate of soda is firmer, and the quotation for 95/96% quality has been advanced to £21. 2s. 6d. per ton, net cash, f.o.r., prompt delivery. East Indian bone meal: Shippers of this material are firmer in their views, the nearest value of 4½% ammonia and 52% phosphates, August-September shipment, being now £13. per ton, net cash, ex ship Liverpool. On spot, holders are also firmer, and now require £14. per ton, net cash, for 4½% and 45% quality. Mineral phosphates are without alteration, and values are at present only nominal. Dried blood is rather irregular, the nearest value being about 25s. to 30s. per unit of ammonia per ton; net cash.

LONDON METAL MARKET.

THURSDAY.

Copper: Standard brands, £97. 10s. to £97. 15s., cash; £98. 10s. to £98. 15s.; three months; electrolytic, £100. to £105. Tin: Standard, £249. 10s. to £250., cash; £247. 10s. to £247. 15s.; three months; Straits, £250.; English, £247., f.o.r. Lead: Soft foreign, £23. 12s. 6d.; English, £24. 10s. Spelter, £41. 10s.; hard, £32. Antimony, English regulus, 90%, £45. Aluminium, £150. Nickel, £195., delivered, packages extra. Quicksilver, £21. to £21. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 30s. per unit.

SWANSEA MARKET REPORT.

THURSDAY.

Tinplate prices have become somewhat irregular, and quotations are round 32s. 6d. per box, standard basis. Copper is in a stronger position, and purchasers more numerous. For prompt delivery £93. 10s. has been given, and for three months £95. per ton. Tin slightly dearer at £240. cash and £245. three months. Lead quiet, but steady; Spanish, £22. 15s. per ton; English, £23. 15s. prompt, and 10s. less for delivery next quarter. Spelter has a firmer tone at £40. per ton prompt. Zinc sheets, £65. per ton, f.o.b. New York. Silver, 53½d. per ounce. Aluminium unchanged at £150. Nickel quiet at £195., delivered free London or equal. Quicksilver, £21. per bottle. Antimony unchanged, with English 90% regulus at £45. Linseed oil very scarce at 122s. per cwt. Cotton seed oil, 135s. Turpentine, 88s. 6d. per cwt. Sulphate of copper quiet, with home trade prices at £45. per ton, and export £47. to £48., f.o.b. Sulphate of ammonia remains steady, and is for home requirements £19. 10s. per ton for forward delivery. Nitrate of soda selling better at 21s. 6d. per cwt., in bags, net. Arsenic in better demand at £35. per ton for white powdered, f.o.b. Oxalic acid remains somewhat quiet at 1s. 3d. per lb.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

There is a slight improvement in demand for heavy chemicals both on export and home trade account, and values as a whole show only small variation during the past week. White caustic soda, 70%, is quiet at £18. 10s. per ton. Refined bicarbonate of soda, bags, £8. net; and 58% alkali at £6. 5s. per ton. Bleaching powder steady at £15., on rails, softwood casks. Roasted saltcake firm at 60s. per ton, carriage paid. Chlorates are unaltered at 1s. 3d. and 7½d. per lb. for potash and soda respectively. Bichromates remain at recent rates. Soda crystals, bags, £4. 2s. 6d., on rails. Recovered rock sulphur easy at £19., on rails works. Sulphate of copper continues flat, and export quotation nominal at £45. per ton, f.o.b. Nitrite of soda is higher on the spot at £56. per ton.

Phosphate of soda has an upward tendency. Concentrated sodium sulphide in small request at £22. per ton. White powdered arsenic is again in short supply, and price higher at £40. per ton for Cornish brands. Yellow prussiate of potash steady at 1s. 9d. per lb. Soda, 7½d. per lb. Carbonate of potash, 80-85%, quoted at £85. per ton. Lead salts are moving off fairly well, and prices are unchanged. Acetate of soda, £54. per ton. Acetic acid in fair demand, and quotations steady. English brown acetate of lime in good request at £10. per ton. American grey is dearer on account of increased freights, at £19. to £20. per ton. Miscible and solvent wood naphtha unaltered at 10s. 6d. per gallon. Owing to increase in output, price of green copperas is steadily falling. Oxalic acid moves well at 1s. 2½d. to 1s. 3d., delivered.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

A very fair inquiry for chemicals has been experienced. The stoppage of work in branches of the cotton trade has affected business in some chemicals unfavourably, but inquiries have come in more freely from other directions and also on export account. This is maintaining a fair degree of activity in the home and export branches of the trade. Bleaching powder has again been in moderate demand, and is £14. 10s. to £15. per ton, free on rail or conveyance, in buyer's packages, and £15. to £17. per ton, for export. Chloride of calcium has been more inquired for, and is £8. to £11. per ton, in casks, f.o.r. Caustic soda has again been in good request on home and on export accounts. Prices may be given as £24. per ton, for 76 per cent.; £22. per ton for 70 to 72 per cent., and £19. per ton for 60 to 62 per cent. Nitrate of soda has been rather more in demand, and is £20. 10s. to £21. per ton. Sulphate of soda has again been in very fair request, and is £6. 10s. per ton, in casks, f.o.b. Soda crystals have sold with some freedom, and are £5. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda continues in fairly active demand, and is £7. 5s. to £10. per ton, according to terms of delivery. Hyposulphite has met with a steady inquiry, rather more interest being visible in the export branch of the trade. Prices are £19. to £20. per ton for "ordinary" crystals, in 2cwt. bags, and £25. per ton for "pea" crystals, in 1cwt. kegs. Sulphite of soda has been in moderate request, and is £11. per ton for "ordinary" and £18. to £19. per ton for "pea" crystals, in 1cwt. kegs. Ammonia alkali has been steadily called for, and is £6. to £6. 5s. per ton, f.o.r. at works. Borax has been in very fair demand, and is £42. per ton for ordinary and £44. per ton for powdered, in bags. Bichromate of soda has been rather more in request, and is 9d. per lb. Phosphate of soda has been quiet, and is £25. per ton. Sulphide of sodium has been but little in demand, and is £20. per ton, in casks, and £22. per ton, in drums. Chlorate of potash has been more inquired for, and is 1s. 1d. to 1s. 2d. per lb. Permanganate of potash has been steadily called for, and is 3s. 6d. per lb. Sulphate of potash has moved but slowly, and is £40. per ton. Carbonate of potash has again been in fair demand, and is £85. to £90. per ton, for 80 to 85 per cent. Caustic potash has been in good request, and is £160. per ton, for 35° Bé. Nitrate of potash has met with a very fair inquiry, and is £58. to £60. per ton for refined and £40. per ton for ordinary. Canadian ashes have been but little called for. First quality Montreal are £220. to £225. per ton, and second quality £215. to £220. per ton. Bichromate of potash has been rather more in demand, and is 1s. 6d. per lb. Yellow prussiate of potash has had a moderate sale, and is 1s. 10d. to 2s. per lb. Sal ammoniac has been in quietly steady demand, and is £80. per ton for lump, £75. per ton for seconds, and £5. per ton extra for ground. Sulphate of ammonia has had a fair sale, and is £19. 10s. per ton to September 30. Carbonate of ammonia has been rather quiet, and is 6½d. per lb. Muriate has been inactive, and is £50. to £60. per ton, according to quality. Magnesia has been more in request. Carbonate is £3. 10s. per cwt., and sulphate £10. to £16. per ton, according to grade. Alum has been in good request, and is £18. 10s. for the home trade, and £18. 10s. to £19. 10s. per ton for export. Aluminoferric has been but little inquired for, and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina has had a very limited sale, and is £13. to £18. per ton, according to grade. Sulphur has been rather more in demand, and English flowers are still in small supply. Prices are: Flowers, £32. per ton; roll, £28. per ton; and rock, £22. per ton, in bags, f.o.r. Sicilian kinds are: Flowers,

£28. per ton; roll, £22. 10s. per ton; and third quality, £17. 15s. per ton. Cream of tartar has had a moderate sale, and is £11. 5s. per cwt. Tartaric acid has been in quietly steady demand, and is 3s. 1d. per lb. Boracic acid has been more inquired for. It is £72. per ton for crystals and £74. per ton for powdered. Oxalic acid has been but little called for, and is 1s. 3d. per lb. Citric acid has again been in fair request, and is 4s. 4d. per lb. White acetate of lead has been very quiet, and is £85. to £90. per ton. Arsenic has met with a somewhat freer inquiry, and the price has been raised. It may be given as £39. per ton for white powdered. Sulphate of copper has had a limited sale for farm uses in the United Kingdom. For these uses it is £45. per ton, and for export £47. to £48. per ton, less 5 per cent., in casks, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.

TUESDAY.

Market is steady, and there is a slightly better demand for home consumption. For export also there is an increased inquiry. Soda crystals locally are firm at £5. per ton, 2cwt. bags. Sulphur is very scarce and firm at £22. 10s. to £23. per ton.

The following prices are per ton, net: Bleaching powder, softs and hard, £15.; caustic soda, 74-77%, £23. 5s.; do., 70%, £22.; do., 60%, £20.; recovered sulphur, 2cwt. bags, £23.; hyposulphite of soda, 5-7cwt. casks, £19.; do., 1cwt. keg, £25.; sulphite of soda, 5-7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 74° Tw., £9. 12s. 6d.; do., 100° Tw., £10.; do., 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5.; sulphate of soda (saltcake) in bulk, £3. 10s.; pure white sulphate of alumina, 14-15%, £19. 10s.; blanc fixe, £22.; chloride of barium, £27.; sulphide of sodium, crystals, £18.; do., refined concentrated solid, 60-62%, £25.; hydrate of barium, crystals, £36.

COALS.—Market remains very firm, and prices are fully maintained. Allies' quotations:—Best Northumbrian steam, 70s. per ton; do., second qualities, 60s. to 65s.; Northumberland small coals, 45s.; do., seconds, 40s. to 44s.; best Durham gas coals, 55s. to 57s.; do., seconds, 52s. 6d.; Durham bunkers, 50s. to 55s.; foundry coke, 49s. 6d.; gas coke, 67s. 6d.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

During the past week there has been no perceptible change among the heavy chemicals as far as quotations are concerned, and the tendency meantime is for prices to remain on a very steady basis. Business continues to be somewhat limited, and is confined, generally speaking, to small demands. The Glasgow Fair holiday season is now approaching, and the local chemical works (in company with other industrial concerns in this locality) will close down for the usual Fair vacation somewhere about next week-end. Prices continue to rule as under: Arsenic, £40. per ton, net, Glasgow; bicarbonate of soda, £8. 15s. and £10. per ton for 6-8 casks and 1cwt. kegs, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags, and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £24. per ton, net, Glasgow; chlorate of potash, 1s. 3d. per lb., net, Glasgow; chlorate of soda, 10d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 88%, £11. 5s. per cwt., net, Glasgow; sal ammoniac, £80. and £75. per ton, net, any port, for first and second lump respectively; sal ammoniac crystals £85. per ton, net, Glasgow; saltpetre, £3. 5s. per cwt., net, Glasgow; tartaric acid, 3s. 1d. per lb., 5%, Glasgow.

Among the sea oils there continues a good demand for everything which is on sale, but very often it is a case of the demand being in excess of the supply. Whale oils are on the market in very limited quantities, and neither pale nor yellow is at all obtainable; while brown at 78s. and black at 76s. remain at the old previously quoted levels. Newfound-land cod has been inclined to stiffen in value during the past week, and its current price may be said to be 75s., as against the previous level of 74s.; with a steady demand for everything on offer. Neither pale seal nor Menhaden is on the market.

Coal trade conditions continue on the old footing, and there is no great outcry as far as inadequate supplies are concerned. The industrial demand has slackened off considerably as far as a goodly number of firms are concerned, and the domestic demand is very easy. There is little or nothing doing in the export line, and most of the output continues to be absorbed by the home market.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

BRISTOL.

Lima, 150 pkgs.; Mauritius, 14 pkgs.; Mellila, 30 pkgs.; Pt. Said, 250 pkgs.; Rangoon, 145 pkgs.; Singapore, 15 pkgs.; Tientsin 11 cks.

SODIUM BICARBONATE—

Abo (Finland), 600 pkgs.; Antwerp, 160 pkgs.; Brisbane, 100 kgs.; Christchurch, 30 pkgs.; Christiania, 34 pkgs.; Colombo, 140 pkgs.; Durban, 140 pkgs.; Hong Kong, 168 pkgs.; Karachi, 3,987 pkgs.; Kobe, 1,000 pkgs.; Lima, 20 pkgs.; Lytleton, 120 pkgs.; Montreal, 1,250 pkgs.; Napier, 20 kgs.; Pt. Sudan, 20 pkgs.; Rotterdam, 400 pkgs.; Rustchuck, 100 pkgs.; Shanghai, 224 pkgs.; Singapore, 300 pkgs.; Stockholm, 40 pkgs.; Sydney, 21 pkgs.; Timaru, 20 pkgs.; Valparaiso, 100 pkgs.; Wellington, 54 kgs.

SODIUM CYANIDE—

Batavia, 15 pkgs.; Arica, 5 pkgs.; Totok, 20 cks.

SODIUM SILICATE—

Monte Video, 96 pkgs.

SULPHUR—

Barcelona, 15 c., £55.; Punta Arenas (Costa Rica), 1 c., £7.

SULPHURIC ACID—

Kilindini, 2 c., £9.; Tientsin, 3 c., £14.

SUPERPHOSPHATE OF LIME—

Orotava, 10 t.

TALLOW—

Bordeaux, 80 cks.; Rotterdam, 3 pkgs.

TANNIC ACID—

Barcelona, 4 c., £20.

TARTARIC ACID—

New York, 4 t., £1,268.; Puerto Barrios, 2 c., £45.

WOOD ACID—

Malacca, 7 t. 10 c., £51.

WOOD PRESERVATIVE—

Bombay, 15 c., £9.; Guatemala, 1 t. 5 c., £42.; Lagos, 6 c., £15.

ZINC CHLORIDE—

Alexandria, 7 t. 14 c., £574.; Bombay, 3 t. 5 c., £148.

LONDON.

Week ending July 2.

ACETIC ACID—

Antwerp (F.), 6 brls., £75.; Bangkok, 14 cs., £50.; Calcutta, 2 cs., £5.; Rotterdam (F.), 16 brls., £224.; St. Michaels, 2 brls., £31.; Salonika (F.), 28 cks., £320.

ACETO SALICYLIC ACID—

Constantinople, 13 cs., £338.; Hankow, 1 cs. (pt.), £9.; Naples, 1 cs. (pt.), £6.; Paris, 20 cs., £513.; Pt. Elizabeth, 1 cs., £14.; Sydney, 1 cs. (pt.), £11.; Shanghai, 7 cs. (pt.), £9.

ALUM—

Salonika, 19 c., £19.

ALUM (AMMONIA)—

East London, 4 c., £7.

ALUMINA CHLORIDE—

Genoa, 1 cs., £8.

AMMONIA—

Alexandria, 8 cs., £16.; Bathurst 2 cs., £5.; Bombay, 8 cs., £16.; Calcutta, 10 cs., £20.; Canton, 5 cs., £17.; Madras, 4 cs., £8.; Malta, 6 cs., £12.; Rangoon, 6 cs., £14.; Trinidad, 3 cs., £6.

AMMONIUM ACETATE—

Durban, 2 cs., £19.

AMMONIA (ANHYDROUS)—

Antwerp, 11 cys., £202.; Rangoon, 1 cys., £7.

AMMONIUM BENZOATE—

Melbourne, 1 cs. (pt.), £7.

AMMONIUM BROMIDE—

Bombay, 2 cs. (pt.), £24.; Constantinople, 2 cs., £38.

AMMONIUM CARBONATE—

Auckland, 2 cs. (pt.), £5.; Piraeus, 1 c., £6.; Sibolga, 3 c.; £15.; Segli, 5 c., £24.

AMMONIUM CHLORIDE—

Canton, 1 kg., £7.

AMMONIUM HYDRATE—

Melbourne, 1 cs. (pt.), £9.

AMMONIUM MOLYBDATE—

Adelaide, 3 cs. (pt.), £20.

AMMONIUM MURIATE—

Antwerp, 1 t., £74.; Fremantle, 3 c., £12.

AMMONIUM NITRATE—

Lisbon, 1 t., £45.

AMMONIUM SULPHATE—

Dunkirk, 25 t., £775.; Granville, 300 t., £8,400.; Paris, 20 t., £560.; Samarang, 148 t., £3774.; Soerabaya, 640 t., £16,320.

AMYL ACETATE—

Batavia, 1 cs. (pt.), £19.; Barcelona, 3 drms., £24.

ANTIMONY REGULUS—

Calcutta, 2 c.

ANTIMONY SULPHIDE—

Boulogne, 15 pkgs., £277.; Fecamp, 2 cks., £81.; Lisbon, 11 cks., £15.; Trelborg, 2 cks., £74.

ARSENIC—

Boulogne, 10 t., £390.; Santos, 19 t. 4 c., £1,073.

BARBITONE—

Adelaide (F.), 5 pkgs. (pt.), £18.

BARIUM NITRATE—

Bombay, 15 cks., £98.

BENZOIC ACID—

Italy, 3 cs., £136.; Melbourne, 1 cs. (pt.), £8.; Naples, 3 cs. (pt.), £45.

BISMUTH CARBONATE—

Amsterdam, 2 cs. (pt.), £18.; Dunedin, 1 cs. (pt.), £22.; East London, 1 cs. (pt.), £11.; Madras, 1 cs. (pt.), £16.; Melbourne, 1 cs. (pt.), £40.; Shanghai, 8 cs. (pt.), £38.; Trinidad, 1 cs. (pt.), £22.

BISMUTH CITRATE—

Brisbane, 1 cs., £26.

BISMUTH OXYDIOGALLATE—

Amsterdam, 2 cs. (pt.), £8.; Batoum, 1 cs. (pt.), £12.

BISMUTH SALICYLATE—

Constantinople, 2 cs., £41.; Madras, 1 cs. (pt.), £7.; Sydney, 1 cs. (pt.), £20.

BISMUTH SUBGALLATE—

Amsterdam, 2 cs. (pt.), £17.; Shanghai, 7 cs. (pt.), £8.

BISMUTH SUBNITRATE—

Amsterdam, 2 cs. (pt.), £16.; Batoum, 1 cs. (pt.), £20.; Constantinople, 1 cs. (pt.), £40.; East London, 1 cs. (pt.), £10.; Madras, 1 cs. (pt.), £14.; Melbourne, 1 cs. (pt.), £18.; Rotterdam, 1 cs. (pt.), £80.; Shanghai, 7 cs. (pt.), £35.; Trinidad, 1 cs. (pt.), £20.

BISMUTH SUBSALICYLATE—

Amsterdam, 2 cs. (pt.), £8.

BLEACHING POWDER—

Antwerp, 10 t. 6 c., £135.

BORAX—

Amsterdam, 1 t., £60.; Switzerland, via Antwerp, 10 t., £390.; Batoum, 10 c., £21.; Beyrouth, 10 c., £20.; Cape Town, 10 c., £20.; Colombo, 2 c., £5.; East London, 2 c., £7.; Para, 10 c., £32.; Rotterdam, 37 t. 17 c., £1,891.

BORIC ACID—

Amoy, 3 c., £17.; Batoum, 8 c., £31.; Bombay, 3 c., £7.

BORIC ACID—

B. Ayres, 7½ t., £790.; Durban, 3 c., £12.; Hankow, 4 c., £16.; Launceston, 1 c., £6.; Melbourne, 2 c., £8.; Rotterdam, 4 t. 19 c., £364.; Swatow, 1 c., £6.; Trinidad, 2 c., £7.

CALCIUM CARBIDE—

Aden, 2 t. 10 c., £80.

CALCIUM CHLORIDE—

Bombay, 1 t. 7 c., £17.

CALCIUM LACTATE—

Cape Town, 1 cs. (pt.), £12.

CARNAUBA WAX—

Durban, 10 c.

CAUSTIC SODA—

Batoum, 19 t. 18 c., £398.; Paris, 9 t. 19 c., £300.

CERESINE WAX—

Amsterdam, 2 t.; Antwerp, 12 c.; Rotterdam, 11 t.

CHEMICALS (otherwise undescribed)

Adelaide, 9 pkgs., £101.; Antwerp, 1 cs., £26.; Brussels, 80 brls., £98.; Colombo, 4 cs. (pt.), £19.; Durban, 1 cs. (pt.), £20.; East London, 1 cs. (pt.), £12.; Fremantle, 14 cs., £130.; Karachi, 15 cs., £47.; Madras, 1 cs., £12.; Melbourne, 67 pkgs., £536.; Pt. Elizabeth, 1 cs., £9.; Rangoon, 2 brls., £21.; Seville, 2 cs., £76.; Shanghai, 2 cs. (pt.), £32.

CHLORIDE OF LIME—

Pt. Elizabeth, 2 c., £5.

CHROMIC ACID—

Soerabaya, 2 cs., £120.

CHRYSOGRAPHIC ACID—

Madras, 1 cs. (pt.), £9.; Rangoon, 1 cs., £6.

CITRIC ACID—

Amsterdam, 5 c. (F.), £130.; Cape Town, 5 c., £120.; Jaffa, 2 c., £15.; Karachi, 1 cs. (F.), £9.; Madras, 1 c., £13.; Malta, 1 c. (F.), £25.; Montreal, 5 c., £113.; Shanghai, 2 c., £33.; Toronto, 5 c., £113.; Trinidad, 1 cs. (pt.), £6.

COAL PRODUCTS—

Alizarine
New York, 4 kgs., £96.

Aniline Colour

Hong Kong, 1 cs. (pt.), £16.; Penang, 2 cs. (pt.), £50.; Singapore, 2 cs., £44.

Aniline Dye

Adelaide, 1 cs., £8.; Amsterdam, 2 kgs., £66.; Bombay, 2 kgs., £246.; Calcutta, 5 pkgs., £563.; Lytleton, 5 kgs., £112.; Melbourne, 100 pkgs., £2,450.; Para, 1 pkg. (pt.), £9.; Sourabaya, 1 kg., £9.; Sydney, 2 cks., £74.

Bitumen

Dunkirk 30 pkgs., £94.

Carbolic Acid

Bangkok, 4 drms., £27.; Brisbane, 1 cs., £6.; Canton, 1 cs. (pt.), £8.; Haarlem, 2 cs., £9.; Karachi, 2 cs., £17.; Kilindini, 3 cs. £8.; Shanghai, 3 cs., £12.; Singapore, 10 drms., £14.

Creosote

Lisbon, 83,455 gals., £2,081.; Paris, 50 brls., £330.; Switzerland, 6 brls., £78.

Cresylic Acid

Paris, 53 cks., £453.

Naphthalene

Alexandria, 8 cks., £42.; Archangel, 1 ok., £12.; Batoum, 39 cks., £125.; Durban, 14 cks., £32.

Pitch

Alexandria, 90 cks., £105.; Antwerp, 710 t., £2,364.

Tar

Beira, 100 drms., £33.; Cape Town, 72 drms., £7.; Delagoa Bay, 50 drms., £14.; Durban, 150 drms., £27.; Lisbon, 100 cks., £158.; Singapore, 40 drms., £18.; Stockholm, 270 drms., £425.

Terebine

Cape Town, 2 cs. (pt.), £14.; Durban, 5 cs., £29.

COCOANUT OIL ACID—

Paris, 10 t. 2 c.

COPPER SULPHATE—

Rotterdam, 282 t. 4 c., £16,946.; San Thome, 1 t. 5 c., £58.

CREAM OF TARTAR—

Cape Town, 1 c., £14.; Cape Town, 7 c. (F.), £83.; East London, 4 c., £62.; Jaffa, 2 c., £23.; Karachi, 3 c. (F.), £49.; Madras, 1 c. (F.), £12.; Maranham, 1 c., £27.; Pt. Said, 1 c. (F.), £12.; Shanghai, 7 cs., £6.; Brisbane (transit), 1 t. 2 c. (F.), £300.

DISINFECTANTS (otherwise undescribed)

Auckland, 2 c., £8.; Batavia, 13 c., £25.; Bombay, 4 c., £44.; Brisbane, 1 t. 7 c., £59.; Brussels, 4 c., £7.; Calcutta, 1 c., £12.; Canton, 2 c., £15.; Cape Town, 10 t. 9 c., £461.; Channel Islands, 10 c., £6.; East London, 2 c., £7.; Ghent, 1 t. 7 c., £51.; Hankow, 1 c. (F.), £8.; Hobart, 2 c., £7.; Ipoth, 2 c., £10.; Karachi, 1 c., £6.; Lisbon, 2 c. (F.), £10.; Malta, 1 c., £9.; Montreal, 2 t., £143.; New York, 6 t. 15 c., £350.; Paris, 9 t. 4 c., £240.; Penang, 1 t. 16 c., £78.; Punta Arenas, 1 c., £8.; Rangoon, 1 t. 10 c., £74.; Singapore, 2 c., £24.; Toronto, 2 c., £14.; Wellington, 15 c., £32.; Zanzibar, 19 c., £45.

EMYL ACETATE—

Paris, 1 cs., £62.

ETHER (SULPHUR)—

Jaffa, 1 cs., £7.

ETHYL CHLORIDE—

Calcutta, 1 cs., £16.

FATTY ACIDS—

Dunkirk, £50.

FORMIC ACID—

Cape Town, 1 brl., £11.

GELATINE—

Kilindini, 5 c.

GLUE—

New York, 2 t.

GLUE, SIZE, AND GELATINE—

Adelaide, 3 c.; Antwerp, 3 t. 15 c.; Alexandria, 5 t.; Archangel, 1 t. 10 c.; Batoum, 1 c.; Barcelona, 2 t. 18 c.; Bombay, 4 c.; Brisbane, 17 c.; Casablanca, 1 t.; Dieppe, 1 t. 3 c.; Pt. Said, 1 c.; Shanghai, 5 c.

GLYCERINE—

Alexandria, 7 c., £57.; Amoy, 4 c., £33.; Athens, 1 t. 10 c., £195.; Bombay, 7 c., £97.; Calcutta, 11 c., £117.; Canton, 3 c., £25.; Constantinople, 1 t., £138.; Durban, 11 c., £64.; Jaffa, 2 c., £17.; Paris, 10 t. 16 c., £1,370.; Rangoon, 1 c., £7.; Rouen, 2 t., £300.; Seville, 2 c., £19.

HYDROBROMIC ACID—

Rotterdam, 1 cs. (pt.), £5.

HYDROGEN PEROXIDE—

Alexandria, 3 cs. (pt.), £6.; Bombay, 2 cs., £12.; Cape Town, 2 cs. (pt.), £13.; Durban, 2 cs., £12.; Pt. Elizabeth, 2 cs., £13.; Tangier, 2 cs., £13.

IODINE—

Antwerp, 1 cs., £90.

IODINE (RESUBLIMED)—

Amsterdam, 1 t. (pt.), £45.; Batoum, 1 t. (pt.), £12.; Constantinople, 4 t., £395.

IODIFORM—

Karachi, 1 cs. (pt.), £8.

IRON AND AMMONIUM CITRATE

Amsterdam, 1 cs., £20.; Batavia, 1 cs. (pt.), £9.; Dunedin, 1 cs. (pt.), £7.; Melbourne, 4 cs. (pt.), £25.; Rangoon, 2 cs., £20.; Rotterdam, 2 cs., £62.; Soerabaya, 4 cs., £60.; Shanghai, 1 cs. (pt.), £9.

IRON PERCHLORIDE—

Calcutta, 2 cs., £6.

IRON REDACTATE—

Trinidad, 1 cs. (pt.), £9.

LACTIC ACID—

Brussels, 13 c., £50.

LEAD ACETATE—

Antwerp (F.), 10 cks., £250.; Vancouver, 1 kg., £5.

- LEAD ARSENIATE**—
Durban, 7 pkgs., £9.
- LITHIUM CARBONATE**—
Naples, 1 cs., £44.
- LITHIUM CITRATE**—
New York (F.), 12 cks., £160.
- MAGNESIA (CALCINED)**—
Bombay, 6 cs., £47.; Cape Town, 2 cs., £6.; Pt. Said, 1 cs., £8.
- MAGNESIUM CARBONATE**—
Bombay, 1 cs., £6.; Bushire, 1 cs., £5.; Dunedin, 2 cs., £7.; Paris, 10 bgs., £100.; Sydney, 4 cs., £15.; Vancouver, 2 cs., £9.
- MAGNESIUM CITRATE**—
Lisbon, 1 t. 15 c., £370.
- MAGNESIUM SULPHATE**—
Aden, 2 c., £5.; Amoy, 4 c., £7.; Barbados, 8 c., £18.; Brisbane, 17 c., £36.; Bushire, 3 c., £9.; Casablanca, 5 c., £10.; Pt. Swettenham, 5 c., £10.; Vancouver, 6 c., £6.; Zanzibar, 6 c., £23.
- MANGANESE DIOXIDE**—
Genoa, 3 cks., £25.
- MERCURY CHLORIDE**—
Constantinople, 1 cs., £71.
- MERCURY OXIDE**—
Amsterdam, 10 cs., £679.
- MERCURY PERCHLORIDE**—
Rangoon, 4 cs., 1 cs. (pt.), £161.
- MERCURY SUBCHLORIDE**—
Bangkok, 1 cs. (pt.), £25.
- METHYL SALICYLATE**—
Antwerp, 1 dr., £18.; Athens, 2 cs., £22.
- NICKEL SALTS**—
Paris, 15 cs., £38.
- NITRIC ACID**—
Durban, 5 c., £32.
- OXALIC ACID**—
Alexandria, 2 kgs., £15.; Bombay, 1 c., £8.; Fremantle, 1 cs., £8.
- PARAFFIN WAX**—
Dieppe, 6 c.
- PEARL ASH**—
Fremantle, 1 ck., £14.
- PHOSPHORIC ACID**—
Calais, 5 crbys., £10.; Rangoon, 2 cs., £8.
- PHOSPHORUS**—
Rotterdam (F.), 2 cs., £70.; Wellington, 10 cs., £121.
- PLUMBAGO**—
Bombay, 2 c.; Christchurch, 7 c.; Lyttleton, 1 t.
- POTASSIUM ACETATE**—
Bombay, 1 cs. (pt.), £5.
- POTASSIUM BICARBONATE**—
Fremantle, 2 kgs., £15.; Madras, 1 cs. (pt.), £5.
- POTASSIUM BICHROMATE**—
Amsterdam, 1 ck., £51.
- POTASSIUM BROMIDE**—
Bombay, 5 cs., £88.; Madras, (F.), 1 cs. (pt.), £9.
- POTASSIUM CARBONATE**—
Brisbane, 1 cs., £15.
- POTASSIUM CHLORATE**—
Colombo, 1 c., £7.
- POTASSIUM CHLORIDE**—
Penang, 1 c., £19.
- POTASSIUM CITRATE**—
Shanghai, 1 cs. (pt.), £8.
- POTASSIUM CYANIDE**—
Canton, 3 c., £65.; Paris, 60 cs., £1,433.; Shanghai, 1 c., £20.
- POTASSIUM IODIDE**—
Dunedin, 1 cs. (pt.), £6.; Hobart, 1 cs. (pt.), £6.; Madras, 1 cs. (pt.), £5.; Maranham, 2 cs. (pt.), £164.; Shanghai, 7 cs. (pt.), £7.; Trinidad, 1 cs. (pt.), £14.; Tientsin, 6 cs. (pt.), £24.
- POTASSIUM PERMANGANATE**—
Bombay, 1 cs., £22.; Karachi, 1 cs. (pt.), £5.
- POTASSIUM PRUSSIAN**—
Alexandria, 2 brls., 1 kg., £55.
- POTASSIUM SULPHATE**—
Bombay, 1 cs., £10.
- PYROGALLIC ACID**—
Durban, 1 cs., £8.; Shanghai, 2 cs., £38.
- QUININE**—
Auckland, 224 ozs.; Bombay, 3,000 ozs.; Calcutta, 2,000 ozs.; Cyprus, 634 ozs.
- SALICYLIC ACID**—
Naples, 2 cs., £44.
- SALT**—
Beira, 19 c.; Colombo, 12 c.; Launceston, 6 t.; Mombasa, 2 t.
- SALTPETRE**—
Alicante, 1 t. 10 c., £97.; Antwerp, 5 c., £18.; Barcelona, 13 t. 10 c., £702.; East London, 9 c., £27.; Hankow, 1 c., £9.; Montreal, 10 c., £30.; Toronto, 1 t., £60.; Valencia, 7 t. 4 c., £406.
- SHEEP DIP**—
Cape Town, 1 t. 17 c., £50.
- SILVER NITRATE**—
Amsterdam, 1 cs. (pt.), £11.; Dunedin, 2 cs. (pt.), £16.; Shanghai, 1 cs. (pt.), £5.
- SOAP**—
Adelaide, 2 c.; Aden, 3 c.; Alexandria, 12 c.; Amsterdam, 1 t. 13 c.; Antwerp, 463 t. 8 c.; Archangel, 40 t. 5 c.; Antofagasta, 5 c.; Bangkok, 16 c.; Batavia, 6 c.; Bombay, 3 t. 3 c.; Bathurst, 2 c.; Belawan, 6 c.; Brisbane, 7 c.; Beira, 2 c.; Buenos Ayres, 15 c.; Calcutta, 1 t. 7 c.; Casablanca, 2 c.; Cape Town, 13 c.; Colombo, 1 c.; Christchurch, 1 c.; Delagoa Bay, 1 c.; Djibouti, 2 c.; Durban, 3 c.; Dunedin, 1 c.; East London, 1 c.; Ghent, 1 t. 3 c.; Hobart, 3 c.; Ipoh, 3 c.; Italy, 2 c.; Karachi, 6 c.; Kilindini, 1 c.; Launceston, 8 c.; Macassar, 1 c.; Malmo, 4 c.; Mazagan, 3 t. 8 c.; Malta, 10 c.; Mogador, 1 t. 3 c.; Mombasa, 6 c.; Monte Video, 12 c.; Montreal, 1 c.; Naples, 8 c.; New York, 1 t. 10 c.; Penang, 9 c.; Piraeus, 4 c.; Pt. Said, 1 t. 9 c.; Pt. Swettenham, 4 c.; Pt. Elizabeth, 1 c.; Rotterdam, 15 t. 11 c.; St. Helena, 1 c.; Singapore, 1 t. 1 c.; Soerabaya, 1 t. 5 c.; Smyrna, 19 c.; Stavanger, 3 c.; Stockholm, 7 c.; Sydney, 2 c.; Trondhjem, 4 t.
- SODA (CALCINED)**—
Havre, 3 cks., £6.
- SODA ASH**—
Rotterdam, 50 t., £393
- SODA CRYSTALS**—
Cyprus, 10 t., £60.; Rabat, 4 t. 1 c., £30.
- SODIUM ARSENIATE**—
Durban, 1 t. 18 c., £99.
- SODIUM BENZOATE**—
Athens, 2 cs., £26.; Calcutta 1 cs., £30.
- SODIUM BICARBONATE**—
Batavia, 1 t. 5 c., £30.; Bombay, 2 c., £5.; Brussels, 10 c., £19.; Constantinople, 3 c., £11.; Canton, 10 c., £8.; Switzerland, via Dieppe, 20 t., £300.; Durban, 6 c., £9.; East London, 10 c., £15.; Swatow, 5 c., £7.; Sydney, 6 c., £7.; Vancouver, 5 c., £10.
- SODIUM BISULPHATE**—
Soerabaya, 1 t., £30.
- SODIUM BISULPHITE**—
Antwerp, 15 c., £25.
- SODIUM BROMIDE**—
Bombay, 2 cs. (pt.), £18.; Hong Kong, 1 cs. (pt.), £8.; Madras (F.), 2 cs. (pt.), £5.
- SODIUM CITRATE**—
Madras, 1 cs. (pt.), £20.; Rangoon, 1 cs. (pt.), £7.
- SODIUM GLYCEROPHOSPHATE**—
Antwerp, 1 cs., £12.
- SODIUM IODIDE**—
Amsterdam, 1 cs. (pt.), £11.; Batoum, 1 cs. (pt.), £52.; Calcutta, 1 cs. (pt.), £5.
- SODIUM NITRATE**—
Bombay, 17 cks., £165.
- SODIUM PHOSPHATE**—
Barcelona, 5 t. 2 c., £136.; Brussels, 2 cs., £7.; Delagoa Bay, 10 t. 1 c., £316.
- SODIUM SALICYLATE**—
Adelaide, 1 cs. (pt.), £14.; Antwerp, 2 kgs., £28.; Bombay, 1 cs. (pt.), £8.; Athens, 2 cs., £25.; Naples, 1 cs. (pt.), £20.; Sydney, 1 cs. (pt.), £20.
- SODIUM SULPHATE (GLAUBER)**—
Barbados, 5 c., £7. SALTS—
- SODIUM SULPHIDE**—
Zanzibar, 3 cks., £26.
- SODIUM SULPHITE**—
Antwerp, 2 t. 10 c., £30.
- SODIUM TARTRATE**—
Amsterdam, 2 cs. (pt.), £10.; Brisbane, 2 cs. (pt.), £21.
- TARTRINE**—
Antwerp, 15 t.
- SULPHUR**—
Antwerp, 4 c., £6.; New York, 2 t. 14 c., £150.; Swatow, 1 c., £6.
- SULPHUR (BLACK)**—
Barcelona, 11 brls., £250.
- SULPHUR (FLOWERS)**—
Bordeaux, 48 t. 4 c., £1,397.; Cape Town, 8 t. 19 c., £250.
- SULPHURIC ACID**—
Batoum, 20 t., £345.; Rotterdam, 250 cks., £588.; Singapore, 1 t., £39.; Tarquah, 8 c., £9.
- TALLOW**—
Alexandria, 3 t. 6 c.
- TANNIC ACID**—
Fremantle (F.), 2 cs. (pt.), £12.; Madras (F.), 1 cs. (pt.), £6.
- TAR (STOCKHOLM)**—
Singapore, £119.
- TARTARIC ACID**—
Bombay, 1 c., £18.; Calcutta, 1 c., £21.; East London, 6 c., £127.; Karachi, 12 c. (F.), £211.; Montreal, 6 t. 10 c., £2,138.; Pt. Elizabeth, 3 c., £57.; Pt. Said, 1 c. (F.), £13.; Pt. Sudan, 1 cs. (F.), £9.; Rotterdam, 5 t., (F.), £1,750.; Shanghai, 1 c., £24.; Tangier, 1 c., £20.; Toronto, 1 t. 10 c., £481.
- TERPINE HYDRATE**—
Brussels, 1 cs. (pt.), £10.
- URANUM NITRATE**—
Madras, 1 cs. (pt.), £10.
- WAX**—
Malmo, 1 t. 11 c.; Malta, 11 c.
- WHITE LEAD**—
Antwerp, £805.; Auckland, £125.; Bombay, £247.; Calais, £250.; Casablanca, £65.; Durban, £101.; Melbourne, £120.; Pt. Elizabeth, £15.; Paris, £353.; Pernambuco, £17.; Rabat, £125.; Rangoon, £190.
- MANCHESTER.**
Week ending July 2.
- ALUM (LUMP)**—
Alexandria, 13 brls.
- ALUMINA SULPHATE**—
Antwerp, 60 cs.
- AMMONIA**—
Rouen, 30 drms.
- AMMONIUM CARBONATE**—
Aalesund, 30 pkgs.; Copenhagen, 60 kgs.; Trondhjem, 120 kgs.
- AMMONIUM CHLORIDE**—
Rouen, 19 cks.
- BORAX**—
Alexandria, 1 cs.; Newcastle, 14 brls.
- BORIC ACID**—
Newcastle, 5 kgs.
- CITROCHLORIC ACID**—
Melbourne 5 cs.
- COAL PRODUCTS (otherwise undes.)**—
Antwerp, £33.; Boston, £1,988.; Copenhagen, £75.; Melbourne, £2,852.; Philadelphia, £169.
- DYESTUFFS (otherwise undescribed)**—
Alexandria, 4 drms.
- GLYCERINE (DISTILLED)**—
Alexandria, 2 cs.
- MAGNESIUM BISULPHITE**—
Montreal, 11 cks.
- MAGNESIUM CHLORIDE**—
Rouen, 20 drms.
- MAGNESIUM SULPHATE**—
Rouen, 56 bgs.
- OLEINE**—
Antwerp, 51 brls.
- SALAMMONIAC**—
Alexandria, 60 cs.; Brisbane, 2 cks.
- SALT**—
Adelaide, 100 cs.
- SOADINE**—
Boston, 50 cks.
- SOAP**—
Alexandria, 180 bxs.; Antwerp, 310 cs.
- SODA ASH**—
Alexandria, 20 bgs.
- SODA CRYSTALS**—
Alexandria, 220 bgs.
- SODIUM BICARBONATE**—
Adelaide, 127 pkgs.; Alexandria, 50 bgs.
- SODIUM BICHROMATE**—
Wellington, 6 cs.
- SODIUM BISULPHITE**—
Havre, 70 pkgs.
- SODIUM HYDROSULPHITE**—
Philadelphia, 60 kgs.
- TANNIC ACID**—
Havre, 3 pkgs.
- TARTARIC ACID CRYSTALS**—
Montreal, 2 cks.
- WHITE LEAD**—
Quebec, 2,400 pkgs.
- MIDDLESBROUGH.**
Week ending July 5.
- COAL PRODUCTS**—
Benzole
Gothenburg, 110 t., £3,720.; Rotterdam, 29 t. 5 c., £705.
Naphthalene
Rotterdam, 8 t. 2 c., £190.
Pitch
Antwerp, 3,827 t. 16 c., £8,779.
- SODIUM SULPHIDE**—
Wellington, 23 t. 5 c., £1,270.
- NEWCASTLE-ON-TYNE**
Week ending July 5.
- CAUSTIC SODA**—
Narvik, 100 t. 2 c.
- CHROME ORE**—
Rotterdam, 387 t.
- COAL PRODUCTS**—
Pitch
Antwerp, 1,260 t.
- FERRO MANGANESE**—
Bergen, 5 t. 7 c.
- WHITE LEAD**—
Bergen, 6 c.
- N. & S. SHIELDS.**
Week ending July 5.
- NIL.**
- STOCKTON-ON-TEES.**
Week ending July 5.
- NIL.**
- SWANSEA.**
Week ending July 5.
- NICKEL SALTS**—
Genoa, 2 t., £100.; Gothenburg, 49 t. 16 c., £2,100.; Hankow, 5 t. 5 c., £1,000.
- OXALIC ACID**—
Genoa, 3 t., £400.
- ZINC OXIDE**—
Barcelona, 1 t. 6 c., £88.; Havre, 2 t. 2 c., £135.; Treport, 20 t., £1,600.

PRICES CURRENT.

THURSDAY, July 10, 1919.

PREPARED BY MESSRS. HIGGINBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified
The prices in different localities may vary.

Acids:—

		£	s.	d.
*Acetic 40% and 60%	per cwt.	32/-	&	48/-
* " Glacial	per ton	82	0	0
Arsenic, S.G. 2,000°	per ton	50	0	0
Boric Crystals	"	72	0	0
*Fluoric	per lb.	0	0	7
*Muriatic (Tower Salts), 28° Tw.	per carboy	0	6	6
*Nitric, 80° Tw.	per ton	31	10	0

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ...	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

NEW ARRANGEMENTS.

The "Chemical Trade Journal" will be published in future a day earlier.

SUBSCRIBERS to whom the Journal is posted direct will therefore receive it each week on Friday.

EDITORIAL NOTICES.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than Wednesday morning.

CURRENT TOPICS.

SOCIETY OF CHEMICAL INDUSTRY: ANNUAL MEETING.

IT is peculiarly fitting that this year's annual meeting of members of the Society of Chemical Industry, closely coinciding with the termination of the peace negotiations, should be held in London. It is equally appropriate that the gathering, after four years of incessant war strain unparalleled in the history of the chemical industry, should be one of, if not the, most successful held under the auspices of the Society. The magnitude of the task which British chemical science and industry have successfully accomplished, and the weight of the responsibility which they were called upon to bear, will probably never be revealed in full. Certainly what the public until now have been permitted to see of the achievements of the chemists and chemical manufacturers of this country have been but fragments of the whole. The presidential address of Professor Henry Louis does not lend itself to criticism, but it is none the less interesting on that account. He has set out to review some of the more prominent aspects of the activities of the chemical and allied industries since 1914, and though he makes no pretence of having covered by any means the whole field, he has served the valuable purpose of marshalling available facts and figures, and presenting them in connected form. Viewed retrospectively, the results, even to chemists themselves, are nothing less than amazing. That the value of these achievements has not been more widely appreciated is not altogether surprising. The necessary secrecy in which the operations have been carried on is, of course, one reason; but another, and one which very largely is inseparable from the work of the chemist, is, as Professor Louis pointed out, the absence of anything of a spectacular character attached to it. Dealing with the immediate future which lies before the British chemical industries, the President emphasised the importance of increased production in order to meet

successfully the competition of chemical manufacturers of other nations. This problem is uppermost in the minds of manufacturers, and has been for months, but few of them in the present state of things look upon it hopefully. Increased production, desirable as it is in the interests of all classes of the community, is not only being retarded by the unfathomable attitude of labour generally, but in many cases output per unit is actually on the decline. Allowance has been generously made for the "reaction from war strain" theory, and it is now time that labour recovered its mental balance. Until that recovery takes place, and labour becomes once more a reasonably reliable quantity, "reconstruction" will remain but a will-o'-the-wisp.

The proceedings of the Annual Meeting this year are noteworthy in that they include the first conference of the much-discussed Chemical Engineering Group of the Society, and also that instead of a lengthy list of papers each dealing with a separate branch of the chemical industry, the communications are now grouped, each group being the subject of a special conference, two of which proceed simultaneously. Thus the chief point which was urged upon the Council of the Society in support of the movement to form the Chemical Engineering Group has been unobtrusively applied in other directions with what we hope will prove to be beneficial results.

The Government and Trade.

THE resignation of Sir Arthur Steel-Maitland, head of the Department of Overseas Trade, is no surprise to the business world. The wonder is that it did not come before. It is less than two years since the old Board of Trade Commercial Intelligence Department was remodelled as the Department of Overseas Trade at the moment when there was an insistent demand for the formation of a Ministry of Commerce. There was strong criticism at the time for the simple reason that the reorganisation, though it seemed to achieve something, in terms of well-chosen phrases in Parliament, obviously had in it all the makings of a failure from the business point of view, in that it was not a complete department to deal with the trade of the country, both home and foreign. What happened was that the strong antipathy of the Foreign Office to have the control of the Consular Service taken out of its hands prevailed, and we were presented with an Overseas Trade Department tacked on to the Foreign Office, whose past record in dealing with foreign trade affairs is not a particularly happy one. The terms of the letter in which Sir Arthur Steel-Maitland sent in his resignation are sufficiently explicit, not to say blunt, to indicate at once that what was feared all along has happened. He said: "I do not know whether the Government is really in earnest as regards re-establishing our international trade (which I myself consider vital), but at least, so far as I am concerned, I cannot continue to take the responsibility for work under such conditions that I cannot develop it or indeed carry it on properly, and when I am hung up, as, for example, with the Consular and kindred services." There we have a vindication of the first criticisms of the scheme under which the Overseas Trade Department came into being. One of the prominent things which were promised in the early days of the war was a reorganisation of our Consular service, presumably in the direction of greater efficiency. It is evident that the methods which the Foreign Office have of effecting this change do not coincide with those of a business man like Sir Arthur Steel-Maitland, who was specially appointed to the post of head of the Depart-

ment of Overseas Trade for his business abilities, and we are not surprised that they do not. At the same time, the businesslike working of the Consular Service is surely antecedent to an improvement in our general trade organisation, the whole of which it has been for so long argued should be placed in the hands of a Ministry of Commerce. Some time ago, in the days of Sir Albert Stanley as President of the Board of Trade, we were told that the Board of Trade was to form the nucleus of a Ministry of Commerce, but apparently the old antagonism of the Foreign Office to being relieved of its inefficient handling of the Consular Service was immediately revived, because quite recently the fact was dragged to light through the medium of a question in the House of Commons that a committee had been appointed to inquire into the question of separating the Consular Service from the Foreign Office. What has happened is a full justification for the creation of the foreign trade organisations of such bodies as the Federation of British Industries, and we are not at all sure that British trade would not be all the better if its interests were left entirely in private hands, and there was no such thing as a Government department which was even supposed to watch over trade interests. Our trade has prospered in spite of that in the past, and the domestic quarrel between the Foreign Office and the Board of Trade is ample warning to British traders and commercial men not to rely for any assistance upon any Government department, which experience has shown to be more a hindrance than a help.

MONOCLINIC DOUBLE SELENATES OF THE COBALT GROUP.

AT a recent meeting of the Royal Society, Dr. A. E. H. Tutton, F.R.S., read a paper dealing with the four double selenates of the series $R_2M(SeO_4)_2 \cdot 6H_2O$, in which M is cobalt and R is potassium, rubidium, caesium, or ammonium. A complete crystallographic and physical investigation has been carried out on parallel lines to the work previously published concerning the magnesium, zinc, iron, and nickel groups, and to that concerning the completed analogous series of double sulphates. The results are in full accord with those derived from the previous investigations. It is an interesting fact, said the author, that while each group of four salts containing the same M-metal and the four respective alkali bases presents its own absolute values for the various constants, and displays its own idiosyncrasies and individuality, yet the relations of the four salts to each other invariably exhibit the same regularities, gradations, and numerical progressions, even to the most apparently insignificant details, each group thus affording an independent confirmation of the truth of the general conclusions.

Two dominant facts emerge—namely, (1) the progressive order of all the crystallographic and physical properties, following the progression of the atomic numbers (and, therefore, atomic weights) of the interchangeable alkali metals concerned, potassium, rubidium, and caesium; and (2) the almost perfect isostructure—that is, congruency, coincidence, and equality of dimension of the elementary cells of the monoclinic space-lattices—of the crystals of the ammonium and rubidium salts of the group. The progression with atomic number referred to under (1) is completely explained by the operation of Moseley's law, governing the progressive structural complexity of the atoms in accordance with the sequence of the atomic number.

PROPOSED FRENCH GOVERNMENT OIL MONOPOLY. —A Government Bill (No. 6312) was introduced into the French Chamber of Deputies last month to institute a complete Government monopoly in the purchase and importation of refined oils and petroleum spirit in France, Algeria, and the French Colonies, through the medium of a central office attached to the Ministry of Finance. Further measures are also foreshadowed dealing with the distribution of the monopolised products.

SOCIETY OF CHEMICAL INDUSTRY.

ANNUAL GENERAL MEETING.

THE annual general meeting of the Society of Chemical Industry was held in London on July 15, 16, and 17. Professor Henry Louis was in the chair.

WELCOME BY THE LORD MAYOR.

The opening meeting was held at the Mansion House on the morning of July 15, when the Society was welcomed by the Lord Mayor of London (Sir Horace Marshall).

The Lord Mayor said it was right that a special welcome should be given to the Society in the City of London, the great centre of commerce. Chemistry had sometimes been described as the handmaid of commerce, but he was not sure that it did not merit the title of mistress of commerce, for to-day there was hardly a thing that was bought or sold or that we needed in our daily life—from a postage stamp to the R 34—in the production of which the chemist did not have an important part. It was indeed a fortunate thing that at the outbreak of the war the Government were able, principally through the instrumentality of Lord Moulton, to enlist at once through the Society's organisation the services of highly trained chemists and chemical manufacturers for countering the war devices of our chief enemy in the field, and whilst he could not pretend to know all the chemical discoveries, or the full extent of the impetus to chemical research, due to the activity of the past five years, he did know that British chemists had risen illustriously to the occasion of our national need, and had done literally wonders. In paying this tribute, they must not overlook the benefits gained by the co-operation of the chemists of the Allied countries. He understood that there were now in London distinguished delegates from the chemical societies of our Allies. Happily, this alliance with us for the purposes of war was no longer required, yet the alliance continued. This was analagous to the position of the Allied countries themselves which joined together for the purpose of the war. The purpose of this union had now passed, but the bond of their union remained unweakened. It was a profound pleasure to him as Lord Mayor of the City of London to welcome the Society to the Mansion House, and he hoped that the deliberations of the meetings would be happy, harmonious, and good for the community.

The President, in thanking the Lord Mayor for his kind welcome, said it was no small honour to be received by the first magistrate of the first city in the world, and they thoroughly and keenly appreciated the honour that had been done to the Society. They had been feeling urgently the great need the country had for the closest possible association between technologists and men of science on the one side and the commercial side of our great industries. These had been too long divorced. We had unfortunately always put the business side before the technical side, and we thought more of the man—and incidentally paid more to the man—who sold the goods than the man who made them. That was in principle wrong, and those who were engaged on the technological side and the scientific side of technology were only too anxious to come into the closest possible touch with those who were on the commercial side of the great industries of the country. The fact that they had been welcomed by the Lord Mayor of London showed that the City of London reciprocated that feeling. When both parties felt that close co-operation was to the benefit of both they might be quite certain that that co-operation would be brought about and would be fruitful.

The Lord Mayor had truly said that the chemical industries of the country had been one of the greatest factors in winning the war; might he point out that chemistry and the allied sciences were necessarily going to be one of the leading factors in the reconstruction that must necessarily follow that war, and, unless science and scientific technology had the place in the thoughts of the country which it deserved, we should be placed in even greater difficulties than could be foreseen at the moment.

ANNUAL MEETING.

The minutes of the last annual general meeting were read and confirmed.

The President said the following telegram of congratulation would be sent by the Society of Chemical Industry to His Majesty the King:—

The members of the Society of Chemical Industry gathered at the Mansion House on the occasion of their first annual meeting in London since the commencement of the war send to your Most Gracious Majesty their sincere congratulations on the peace that has been secured by the great victory of your forces in conjunction with those of your Allies and their heartfelt wish that it may be followed by many years of prosperity and happiness.

Messrs. H. Talbot and J. H. West were appointed scrutineers for the ballot for new members of Council, and the President announced that the ballot was closed.

The annual report of the Council was then dealt with, and taken as read.

Report of Council.

The report of the Council for the year shows that the membership now consists of 5,263 members, compared with 4,826 last year. No fewer than 65 members of the Society have died during the year, including Sir William Crookes, F.R.S., O.M., who was president in 1913, and Sir Boverton Redwood, Bart., president from 1907 to 1908. Three members have died on active service.

The Council has nominated Mr. John Gray, of Bromborough, Cheshire, as president to succeed Professor Henry Louis, who has been nominated a vice-president. To the other vacancies caused by the retirement of four vice-presidents, Professor J. W. Cobb, Mr. E. V. Evans, and Dr. A. Reé have been nominated. Four ordinary members of Council retire, and eleven nominations were received.

The Council has appointed a committee consisting of Dr. Charles Carpenter, Mr. W. McD Mackey, and Dr. S. Miall to revise the Society's bye-laws. Reference is made to the formation of the Chemical Engineering Group, the membership of which is now about 500. An alteration has been made in the bye-laws whereby this group and similar subject groups which may be formed in the future will be duly represented. The Canadian Section has, with the approval of the Council, been reorganised, and branches of this section have now been formed at Toronto, Montreal, and Ottawa, and it is proposed to establish other branches in important centres.

The Council has learned with pleasure that the Grasselli Chemical Company has founded a gold medal to be awarded annually to a member of the New York Section for a thesis offering the most useful suggestions in applied chemistry.

The formation of the Inter-Allied Conference of Chemists is referred to. The committee of ten has arranged to hold meetings during the annual meeting of the Society. The report also referred to the report of the Empire Sugar Supply (Technical) Committee and the appointment of a committee to confer with other interested bodies on the question of the standardisation of chemical laboratory glassware, with a view to assisting the glass manufacturers in limiting the supply of various classes of apparatus to a certain number of standard sizes. That committee was formed on the suggestion of Dr. Morris Travers, F.R.S., at the last annual meeting. Mr. K. M. Chance has resigned, and a number of additional members have been appointed.

The draft scheme prepared by the General Committee of Chemical and Allied Societies on the question of publishing chemical bibliographies in the English language has been adopted.

The Council was represented at two conferences held by the Imperial Mineral Resources Bureau dealing with mineral resources and production.

The President proposed the adoption of the report. Mr. Robert Mond seconded. The report was then put to the meeting and adopted.

The Honorary Treasurer, in submitting the statement of accounts, said they would see from the figures that the Society had passed through a very difficult period financially. The expenses had mounted enormously, and the measures that had been taken to increase the revenue had not yet been fully felt. It was very fortunate that it was only in the last 18 months of the war that the Society really felt the war pinch. Had the difficulties occurred earlier, or had the war gone on for another year, the position would indeed have given

rise to grave anxiety, whereas at the moment he did not think it did. The net result, however, was that for the year 1918 there was an excess of expenditure over revenue of £3,145. 0s. 9d. He would like to mention the very great personal debt of gratitude which he owed to the Finance Committee.

The President formally moved the adoption of the statement of accounts.

Mr. C. S. Garland, in seconding, said that whilst it might not seem altogether satisfactory that there should be a deficit of over £3,000., he thought they were to be congratulated in these times that with an increase of subscription of only 40 per cent., the deficit was not greater.

The motion was put to the meeting and carried unanimously.

PRESIDENTIAL ADDRESS.

Professor Henry Louis then delivered his Presidential Address:—

When we look back upon what the British chemical industry was before the war and on what it has accomplished during these five strenuous years, some faint idea may be gained of what the chemist's share has been in the great conflict.

The consumption of sulphuric acid is very often taken as a standard of the progress of chemical industries in general. Before the war our annual consumption of 100 per cent. sulphuric acid was about one million tons per annum, of which 25,000 tons were oleum; at the close of the war it was about one and three-quarter millions, of which 310,000 tons were oleum. This increase is significant enough as it stands, but when it is remembered that over half of the former figure was absorbed in two manufactures—namely, superphosphates and sulphate of ammonia—while only about 30,000 tons were used in the manufacture of explosives, and consider further that during the war sulphuric acid was mainly used in producing explosives, it is easy to see how enormously the consumption of acid for the latter purpose must have increased, and how much chemical engineering must have done towards making that increase possible.

In a general review of the chemist's war work, it would seem almost inevitable to assign the first place to the production of explosives. At the outbreak of war our manufacture of explosives was practically confined to those used for mining and other industrial purposes. When the needs of war demanded explosives of every kind, and particularly high explosives in quantities hitherto unimagined, it was soon found that our position was a perilous one, owing to the fact that Germany had for many years before the war practically monopolised all organic chemical products. Five years ago we found ourselves with neither the plant nor the experience required to produce a whole range of indispensable substances such as trinitrotoluene, trinitroxyline, dinitrophenol, tetryl, synthetic phenol, acetone, etc. The immense amount of research and experiment needed before these manufactures could be successfully set going on the required scale of magnitude is difficult to conceive except by those actually engaged in the work. In the manufacture of T.N.T. entirely new methods had to be devised and worked out on the required manufacturing scale, and the requisite plant for its production designed and constructed. The demand for picric acid soon rose to about 1,000 tons per week; it had become evident at an early stage of the war that the supplies of coal-tar phenol would be far below our requirements, and other sources of supply had to be found. We had never made synthetic phenol in this country, and a vast amount of experimental work had to be done before its manufacture from benzene through benzene sulphonic acid could be successfully undertaken. Even with these developments, our production of explosives was less than half of our requirements; for shell filling alone no less than 220,000 tons of high explosives were needed for 1917. Here, again, the resourcefulness of our chemists came to the rescue by the invention of a new explosive, amatol, consisting of a mixture of T.N.T. with from two to four times its weight of ammonium nitrate. Again, the demand for huge quantities of ammonium nitrate for this and other purposes could no longer conveniently be met by the older methods of manufacture, and new and more direct methods of production were worked out. The production of propellants rose to 2,000 tons per week. The shortage of acetone necessitated the use of ether-alcohol as solvent to the extent of about three-fourths of the output. This change involved the use of a different nitro-cotton, and practically a new method of manufacture, in the course of which a very large proportion of the solvents used—acetone, ether, and alcohol—were recovered.

When war broke out, we may be said to have had no acetone manufactured in this country and to have relied ex-

clusively upon importation to cover our needs. There was a relatively small works in the Forest of Dean capable of carbonising about 80 tons of cordwood weekly. This works was first enlarged, and then a number of other works were started, until a total carbonising capacity of 1,400 tons per week was reached. Eventually calcium acetate of a purity of about 90 per cent. was prepared, the chief impurity being calcium carbonate. The best conditions for the decomposition of the acetate so as to get the maximum yield of acetone had further to be determined, it being ultimately found that it was necessary to maintain steadily a temperature of between 450° and 500° C. in the retorts. Even with all precautions, the acetone was not quite up to the desired high standard of purity, and an elaborate series of researches on its purification had to be undertaken, until finally a product was obtained that satisfactorily passed the required tests. Various other methods of producing acetone were developed, such as synthesis from alcohol, which was used on a considerable scale, and its production by the anaerobic fermentation of potato or maize starch. It is to be hoped that some, at any rate, of the plants devised for acetone production will be maintained in operation, and that the country will not be allowed to fall back into its previous dependent position for the supply of this important substance.

After referring to many other phases of chemical activity during the war—e.g., pharmaceutical and photographic chemicals, and work in connection with aircraft production, etc.,—Professor Louis said: The one great fact that emerges from this mass of detail is that our chemical industry has shown itself capable of sustaining successfully the fiercest and most strenuous competition that it has ever been called upon to face. Utterly unprepared for war conditions and apparently unsuited to war emergencies, it has shown itself more resourceful, more energetic, and more successful than any of us had dared to hope. I venture to submit to you that we could never have built up so rapidly this vast edifice of chemical industry if the foundations upon which we had to build had not been thoroughly sound. I see in these results a triumphal vindication of the thesis that I have more than once urged—namely, that in the teaching of science, and more particularly of scientific technology, we are quite on a par with any other nation.

One other reflection, and I have done: We beat Germany in war because of our superior productivity. What is true of the fierce clash of warfare is equally true of the less spectacular but no less severe competition of peace; if we are to hold what we have gained, if we are to maintain our leading place among the nations of the world, it can only be by maintaining our productive capacity and increasing our outputs. This is a task that cannot be accomplished by scientists and technologists alone, they can but devise and organise the methods by which the work is to be done, but they must call upon the body of workers of the country to execute them. We won the war by the huge outputs that our industries were able to produce; in this way, and in this way alone, can we hold what we have gained through the years of strenuous competition that unquestionably lie before us.

Mr. John Gray (president-elect), in proposing a hearty vote of thanks to the president, said they had listened to a very interesting address from him, in which he had given a resumé of the great part which the chemical industries had played during the struggle which we had recently passed through, and it was a right thing that we should all take stock of ourselves at times. Professor Louis had taken stock of what the chemical industries had done during the past five years, and he thought they would all agree with him that the result of that stocktaking was eminently satisfactory. We had now entered upon the great period of reconstruction, and during that period their activities, which had been so very marked during the last few years, must not be slackened nor cease, otherwise the outlook for the future would be very dark.

Mr. Evans seconded the proposal. As a member of the Council, he could speak as to the amount of work which Professor Louis had put into the affairs of the Society, and for these reasons he had very much pleasure in seconding the vote of thanks.

The vote of thanks having been given with acclamation.

The President said he could only thank them sincerely for the manner in which it had been received. He would not conceal the fact that the last two years' work as president of the Society had been distinctly hard, but it had been distinctly pleasurable. He thought the history of the chemical industries during the past five years would always remain as a brilliant patch in the records of the industries of the country.

The meeting then adjourned to the Connaught Rooms for luncheon by invitation of the London Section.

OFFICIAL LUNCHEON.

There was a large attendance of members, ladies, and visitors at the luncheon at the Connaught Rooms, at which Dr. Charles A. Keane was in the chair.

In proposing the toast of "The King,"

The Chairman said that for the first time in the history of the Society they had been honoured by the patronage of His Majesty the King on the occasion of an annual meeting. It was a tribute to their labours which would be appreciated by all, and they should welcome it and appreciate it as evidence of that greater claim that science was obtaining in the affairs of the nation.

M. Paul Kestner (president of the Société de Chimie Industrielle) proposed the toast of "The London Section of the Society of Chemical Industry."

Dr. Keane, replying, said it was at the time of the previous visit of M. Kestner to London that the first link in the chain of inter-Allied co-operation was forged, and he hoped it would form a true league of nations for the advancement of the interests of applied and pure chemistry.

Dr. E. F. Armstrong proposed the toast of "The Guests."

Dr. Charles L. Parsons (secretary to the American Chemical Society), replying to the toast, said he had been in England a week, and during that time he had come into contact with many things which could not but inspire American chemists. It had been a pleasure to him to hear the president's address that morning and to realise how parallel the problems which had been solved here were with those which had had to be solved in America. He regretted that the two countries had not come into contact sooner on some of these problems, because in many of them Americans had already worked out their own salvation. America having come into the war, however—he wished she had done so sooner.—it was his good fortune to come into contact with many chemists from Great Britain, France, and Italy, and he wished to say a word of tribute to their ability, their spirit, and the activity they showed as well as the help they gave. There was one thing they were striving to accomplish in America, and he thought they would succeed, and that was in bringing together those who were interested in pure science and those who were interested in applied science. They had convinced the applied science man that it paid him to keep up with modern chemistry; and they had convinced the pure science man that something might be gained if his science was made fruitful to mankind. The two were now working hand in hand.

M. Behan, speaking in French, also replied.

On Tuesday afternoon the Society met again in the Mansion House, the president being in the chair.

INTER-ALLIED CHEMICAL FEDERATION.

Sir William J. Pope, F.R.S. (chairman of the British Federal Council for Pure and Applied Science), in opening a discussion on the subject of inter-Allied chemical federation, to which a great deal of attention had been given in this and Allied countries during the past few years, said that federation called for the organisation of co-operative effort. A fairly comprehensive scheme for the co-ordination of scientific effort was at present in course of formation under the direction of an International Research Council. This body was the co-ordinating head of a series of organisations, each dealing with the international aspect of some specific branch of science. Amongst these the International Chemical Council represented our own subject. Each country concerned in the movement had either formed or was in the course of forming a National Research Council, which covered the national aspects of science and formed the organising head of the Councils representing the separate sciences. Our own Federal Council for Pure and Applied Chemistry would no doubt ultimately represent chemistry as a constituent committee of the British National Research Council. The Federal Council was composed of nominees of all the large societies in this country whose interests were concerned with the various branches of pure and applied chemistry. Whilst the precise terms of constitution of these various bodies were not yet defined, it would be seen that the draft scheme, now rapidly approaching completion, aimed at the organisation of a network of bodies, each representing one science in one country, and that each of these units is under the aegis of the National Research Council of its own country, and was in communication with the body representing its own science in other countries. Thus the British Federal Council for Chemistry came under

the British National Research Council, and was to be brought into communication with the corresponding foreign chemical councils by forming an integral part of the Inter-Allied Confederation of Chemical Societies or the International Chemical Council.

The events of the last few years had led to certain limitations in the scope of the International Research Council. The work of organisation was now proceeding between the Allied nations, enemy and neutral nations at present taking no part in the deliberations. The whole organisation was thus not international but inter-Allied. The Inter-Allied Conference on International Scientific Relations, held at the Royal Society's Rooms on October 9—11, 1918, had made a declaration with regard to enemy nations in this connection, and the ultimate entry of the Central Powers into the organisation would seem to be postponed indefinitely or at least until a new generation assumed the administration of scientific affairs. The possibility of the admission of neutral nations into such a confederation had led to much discussion, and presented difficulties, and the whole question called for free and candid discussion and the earnest attention of the International Research Council.

Discussing a few of the advantages to be derived from co-operation, he said that in chemistry there existed the utmost need for the publication of compendia in which were abstracted within a moderate compass all the essentials concerning any branch of our knowledge. If it were possible, whenever information was desired on the state of knowledge concerning any chemical subject, to turn to a book of reference with the certainty of finding all the necessary particulars recorded, it was obvious that the velocity of increase of chemical knowledge would be very greatly accelerated. Beilstein attempted to provide such a compendium of the preparative side of organic chemistry, and the invaluable character of his handbook led to its ultimate acquirement by the German Chemical Society. Friedlander's compilation and annotation of patents bearing on the coal-tar colour industry in part also filled a gap. The great fields of physical, inorganic, and technical chemistry had not yet been summarised and indexed with similar completeness. The establishment of an organisation for the compilation and publication of compendia covering the whole field of chemical knowledge naturally fell to an inter-Allied chemical federation. It was a huge task, and would call for the co-operative expenditure of vast amounts of effort and money. It was impossible to doubt, however, that its achievement would repay its cost manyfold in the stimulus which would result to chemical discovery.

Regarding the publication of abstracts of chemical literature, Professor Pope said that an Inter-Allied Chemical Council would not encounter great difficulty in selecting all the papers of permanent value which have been published hitherto and presenting them for fresh publication in a new journal. These essential contributions might be published in chronological order with cross-references. Such a publication should furnish a powerful stimulus to original work not only by placing all the past technical literature of permanent value in the hands of the chemist of moderate means, but by setting a standard for attainment which could not fail to raise the general level of original chemical research. If an organisation for the production of abstracts were in existence, together with an efficient system of indexing, the production of a compendium of knowledge on any branch of chemistry would involve little more than a condensed transcription from the index. The question of the language in which these abstracts should be printed might present some difficulty, but he thought the needs would be met if the simultaneous publication of collective chemical works in French and English was made.

Dr. Washburn said that before the war we were content to a large degree to depend upon Germany for the compilation of compendia of scientific literature. Since the war we had appreciated one of the great dangers of permitting Germany to undertake this great field of chemical effort, for it had been used as propaganda, in as much as the world had come to believe in many quarters that because of the voluminous nature of this chemical literature, chemistry was a German science. We appreciated now the necessity for taking over this important part of chemical work and carrying it out ourselves. It seemed to them in America that the most practical way of carrying out the bibliographic work which they had under consideration was not to attempt to finance and direct it from one central authority, such as an inter-Allied chemical union, but rather for the union to let out the field in regard to the different branches and to assign the

responsibility, financial and otherwise, for each of the undertakings to the different nations gathered together in the organisation. In carrying out the work each nation would make use of chemists and investigators wherever they might be in the world who were best qualified to deal with the different sections of the work undertaken.

Professor H. E. Armstrong, F.R.S., said he thought such a system as that indicated by Dr. Washburn would have greater advantages than he had suggested, both from the point of view of time and expense, if we only had the will to come together and work together.

Dr. Wynne thought we should have to recognise that the model which the German Chemical Society had put forward had been found to be the most convenient for the purpose of reference, and that was what was required in a compendia. It was essential to be able to find out whether the substance which was being investigated had already been investigated or whether they were dealing with a new substance. There was a great gap to be bridged, and unless we could produce some of these volumes quickly we should have to rely on German compendia once again.

Dr. T. M. Lowry said there was need for information as to stocks of uncommon chemical materials which would prevent many a research which at present had to be carried out for want of knowledge as to whether stocks were held or not.

Professor Armstrong said that matter was under consideration at the moment by the Federal Council.

A hearty vote of thanks was accorded Sir William Pope.

"SIR WILLIAM RAMSAY."

Professor C. Moureu (president of the Inter-Allied Council of Federations for Pure and Applied Chemistry), then gave a long lecture in French on "Sir William Ramsay," at the conclusion of which he was accorded a hearty vote of thanks.

CHEMICAL ENGINEERING GROUP.

On Wednesday, the Chemical Engineering Group held its first annual conference, as part of the annual meeting, at the Salter's Hall. The conference continued throughout the day, and Professor Louis, Dr. M. O. Forster, and Dr. Charles Carpenter took the chair at various times during the proceedings.

Professor Henry Louis, who opened the conference, said he hoped that the energy and activity with which the newly formed group was attacking its duties would galvanise some of the more lethargic, older, and staid sections into activities which they all hoped to see. The work of the conference came at a psychological moment, in that it dealt directly or indirectly with fuel economy, and all engineers were keenly alive to the importance of exercising the utmost economy in the use of fuel, both from the commercial and technical points of view. It had been said that coal in the past had been too cheap, and that we had not treated it with the respect it deserved; but he did not think that reproach would be uttered any more in the future. Not only were we faced with a great increase in the price of coal, which was not an unmixed evil, but we were face to face with a very serious diminution in the output, and that, on the contrary, was a matter of the utmost gravity. It was only quite recently that the public had been rudely awakened to the fact that our coal output was falling off, and what had happened was a vindication of the views expressed by many people when the Minimum Wage Act was introduced, for with every successive increase in the minimum wage there had been a corresponding diminution in output. The coal industry was the only one, he believed, which had a minimum wage definitely fixed, and it was the only one in which the output per man was steadily falling. He personally was convinced that our low output of coal was due to the high minimum wage, and whilst the position that whether a man liked to work or not existed, we should necessarily be faced with low production. It was, however, their duty to make the best of the conditions as they existed, and that be the output large or small, it was utilised to the best advantage. He therefore looked upon the work of the conference as of importance not only to the chemical industry, but to the nation at large.

M. Paul Kestner, president of the Société de Chimie Industrielle, also spoke in support of the president as to the value of the work before the Chemical Engineering Group, and recalled that it was in this country that he had always received more encouragement and support for his inventions than he had received in any other country.

The following paper was then read by Captain C. J. Goodwin:—

"WASTE-HEAT BOILERS AND PULVERISED FUEL IN CHEMICAL FACTORIES."

In introducing the paper, the author said that they had only to remember that many prominent members of the gas industry belonged to the Society, and to look at their work, to know that the gas industry would do its full share as regards economy in fuel utilisation; but could they say the same of the chemical industry generally, or of the rest of the chemical industry? It was a debatable point whether chemical factories before the war were using their fuel in such a way that, after allowing for all charges, and bearing in mind the total amount of plant and capital involved, the cost was the lowest possible in relation to output. In the past chemical factories had not done their best so much in the national interests as in their own individual interests, but he thought that in the future they would be judged by what they did in the national interest. Referring to the use of powdered fuel, he said that 11,000,000 tons were being burned annually in America, and it had to be taken into account as a serious factor in our coal situation.

The author divided his paper into two parts—the first dealing with waste-heat boilers, and the second with pulverised fuel. Whilst the waste heat of factory chimneys is often partly recovered in Green or other economisers, and for puddling and other metallurgical furnaces waste-heat boilers are being increasingly adopted, the heat from the exhausts of internal-combustion engines is frequently allowed to go to waste. In chemical factories the gases from lime kilns, fusion pots, roasting, reverberatory, and other furnaces is but rarely used. The gasworks and coke ovens are probably the principal users of fuel in the chemical industries, and the author records his surprise that so little has been done in the past to utilise fully the available heat in suitable cases. In gasworks coke is no longer a drug on the market, and steam is required for producers and various purposes. In these and in coke-oven plant working regeneratively the objection may be raised that if any more heat is taken out of the gases their temperature would be insufficient to maintain a proper draught. Induced draught, however, would overcome this objection, and, given suitable conditions for utilising the steam, waste-heat boilers should be quite remunerative after allowing for the power required to drive the fans. An illustration is given of a waste-heat boiler designed by the Bonecourt Waste Heat Boiler Company, Ltd., and ordered as a trial installation for a standard set of continuous vertical retorts working under natural draught. By the adjustment of the dampers the volume of gas passing through the boiler can be adjusted to correspond with working requirements. The gases enter the boiler at 700° C., and are purposely designed to leave it at 300° C., in order to leave sufficient draught in the chimney. A better utilisation of the gases would be possible by using induced draught. A boiler working with the waste gases from a single retort setting will give 500lb. of steam per hour at 100lb. pressure, so that a gasworks comprising, say, 60 retorts could raise 7,500lb. of steam per hour from and at 100° C., in return for a capital outlay of about £4,000., and with relatively small operating costs. When the enormous number of gas retorts, coke-ovens, and also future low-temperature distillation plants, are considered, it is evident, says the author, that waste-heat boilers should be increasingly adopted in such works, and in connection with the utilisation of the sensible heat in gases produced by the super-power stations and by-product works of the future. In chemical processes high steam pressure is the exception, and in many factories quantities of hot water are required or can be efficiently utilised. Waste-heat boilers are therefore particularly suitable for chemical factories.

Dealing with the combustion of pulverised fuel, the author states that this partakes more, perhaps, of the nature of chemical engineering than the subject of waste-heat boilers, and considerable data, together with some general considerations, are given. A special report on the subject was recently issued by the Fuel Research Board, in which the large amount of work done in America in connection with pulverised fuel is detailed as the result of a special visit by Mr. L. C. Harvey. [An experimental plant is now being erected in this country at the works of Sir William Beardmore and Co., Glasgow, and the results will be published as soon as available.—Ed., C.T.J.]

Dr. W. R. Ormandy said that whilst it was true that in the past and at the present time a great deal of fuel was being used uneconomically, there was at the same time

no possible prospect of being able to use it more economically. It was stated, for instance, that the efficiency of a glass-melting furnace was something of the order of 2 per cent., and that a very large proportion of the heat was radiated through the brickwork of the furnace; but if any attempt were made to stop that, the inevitable consequence would be the utter failure of the brickwork. Thus, although much was said about the waste of fuel, there was in many instances no immediate prospect of effecting a saving. It required careful examination to find out at what point it was worth while putting in induced draught; but if it made possible the use of fuel such as roofing shale, containing only 55 per cent. of combustible material, which it would be utterly impossible to use with the ordinary type of stoker, then the question should be seriously considered. There was at present very little experience in the use of powdered fuel, and it seemed to him that more information was required as to the type of fuel to be used.

Mr. L. C. Harvey said that having made an investigation of the use of powdered fuel in America last year, he was very much struck by the possibilities. The difficulties with the old types of pulverisers had now been overcome, and boilers fired with pulverised fuel were giving efficiencies of 75 to 85 per cent., the fuel being such as was not previously usable. Sir Auckland Geddes recently referred to the loss of 7d. per ton of coal delivered in London due to the loss of smalls. That was material suitable for pulverisation, and, generally speaking, there was a large quantity of small coal—almost dirt—left at the mines which could be used in this way. In the United States they were using the lowest class of anthracite washings, containing 5 per cent. of volatile matter and 30 per cent. of ash. We had been told that 18 million tons of coal were used in the mines annually, and that six million tons were distributed to the miners. He did not believe the latter could burn such a large quantity. However, the scope for economy in coal-mining plants was seen in the fact that he knew of one Lancashire boiler installation at a mine where only 3lb. of water were evaporated per pound of fuel. The objection often taken to installing pulverised fuel plant was that plant working on this system could not be seen in this country, notwithstanding that he had shown in many cases that considerable savings would be effected by its use. One of the deterrents to the use of pulverised fuel was the initial cost of the plant for pulverising, but that would soon be got over, because pulverised coal would probably soon be available to small consumers, and that would obviate the necessity for installing their own pulverising plant. The present position with regard to the price of coal made the use of pulverised fuel a very attractive proposition.

Captain F. S. Sinnatt said pulverised fuel ought to have a very great future. In Lancashire to-day material suitable for the purpose was being wasted every day. In one case practically the whole field was covered with cannel coal of an inferior quality, the quantity of ash being anything from 20 to 60 per cent. An attempt was made to use it during the war for low-temperature distillation, but it was not a complete success. On the other hand, although this material was very hard to break, it was extraordinarily easy to grind, and that brought him to his next point—viz., that a great deal more study was needed of the chemical characteristics of our coals. It was a curious fact that soft coal was extremely difficult to grind to the degree required for pulverisation, and that was a chemical problem which required study.

Mr. H. M. Ridge said that the use of waste-heat boilers must not be assumed to be a panacea for all evils. He was of the opinion that the best economy was obtained by restricting the heating use to the primary object which was desired. By using an excessive quantity of coal in a puddling furnace, by which an excessive quantity of waste gaseous products was produced, and then putting in a waste-heat boiler to recover the heat units in these products was not a primary object. They wanted to make the puddling furnace more efficient, and should not try to make steam in more than one operation if it could be helped. The waste-steam boiler was one way out of the difficulty, but it was a poor way, if something else could be done. In a case he had had to deal with, in which the operation necessitated the waste gases leaving the furnace at about 300° or 400° C., he had made arrangements, and reduced the fuel consumption, so that the temperature of the stack gases was about 250°, and he could not have obtained the same financial results by passing the hot gases in the first place into waste-heat boilers. That could be done either by preheating the secondary air or actually reducing the temperature. It was preferable to preheat the secondary air, and he had done the same thing in a number of installations

working on a comparatively small scale, and obtained a good efficiency. In one such case, using only a few tons of coal per 24 hours, the waste gases left the furnace at about 1,000° or 1,100°, and by preheating the secondary air to between 600° and 850° the reduction in the coal consumption was more than 50 per cent.

Captain Goodwin, replying to the discussion, said that whilst he did not argue that chemical factories should not look to the primary efficiency of their furnaces, what Mr. Ridge had suggested was not applicable in all cases. With regard to induced draught, mentioned by Dr. Ormandy in connection with the use of powdered coal, he would like to point out that in a powdered-coal furnace, if they got a decently designed waste-heat boiler, they did not require much extra draught in order to take the gases through, and he submitted that in order to get that small draught they did not require anything like the amount of power for the fans which Dr. Ormandy seemed to think was necessary. He agreed with nearly everything that Mr. Harvey had said. The fact that such high efficiencies as 75 to 85 per cent. could be obtained with furnaces using pulverised fuel was of very great importance. Mechanical stokers were really only efficient when working at their normal steaming rate, and there was nearly always difficulty when they were tried on any considerable overload. There ought to be some organisation which would collect the dust and smalls referred to by Mr. Harvey, and concentrate them at some central point in every large town.

A hearty vote of thanks was accorded the author at the conclusion of the discussion.

The following paper was then read by Mr. J. L. Hodgson:—

"DIFFERENTIAL PRESSURE METERS FOR MEASURING AIR, GAS, AND STEAM FLOWS."

This paper contains a summary of the more interesting features of the metering problems mentioned in the title. The differential pressure required to actuate the indicating or recording devices is obtained in the meters for which the author is responsible, either by means of a constriction placed in the pipe line, or by means of a special form of Pitot tube consisting of a cylindrical rod, at one end of which two pressure holes are bored, the one facing exactly upstream, and the other exactly downstream. These pressure holes are connected by means of suitable passages and pressure pipes to the indicator or recorder. The Pitot tube is inserted in the main so that the pressure holes are at the centre of the main.

From the point of view of the indicating or recording instrument, the Pitot tube has, in spite of its simplicity, two important defects: (a) On account of the low velocities found in air and gas mains, the differential pressure produced is usually very small; (b) owing to the fact that the maximum differential pressure produced depends on the maximum velocity in the pipe line, and that this varies in practice between very wide limits—e.g., 15ft. per second in a gas main to 300ft. per second in a main carrying superheated steam,—the indicating and recording instruments would, if the Pitot tube were used as the basis of the measurements, have to be designed to deal with the numerous maximum "heads" from the next minute upwards, or else the diameter of the pipe line would have to be altered at the point where the Pitot tube was inserted in order to obtain a reasonable uniformity in the maximum heads dealt with.

Because of these defects, the author has developed only one instrument for use with the Pitot tube; the differential pressure in all other cases being obtained by means of constrictions placed in the pipe line, which can be designed to give the differential pressure required by the instruments over a very large range of maximum velocities.

In addition to the above defects, the Pitot tube is much more dependent upon good upstream conditions than a constriction is.

The instrument developed for use with the Pitot tube is termed the curved tube manometer. It consists of a reservoir containing oil which is connected to the upstream pressure hole, and a curved tube so shaped that equal increments in the velocity past the Pitot tip will cause equal movements of the oil meniscus along its length, which is connected to the downstream pressure hole. The manometer is so designed that it can be supplied to work at any maximum head between 15 and 120mm. of oil. Owing to the equal-spacing scale, accurate readings can be taken down to 1/9th or 1/10th of the maximum flow.

A larger type of the same instrument is now being developed in connection with high-pressure gas distribution, which will

enable accurate readings to be taken down to 1/20th of the maximum flow.

The Chairman (Dr. M. O. Forster) said there was plenty of scope for discussion on this paper, but in justice to the next author, Dr. Bone, he would ask that those who desired to discuss it would send in their contributions in writing.

A vote of thanks was accorded Mr. Hodgson for his paper.

A paper by Professor W. A. Bone and Mr. P. St. G. Kirke was communicated by the former.

"RECENT DEVELOPMENTS IN SURFACE COMBUSTION-BOILERS."

Professor Bone said he proposed to give a review of the development of a subject in which personally he was a good deal interested, but which had been mainly worked at during the last two or three years by Mr. Kirke. He proposed first to review the investigation as a whole, and then to mention some developments which had taken place since the Bonecourt system of surface combustion was first introduced.

He explained the characteristics of the Bonecourt system whereby an explosive gaseous mixture is forced on to an incandescent solid. As is now well known, the early experiments and practical application of the system used tubes 3ft. long and 3in. diameter packed with a loose granular material. The first experimental boiler was made up of ten such tubes fixed horizontally in a cylindrical steel shell, and it gave an efficiency of 94.3 per cent. In 1911 a much larger plant was erected at the Skinningrove Ironworks, the boiler being 4ft. long and 10ft. diameter, and containing 110 tubes. Two of these were ultimately put up, and they worked in conjunction with a feed-water heater. In July, 1912, these boilers, unlagged, gave an efficiency of 92.7 per cent. Certain difficulties were met with in this plant, but no trouble was experienced with the evaporating portion nor with the gas-feeding arrangements.

Dealing with the later modifications, Professor Bone pointed out that these had taken the form of lengthening the tubes, and first increasing and afterwards reducing again their size, and filling them by another form of refractory material. The latter had been adopted on account of objections which had been taken to the loose type of packing originally introduced, and which required renewal once a year, and, moreover, required to be very carefully packed. Consequently a rigid system of packing was introduced, consisting of moulded blocks placed at varying angles. The tubes were made 6in. in diameter instead of 3in. By the use of this form of packing they were able to use producer gas without any inconvenience, because with a closely packed tube such as that used originally it was impossible to pass a tar-laden gas through without clogging the packing. In this form the boilers could be used with producer gas or ammonia-recovery plants. The use of this rigid system of packing also had the effect of reducing the temperature of the packing in the front part of the boiler to about 850°. Two boilers fitted with these improvements had been put down in the Birmingham district in 1914 for generating steam from coke-oven producers, and had been working continuously ever since. These boilers were 10ft. diameter by 12ft. long, and contained each 38 tubes of 6in. diameter. With this rigid system of packing each tube was provided with its own gas supply, and although these two boilers had been running over five years none of the tubes had had to be renewed. The only criticism of the boiler was that they did not consider the separate supply of gas to each tube could be regarded as finality, and, further, that it would be an advantage if the tubes could be made of smaller diameter and of longer length, in order to increase the heating surface of the boiler. It was in one sense an advantage to have a separate gas supply to each tube, if the boiler was subject to variations in load. With a constant load, however, there was an advantage in dispensing altogether with the separate control, and a system had been devised for doing that. That consisted of a chamber through which the gas was supplied, which was controlled by a valve, and a perfect mixture for combustion could be maintained in the boiler tubes by adjusting the speed of the fan to the pressure so that the boiler could be fed at any desired load.

Another modification was that by the addition of a superheater the system could be made applicable to large power plants, which was impossible in the early stage of development. Experiments had been made, and results had been obtained which showed that with a boiler working at 100lb. pressure per square inch, the steam could be superheated to a tempera-

ture of 192° F., or a total temperature of 533° F., while at the same time the temperature of the products leaving the system were reduced to 442° F. Superheats of 340° were obtained on other experiments.

Further experiments had also been made with tubes of 3in. diameter and smaller, and of longer length, and a new form of iron spiral packing had been introduced with tubes of 2in. diameter. A Lancashire type of boiler had been constructed, 6ft. by 18ft., and containing 2in. tubes, fitted with superheater and feed-water heater, and using the spiral packing, the boiler being controlled by one valve for the gas supply to all the tubes. The efficiency of this was about the same as that of the original Skinningrove boiler.

The intention was, said Professor Bone, to build three types of boiler according to the circumstances in which they were to be used, the three types being the short boiler with loose packing and the other sizes of boiler and tubes with the two systems of solid packing referred to. The Skinningrove boiler, from the technical point of view, was quite good, but it was more costly to make for a given steam output than the later types, and, while he did not anticipate that users would wish to put in the more expensive type, if, for reasons of space, the short type of boiler was desired, they would be prepared to instal them and guarantee their successful operation and their high efficiency.

The paper was discussed in the afternoon, when Dr. Charles Carpenter presided.

Mr. H. J. Ping, of Hans Renold, Limited, said that he put down a Bonecourt boiler three years ago filled with solid spiral packing, and it had given great satisfaction, in addition to having many advantages in regard to coal supply, ash collection, space, and so on.

Dr. W. R. Ormandy asked what were the limits of the poor-ness of the gas which could be employed, and had it answered to use preheated air when using gas of a very low calorific value—say, 100B.Th.U.? He also asked whether the overall efficiency of a boiler run on producer gas would show any advantage over a direct-fired boiler run economically, unless the producer was able to use a low-grade fuel which could not be employed upon modern mechanical stokers. It was that aspect of affairs which was largely going to settle whether it would pay to instal this type of boiler.

Dr. Bone, in reply to Dr. Ormandy's question as to whether gases of low calorific value could be used, said he had already explained that he was working with ammonia-recovery plants, the gas being about 140B.Th.U. Possibly Dr. Ormandy referred to low-grade blast-furnace gas. Very soon after the earliest experiments he made some experiments at the Skinningrove works with boiler tubes on blast-furnace gas, and found that he could not get the surfaces to glow sufficiently by feeding in that gas with the proper proportion of air. He afterwards started the tubes with a little coke-oven gas in order to get the material in the tube to a sufficient state of glow, and then turned on the gas and air mixture. Then the tubes worked quite satisfactorily. As to the question of putting down a boiler for blast-furnace gas in preference to a steam-generating plant, he would be quite frank and say that the blast-furnace gas would have to be cleaned before it could be used in any form of this boiler, and if the gas had to be cleaned he thought they would get greater efficiency by putting it straight into an internal combustion engine than into any boiler system. There might, however, be cases where the employment of internal combustion engines and blast-furnace gas would not be desirable, and in that case he thought there would be no difficulty if the gas was cleaned—say, by the electrostatic method—of using it on the same lines as they used producer gas.

The Chairman, in proposing a vote of thanks to the authors, said they had proved that if they wanted to convert heat into steam it could be done economically by the method they proposed, always assuming that the source of heat—viz., gas—could be supplied under economical conditions. One of the advantages of the boiler was that it could be switched in or cut very much like a motor. It had been suggested that unless there was an independent supply of gas, and if the boiler had to be incorporated with the unit for generating gas, they were face to face with stand-by losses; but the most that could be said with regard to that was that the stand-by losses of a producer would not be anything like the stand-by losses in the case of an internally or Babcock fired boiler. In other words, they had a very much greater control over the production of gas in a producer than was possible in handling the dampers of the ordinary form of boiler.

The next paper was by Mr. P. Parrish on:—

"A MODERN CHEMICAL WORKS POWER PLANT."

The author of this paper is in charge of a chemical works operating in conjunction with a gasworks (the South Metropolitan), and consequently large quantities of coke are available, which, after grading and screening, leave a large supply of coke breeze. At one time the disposal of this latter was a matter of some difficulty, but the progressively increasing price of fuel of late years has compelled attention to its disposal. The major portion of the prime mover at the works under review is required in connection with plant for (1) disengaging ammonia from ammoniacal liquor, which is treated in continuous column stills, the gaseous ammonia being absorbed in such a way as to produce liquor ammonia, ammonium sulphate, sulphite, chloride, and polysulphide; (2) providing the formation of sulphuric acid in the chamber process. Approximately 1,000 tons of gas liquor are treated per day, and about 75 tons of chamber acid are made per day. Other chemical processes are conducted, but those named are the most important.

Whilst the production of steam, which offers the only choice for disengaging ammonia from ammoniacal liquor, from low-grade fuel is not a new one, it can hardly be said that finality in the matter of efficiency has been reached. Coke breeze is a very indefinite term, and according to a table in the paper the ash and moisture contents of that which the author has to deal with vary considerably. Crosthwaite furnaces are used for the combustion of this material, which, in common with most other furnaces of a like character, consist of a series of cast-iron air tubes, built up of sections. Each section is provided with serrations, or is so arranged that a section forms a series of perforations with abutting sections. A blank end section is provided with each furnace, so that the air for combustion of the fuel passes through the several serrations or perforations formed by the various sections when assembled. The air for combustion is delivered through the air tubes under pressure, and is induced by the passage of steam usually at boiler pressure through suitable jets or nozzles. In the case of the Crosthwaite furnace these nozzles have an orifice $\frac{3}{8}$ in. in diameter. Recent improvements in the design of the furnace appear to have been directed to the number and size of the holes for the admission of the primary air, with minimum dust percolation, to the blast pressure, as well as to the provision of a secondary supply of air, these factors tending to a greater uniformity in the distribution and utilisation of the air.

The paper discussed some practical points arising in the working of these furnaces, and among other details called attention to the fact that the grate as occasionally installed by the forced-draught specialists is too long to admit of maximum thermal efficiency. By reducing the length of the grate by about 20 per cent., the temperature of the waste gases was reduced by 310°C. to 240°C. , a lesser quantity of fuel was consumed, the capacity of the boilers was unimpaired, and the chimney draught was not prejudicially affected.

Attention is also called to the lack of any attempt in a chemical works with sulphuric acid and sulphate of ammonia plants to utilise the exhaust steam, and, further, the several pumps and small power units are usually scattered and situated in the midst of operations which are far from clean. The author strongly favours centralisation of power plant.

Mr. J. H. West said he had had experience six years ago of burning coke breeze under a battery of six Lancashire boilers in a chemical works, and he was able to make comparative tests with another plant of four Lancashire boilers burning bitumen slack through underfeed stokers. The two works were making the same products, and he could confirm all that the author had said as regards the figures of cost. The cost of the coke breeze delivered alongside was 6s. 3d., whilst the coal in the other works cost 13s. 3d. For the production of a ton of steam the fuel cost in the case of breeze was 13d., whilst in the case of coal it was 20.5d.; the respective labour costs being 8d. and 6d. The great difficulty in the use of breeze was the choking of the side flues, the dust very often being 2ft. thick. He adopted the system of cleaning out one fire at a time on each boiler, and that meant there was always a fire door open. He had tried to reduce the primary air, but that was apt to result not only in incomplete combustion, but it gave the risk of unburnt carbon monoxide passing into the main flue and causing explosions. The difficulty was got over by increasing the primary air to a proper figure. These explosions were particularly liable to happen if any of the fires were banked owing to a temporary decrease in the demand for steam, as carbon monoxide was then apt to be

formed. In such cases he left the fire doors a little bit open. It was, of course, in favour of coke breeze that it was cheap, and not so long ago was difficult to get rid of. Some of them had been on a good thing, but he had no doubt that if the gas companies found there was a new use for it they would put up the price. Finally, he mentioned that boilers burning breeze could not be forced to any extent if there was an emergency demand for steam; it was very difficult to get more out of them, and if they did it was at the expense of the efficiency.

The Chairman said he imagined that the speaker's last remarks referred to the use of breeze in a Lancashire boiler. If so, he agreed with what he had said, because he had always regarded it as a barbarous practice to raise steam in that way. It was one of the worst forms of furnace they could have. Using the Babcock or Stirling type of boiler, however, such as was commonly used in power stations, it had been found that a breeze containing a certain proportion of larger coke gave results as regards output from the boiler very nearly equal to those obtained when using coal.

Mr. H. M. Ridge said that if the author had been using excess of steam for blowing in the primary air—and he was not at all clear that that was the case,—it was a most undesirable thing, because not only did it give too much cooling, but with coke breeze a considerable proportion of water vapour which was not decomposed would pass through the incandescent coke, so that he would be losing heat at every stage. He was afraid that he was unable to agree with the author's limit to which it was essential to reduce the gas velocity in mechanical burners. That depended to a very great extent on the detailed design, and working with a much finer material than pyrites fines—90 per cent. to go through a 40 mesh—it was possible to use a higher gas velocity without having an appreciable quantity of dust carried forward.

Dr. W. R. Ormandy asked whether the experiments were carried out on a Lancashire boiler. He presumed they were, because the author spoke of the difficulty, in using coke, of the deadness with which it lay on the fire grates. That pointed to the requirement of some form of moving bar, and he believed a fire grate had been made—he had not seen a description of it published yet—of the moving-bar type as employed generally in the Babcock boiler, and working with forced draught. He would like to know whether with vertical gas retorts of the Glover-West type, in which steaming was employed, the water-gas manufacture which took place in the lower or hot portion of the layer of coke, led to the separation of ash, particularly on the outside of the coke particles; and did it result in the removal of a very considerable proportion of the ash. With regard to the utilisation of jets, it was essential to have a standard plug to test the size of the holes, because they very rapidly enlarged.

The Chairman, speaking with regard to the explosions in the flues, said that arose from the fact that as the fire was banked there was a thick body of fuel, and the small body of air coming through was converted into carbon monoxide, and if there was not an adequate supply of secondary air an explosion generally occurred when the fire was opened.

Mr. Parrish, replying to the discussion, said he was quite certain that if the primary air was reduced, the incombustible matter must of necessity increase, and there must obviously be an explosive mixture. With regard to the point raised by Mr. Ridge, he could only assume that he had had no experience of the combustion of breeze in Lancashire boilers with forced-draught furnaces, or he would not have suggested that too much steam was being used. They could not burn breeze unless steam was used. It was impossible to burn breeze without a primary supply of a certain pressure, and the only way to get that was by using a certain quantity of steam. Mr. Ridge also raised the question of gas velocity in relation to mechanical burners, and suggested that his experience would lead him to believe that there was no necessity to reduce the velocity of the gas. He himself had had an experience of some twenty years in connection with all types, and his figure of 4 lineal feet per second applied not only to Norwegian pyrites fines, but also to Spanish pyrites fines, and it was necessary to have such a velocity if they were going to eliminate the last traces of dust to get a perfectly satisfactory Glover tower acid. In reply to Dr. Ormandy, the experiments were made on a Lancashire boiler. As to the suggestion of a moving grate, he had had the opportunity of inspecting an installation in which a moving grate was adopted for the combustion of coke breeze, and where induced draught under a pressure of about $\frac{1}{2}$ in. was used. The manager of that installation was perfectly frank,

and put the whole of his figures on the table, and he himself did the same, and he found that he himself was doing the better of the two. He had had no experience of whether steaming fuel in Glover-West retorts led to the separation of ash on the coke particles, but he should imagine that it did. As to jets, also mentioned by Dr. Ormandy, he had found that after twelve months the enlargement was very small; it all depended upon the material they were made of. His personal view about the scientific combustion of this material was that it should be burned outside Lancashire boilers in a type of producer involving three conditions—a modified type of step grate was required; the producer must be arranged in such a way that there was preheating of the low-grade fuel, which was essential; and the step grate should be such that the clinker could be removed almost automatically. If they could get preheating of the low-grade fuel, and fairly regular removal of the clinker, he was certain that this material could be used to advantage, and even much more economically than the figures furnished in the paper.

The Chairman, in expressing the thanks of the conference to the author, said he would be the last to suggest that he had put forward a scientific process, but he had described an economical method of raising steam, arising from the fact that the fuel he had was very low in price. He had really summed up the whole question in his last words, when he said that the breeze really should not be burned under a Lancashire boiler at all. It should be gasified externally by a producer properly designed for the purpose, and then lead the gas into a boiler of some such type as that described by Professor Bone. That was a subject which might occupy the brains of some of our young designers. A great deal of this low-grade fuel was produced all over the country in increasing quantities, because the coke which it was now more or less the fashion to produce was much more friable than the harder coke produced in the old-fashioned retort setting. He had always thought there was scope for a producer which would burn breeze; there certainly was increasing use for one to-day. With regard to the question of ash raised by Dr. Ormandy, he would like to say that the lower part of the vertical retort was very low in temperature. It was made of cast iron, and he could not imagine that there would be any difference in the ash content of the coke at its edge or extremity than there was in the middle. He imagined that the coke had been fairly broken down by the time it got to the lower part of the retort, otherwise he did not think the results would have been achieved, at any rate as regards ammonia production, that had been returned from time to time in the Press.

A paper by Mr. H. Martin on "Electrical Supply in a Chemical Works" was taken as read, in the absence of the author, to whom a vote of thanks was accorded.

Professor J. W. Hinchley then gave his paper on:—

"THE OPERATION OF A CHEMICAL WORKS POWER PLANT."

It is easy to add accessories to boiler plant and make definite savings, and from a national point of view these are justified by a bare return, but in many cases it is possible, without any addition to the plant, to save the whole of the wages of the stokers by reasoning educational talk and by giving them a material benefit from their more efficient work.

The systematic chemical and physical examination of the fuel and the flue gases, the latter at different periods in the operation of the boilers, is not a difficult routine matter to establish even in a small chemical works; but unless the results are made intelligible and discussed between the stoker and the chemist no real improvement may be expected.

In all cases the stoker should be warned of the effect of leaky brickwork. The handling of the fire-door, the adjustment of the air supply above the fuel bed, and the closing of the door after firing, are matters upon which the chemist can guide the stoker with the authority of his analyses.

The problem is essentially one relating to "combustion" and "heat transmission." The former is best dealt with by the chemist in the manner mentioned, but the latter calls for careful measurement of coal, water, draught, temperature, etc., in more detail than the factory records usually give. The weighing of the coal used daily and the measurement of the feed water can usually be accomplished without difficulty.

The effect of heat transmission on the efficiency of boilers is of paramount importance, but the possible enormous variation of the rate of heat transmission is still hardly appreciated.

The outstanding importance of the heat transmission by radiation from the fuel bed should be insisted on. The stoker in firing should destroy as little as possible of the area of the

incandescent fuel bed. The length and shape of the firebrick bridge may be increased with advantage both to combustion and heat transmission.

The improvement of heat transmission on the fire side by increasing the velocity of the hot gases is usually not possible with the type of plant we are considering, although the reward is most attractive. The importance of the heat transmission on the water side of the boiler plate has not been adequately recognised in the past. The supply of fuel and water to the boiler should be made as continuous as possible to obtain the best conditions of heat transmission.

The formation of scale in the boiler during work has a most serious effect on heat transmission, and may reduce the capacity just before the cleaning period and occasion loss. The use of substances to prevent the formation of adhesive scale is generally advisable even with softened water. One of the latest of these materials, graphite, if used in the highest purity (85 per cent. carbon), is extremely effective. The general rule of the good stoker is to keep his fire in constant adjustment to the steam demand, maintaining it in such a condition at the lowest periods, so that by fully opening the damper he can obtain, in a few minutes, the maximum rate of combustion on the fire grate. At times of low demand the water level and steam pressure should be kept at their highest points, with the feed-pump working at its lowest rate. An increased demand for steam is shown by a drop in pressure and a fall in the water gauge. The opening of the damper and acceleration of combustion speedily equalise matters, and when the pressure ceases falling the feed-pump is accelerated to maintain the water level. A rise of pressure, on the other hand, would demand the closing of the damper somewhat, followed after a few minutes by a reduction of the speed of the feed-pump. Should the demand for steam over a period be such that, in spite of maximum combustion, the pressure falls too low for adequate service, some alteration or addition to the plant becomes essential. The grate may be increased in area (generally with reduction in efficiency), or a heat accumulator or a new boiler may be installed. On the other hand, the particular plant taking the sudden large supply of steam may be controlled to reduce its rate of working for the period of heavy steaming, without any loss.

A continuous feeding pump capable of continuous adjustment is essential to economy. As a rule, injectors should be removed. For boiler feeding they are inefficient through being intermittent.

The Chairman said that whatever might be the disadvantages of the present industrial conditions, we had got something on the other side—viz., much more intelligent workmen than we had 25 years ago. If a man who used to work twelve hours a day firing a boiler would now only work eight hours, there was a great possibility that a great deal of that extra expense might be recovered by getting him to do that eight-hour shift much more intelligently than was the case in days gone by.

A vote of thanks was accorded to Professor Hinchley.

The Chairman, in bringing the conference to a close, said he was sure that all those who were engaged in the chemical trade recognised the increasing importance of chemical engineering. He hoped the Group would be able to bring together those whose practice was mainly engineering and those whose practice was mainly chemical. That had been done very successfully in Germany, and there was no doubt that the position which the German chemical industry was in to-day, and was in before the war, was due very largely to the completeness of the collaboration between the chemist and the engineer. That was a work which the Chemical Engineering Group had set out to perform in this country, and he was glad that they had not fallen into the temptation to form a separate society from the mother society. In that they had shown foresight and statesmanship. The formation of the Group opened up great possibilities with regard to other branches of the chemical industry to form groups under the same flag. That would be of advantage in other ways, and in that respect the thanks of all those engaged in the chemical industry were due to the Chemical Engineering Group for the bold step they had taken, for the persistence with which they stuck to their point in face of a great deal of opposition, and, finally, for the success which had attained their first effort in the direction of the conference.

Professor Hinchley (Chairman of the Group), in proposing a hearty vote of thanks to Dr. Carpenter, said they all appreciated the encouragement which he had given to the movement from the beginning.

[A report of the further proceedings of the annual meeting will appear in our next issue. Ed., C.T.J.]

HIGH TEMPERATURE MEASUREMENTS IN THE PAINT AND VARNISH INDUSTRIES.

BEFORE the Oil and Colour Chemists' Association on July 10, Mr. R. S. Whipple read a paper on "High Temperature Measurement," in which he briefly reviewed various instruments which are in general use for the measurement of temperature, and gave the following summary of the practical conclusions.

In the laboratory, he said, nothing could exceed the convenience of the mercury-in-glass thermometer for temperatures up to 300 or even 400° C., but in the works it was an entirely different problem; the inconvenience of reading a thermometer, especially when in the hands of an unskilled workman, the risk of breakage, and the general inconvenience had to be considered. For temperatures up to 300° C., there was no more generally convenient thermometer than the mercury-in-steel, and he ventured to think there were great possibilities in front of this thermometer. It was impossible to place the unprotected steel tube in many of the pan mixtures, but if the stem was protected by means of lead covering—which could be done without difficulty,—then the instrument became an efficient and convenient tool. The dial part of the thermometer must naturally be made steam-tight in order that the moving parts might not be affected by moisture condensed in the interior of the instrument. As comparatively long capillaries might be used with these instruments, there was no difficulty in fixing the bulb into a vat, and the reading part of the instrument could be placed several feet away from it. The instrument could be placed in a position which was convenient for the man in charge of the operation.

In many processes, such as the manufacture of varnishes and in the preliminary preparation of linseed and other oils, it was necessary to measure temperatures up to 300° or 400° C. The conditions were frequently unsuitable for the employment of mercury thermometers, and either resistance or thermo-electric thermometers should be employed. If it was desired to take the temperature of a group of pans or vats it was generally advisable to instal a switchboard, so that any one of several thermometers could be read on the one galvanometer. If an open temperature scale was required, then a resistance thermometer should be employed, especially if the thermometer was to be kept untouched in the one position. If, however, the thermometer was to be taken in and out of the vessels continually it was preferable to use a thermo-couple. A couple was more robust than a resistance thermometer and was more easily renewed. If the thermometer was lead-protected and the connecting leads to the switchboard were carefully installed, then the thermometers would last without any attention for many years. Where a large number of thermometers were installed it was generally convenient to have arrangements made so that a recorder could be connected to any one thermometer through the switchboard. Thus, if it was desired to study the changes of temperature in one particular vat, the recorder was connected to the thermometer in that vat, whilst the temperatures of the other thermometers were read on the indicator without disturbing that one. If desired, the recorder or the indicator could be fitted with an electric alarm contact so that a bell would be rung when any given temperature was exceeded. Where higher temperatures were met with, such as from 800° to 1,000° C. in the manufacture of litharge and like products, thermo-couples should be employed. For temperatures not exceeding 900° C., some of the protected base metal thermo-couples, such as Hoskins nickel-chrome or the Titan couple, might be employed. For temperatures higher than 1,000° C., it was advisable to use platinum-rhodium couples. In the frict furnaces either radiation or optical pyrometers should be used.

The decision as to which type of pyrometer should be used depended very much on the class of labour working with the pyrometer. If the temperatures were to be read and not recorded, and if a fairly skilled observer was to use the instrument, then an optical pyrometer should be employed. If, on the other hand, an untrained observer was to take the temperatures, a Fery pyrometer, in which the readings were shown by a hand on a dial, should be used. The Fery instrument also had the advantage that a record of the temperatures could be taken without extreme difficulty.

In common with all other industries, paint and varnish manufacturers were now considering the advisability of reducing coal consumption. True economy could only be reached by seeing that every part of the steam plant was working to its full efficiency. One of the best guides for

knowing if a steam plant was working efficiently was knowledge of the temperatures throughout the plant. Electrical thermometers could be installed so that the engineer from his engine-room could know the temperature at the foot of his smoke-stack, at the inlet and outlet sides of his economiser, the temperature of his hot well, superheater, etc. From a knowledge of these temperatures he was able to form a very good idea of the efficiency of the plant.

The Chairman (Mr. A. Molteni) asked whether a thermo-couple containing aluminium would not be affected by the vapours in a lead furnace, or in a furnace where lead oxides were manufactured. It was the fact that whilst great progress had been made in temperature measurement in most industries, the paint and varnish trade still used the simple mercury-in-glass thermometer, perhaps because it was simple and also because of the cost of installing some of the more elaborate methods. Radiation pyrometers were not of much use to the trade, and it was unfortunate that there was not a simple mercury thermometer to measure up to 1,000°. He preferred the resistance thermometer to the thermo-couple, because it was possible for the records of the whole of a factory to be on a switchboard in the manager's office if it was desired. There was also the probability of working an electric alarm off such a system when a certain temperature had been reached, a useful device having regard to the various new oils that were being introduced into the varnish industry, which required much more careful temperature regulation than hitherto.

Mr. R. Britton said a system was wanted in the paint and varnish trade whereby the temperature measurements throughout the works could be read in the laboratory, because in some processes, at any rate, it was not felt that the operator could be trusted. It seemed that there were great possibilities of this with either the resistance thermometer or the thermo-couple. He did not altogether agree with the chairman that the industry had no use for the radiation pyrometer because it would be very useful in measuring the gloss of varnishes and comparing them.

Mr. E. S. Hanes said that on account of the unsatisfactory working of mercury thermometers his firm had adopted resistance thermometers with satisfactory results. He hoped shortly to have a switchboard by which he could get the temperature of the operations in any part of the works.

Mr. Whipple, in reply, said lead furnaces did have an effect as stated, but if the pyrometer was well protected it should last for some time. There was no difficulty in fitting an alarm, as suggested by Mr. Britton. He agreed with the suggestion that the radiation pyrometer could be used for comparing the gloss on varnish.

INSTITUTE OF PATENTEES.

A MEETING of the proposed Imperial Institute of Patentees, now in course of incorporation, was held at the Cannon Street Hotel, London, on Thursday of last week, under the auspices of the National Union of Manufacturers, for the purpose of considering and formulating a policy for the protection of the rights of patentees.

Sir Joseph Lawrence, who presided, said there had long been great need for a combination between inventors and patentees, and what was proposed now was, by means of this new Institute, to create an organisation which would enable patentees and patent owners to secure some amelioration of the conditions under which patents were worked. It would be an organisation which would represent hundreds of millions of capital and hundreds of thousands of people engaged in, or directly interested, in industries. Among other things, they proposed to ask the Government to give an extension of time to those patents which had been held up during the war, especially in the case of controlled firms. The period of extension which had been suggested was five years, that being the term of the war during which the patents had been held up. That was a definite object upon which the Institute might begin its work. The magnitude of the interests the Institute would represent might be inferred from the fact that during the three years preceding the war the number of patents sealed and of designs and trade marks registered were over 187,000.

The meeting agreed by resolution to the formation of an organisation "to safeguard and promote the interests of patentees," and pledged itself "to use all legitimate means to obtain from Parliament an extension of the life of patents which had been prevented from working and developing in consequence of the war," and further expressed the opinion

that "an alteration of the law was desirable in the interests of manufacturers and for the purposes of reconstruction." It was also decided that a deputation should present this resolution to the President of the Board of Trade.

THE ASSOCIATION OF BRITISH CHEMICAL MANUFACTURERS.

ANNUAL MEETING.

THE third annual meeting of the Association of British Chemical Manufacturers was held in the Council-room of the Chemical Society at Burlington House on Thursday (July 10), followed in the evening by a dinner at Prince's Hotel.

The Chairman, Mr. R. G. Perry, C.B.E., in his address at the annual meeting, reported a membership of 145 firms, representing a capital of about £70,000,000. In addition, seven kindred associations were affiliated to the Association. During the year much useful work had been accomplished in consolidating the industry and strengthening the position of its various branches. Much time had been devoted by the Council of the Association in impressing on the Government authorities not only the importance of an adequate supply of dyes, but the absolute necessity of new methods of stimulating dye production in this country, in order that it may be developed quickly and efficiently. It was not solely a question of obtaining dyes in large quantities, but much more a problem of variety and quality, as only a solution of these two factors would meet the wide requirements of our textile trade, and enable it to maintain its pre-eminent position in the world. We were only on the threshold of a great dye industry at home. The Association had been recognised by the Board of Trade, and Dr. A. Ree and the general manager, Mr. Woolcock, M.P., had acted as members of the Trade and Licensing Committee. In addition, Lord Moulton, the honorary president of the Association, had accepted the chairmanship of British Dyestuffs Corporation.

The importance of the manufacture of fine chemicals as a key industry had also been impressed on the Government, and the Association had been represented on an Imports and Exports Consultative Council, which was set up as a temporary measure. Close attention had been given by the Association to Parliamentary legislation in so far as it affected chemical industry, and particular mention might be made of patent law and traffic problems. A strong commission of the Association, representative of all branches of the industry, had recently returned from, and reported comprehensively upon, their visit, under Government auspices, to the chemical factories in the occupied area of Germany.

It was interesting to note that during the year an *entente cordiale* had been established between the British and French chemical industries, and collaboration between the two should be to their mutual advantage. After touching on many matters of domestic interest, the chairman stated that he was called upon to give evidence before the recent Coal Commission and to give his views on the control of the productive operations by public departments.

In the evening a distinguished and representative gathering dined at Prince's Hotel, and among the guests of the Association were: General Sir William Birdwood, Sir James J. Dobbie (president, Chemical Society), the Earl of Dunmore, V.C., D.S.O., Mr. T. G. Feasey, Lord Glenconner, General Hartley, Mr. J. Fitzallan Hope, M.P., Sir Herbert Jackson (president, Institute of Chemistry), Sir Evan Jones, Mr. F. G. Kellaway, M.P., Sir Arthur Steel Maitland, M.P., Rt. Hon. Sir Alfred Mond, Rt. Hon. Lord Moulton, and Mr. R. T. Nugent.

The toast to H.M. Ministers was proposed by Lord Moulton, and responded to by Sir Alfred Mond. Lord Moulton expressed his terror in the early days of the war at the lack of important chemical industries vitally necessary to save this country from defeat, and wondered to what extent the nation realised the importance of this industry.

In proposing the toast to the Association, Mr. Kellaway enlarged upon the remarkable achievements of British chemists and the wonderful part played by the industry as a whole. The toast was suitably responded to by Mr. Max Muspratt.

Dr. C. Carpenter, vice-president of the Association, proposed the toast to "Our Guests," which was responded to by the Earl of Dunmore and General Sir William Birdwood.

The toast to the Chairman was felicitously proposed by Sir William Pearce, M.P., and briefly responded to.

HELIUM.

REFERRING to recent developments in the production of helium in the course of a paper on "Science and Its Application to Marine Problems," read at the Victory Meeting of the North-East Coast Institution of Engineers and Shipbuilders at Newcastle-on-Tyne on July 10, Professor J. C. McLennan, O.B.E., F.R.S., Scientific Adviser to the Admiralty, said: Shortly after the commencement of the war it became evident that if helium were available in sufficient quantities to replace hydrogen in naval and military airships, the loss in life and equipment arising from the use of hydrogen would be enormously lessened. Helium is most suitable as a filling for airship envelopes, in that it is non-inflammable and non-explosive, and, if desired, the engines may be placed within the envelope. By its use it is possible to secure additional buoyancy by heating the gas (electrically or otherwise), and this fact might possibly lead to considerable modifications in the technique of airship manoeuvres and navigation. The loss of gas from diffusion through its envelope is less with helium than with hydrogen, but, on the other hand, the lifting power of helium is about 10 per cent. less than that of hydrogen.

Proposals have been frequently put forward by scientists in the British Empire and in enemy countries regarding the development of supplies of helium for airship purposes, but the first attempt to give practical effect to these proposals was initiated by Sir Richard Threlfall, who received strong support from the Admiralty through the Board of Invention and Research. It was known that supplies of natural gas containing helium, in varying amounts, existed in America, and it became evident from the preliminary investigations made by Sir Richard Threlfall and from calculations submitted by him as to the cost of production, transportation, etc., that there was substantial ground for believing that helium could be obtained in large quantities at a cost which would not be prohibitive.

The author was invited by the Board of Invention and Research in 1915 to determine the helium content of the supplies of natural gas within the Empire, to carry out a series of experiments on a semi-commercial scale with the helium supplies available, and also to work out all technical details in connection with the large scale production of helium and the large scale purification of such supplies as might be delivered, and become contaminated with air in service. In the course of these investigations, which were carried out with the co-operation of L'Air Liquide Company, it was found that large supplies of helium were available in Canada, which could be produced at a cost of about 1s. a cubic foot.

In the spring of 1917, when the United States had decided to enter the war on the side of the Allies, and after the investigations referred to above were well under way, proposals were made to the Navy and Air Board and to the National Research Council of the U.S.A. to co-operate by developing the supplies of helium available in the United States. The authorities cited agreed to co-operate with vigour in supporting these proposals, and large orders were at once placed by them with the Air Reduction Company and the Linde Company for plant, equipment, cylinders, etc. The Bureau of Mines also co-operated by taking steps to develop a new type of rectifying and purifying machine. By July, 1918, the production of helium in moderate quantities was accomplished, and from that time forward the possibility of securing large supplies of helium was assured. At the same time, under the direction of the author, plans were prepared and steps were taken to erect and equip a station for purifying the helium which might become contaminated in service.

Experimental investigations were also initiated with the object of developing all possible technical and scientific uses of helium. In particular, balance, spectroscopic and electrical methods of testing the purity of the gas were worked out, studies on the permeability of balloon fabrics to hydrogen and helium were commenced, and experiments were begun to exploit the use of helium in gas-filled incandescent lamps, gas-filled arc lamps, and in thermionic amplifying valves. The equipment provided for the purification of contaminated helium in large quantities supplied the major portion of the apparatus required to liquefy helium, and arrangements were therefore made to produce this gas in a liquid form for the purpose of carrying out low temperature researches.

The advances actually made at the time the armistice was signed warranted the opinion that by the present time, had the work projected been completed, supplies of helium at the rate of 2,000,000 cubic feet a month would have been produced within the Empire and the United States at a low cost.

SCIENTIFIC PRODUCTS EXHIBITION.

(Continued from page 35.)

EXHIBITS.

THE Mond Nickel Company, 39, Victoria Street, London, S.W., have an exhibit of nickel with a guaranteed purity of 99.8 per cent., prepared by the Mond process. Nickel sulphate in crystal powder is also shown, having particular catalytic properties in respect of the hydrogenation of oils. "Blighty" spraying mixture (Burgundy) should appeal just now that the season for spraying potatoes, etc., is on, inasmuch as it is arranged to eliminate the danger of scorching which so frequently occurs when inexperienced users make their own solution by dissolving copper sulphate and soda separately. It requires the addition of cold water only for its preparation.

The Hydronyl Syndicate, Ltd., 140, Leadenhall Street, London, E.C., have on view samples of fats hardened by hydrogenation according to Dr. R. Lessing's nickel carbonyl process. This is the only method of commercial hydrogenation in which the catalyst is not mixed with the oil in solid form, but is supplied as a vapour carried by the hydrogen gas employed. As fresh nickel is continuously added, the question of catalyst poisoning does not arise. Recovered nickel can be converted into nickel carbonyl directly without any intermediate conversion into a nickel salt. Samples of neutral sulphate of ammonia are exhibited obtained by the Linder-Lessing neutralising process, which has been adopted by a number of gas companies.

An exhibit which calls for mention is that of the British Optical Instrument Manufacturers' Association, the membership of which consists of some 14 well-known glass and lens makers. The Association, of course, has been called into existence as a result of the trouble we experienced in the shortage of optical lenses for gun-sights, pyrometers, microscopes, etc. It is curious that so many people—and we can hardly condemn them for it—are of the opinion that Germany, and not Great Britain, was the home of the optical industry. The optical instrument industry, however, originated in most of its branches in Great Britain, as did so many other branches of scientific work later developed by the Germans. To counteract the impression referred to, the British Optical Instrument Manufacturers' Association are about to publish an illustrated dictionary of scientific instruments, which includes, with a very brief description, the name of every known instrument, both current and obsolete, together with a key to the British makers of such as are now being used. If the size of the British optical factories has not equalled that of some of the Continental firms, the explanation—to a large extent, at any rate—may be found in the fact that Great Britain has not hitherto maintained an enormous standing army which required a vast optical equipment.

The Bellingham and Stanley refractometers, exhibited by Bellingham and Stanley, Ltd., 71, Hornsey Road, London, N. 19, are an echo of the recent meetings of the London Section of the Society of Chemical Industry, when the whole question of refractometry was discussed. We now have an improved type of Abbé refractometer made by this firm. This instrument possesses so many improvements that determinations of refractive indices (to an average accuracy of two units in the fourth decimal place) by day or artificial light can be made in one half the time required by the German type of instrument, which up to the present has been used throughout the world. The refractive index N_D of any transparent liquid, plastic or solid body, can readily be obtained by direct reading on the scale to the third; and by estimation to the fourth, decimal place, no calculation being necessary. The partial dispersion, C_F , of the material under examination can be obtained by referring the reading of the dispersion circle (situated below the telescope) to tables supplied with the instrument. A refractometer for testing butters, fats, and oils is similar in construction to the Abbé refractometer, and is designed to work between 1.42 and 1.49 N_D by day or artificial light. The Bellingham and Stanley immersion refractometer, with interchangeable prism, has been designed to measure refractive indices over a smaller range, but to a higher degree of accuracy than is possible with the Abbé type of instrument, so as to allow of the refractometers being applied to the accurate determination of the strengths of solutions.

In the metallurgy section there is much of interest to the chemical engineers. Cookson and Co., Ltd., Newcastle-on-Tyne, have samples of lead of exceptional purity (over 99.99 per cent.), the particular examples being super-refined sheet lead and lead pipe, having maximum acid-resisting properties.

Examples of litharge—a very large proportion of our requirements of which was supplied by Germany—and samples of orange lead also figure on this stand. Practically all the five orange lead also figure on this stand. Practically all the fine many and Austria, and no English makers could supply the requisite brilliant shades, fine textures, and chemical properties required. All that is now altered. Refined antimony can also be seen, the many uses of which are well known in the trade.

Johnson, Matthey and Co., Ltd., of 73-82, Hatton Garden, London, and also Manchester, have a case exhibiting specimens of the metals and various salts of gold, silver, platinum and metals of the platinum group, bismuth, selenium, tellurium, thorium, tungsten, niobium, thallium, etc., showing the connection of the firm with these metals in the past and some of their latest developments and applications.

A few exhibits are classified in the Fuel Section, and perhaps the most important, in view of recent events, is that of the Geographical Survey, which consists of mineral oil, oil shale, cannel coal, lignite, bitumen, etc., found in Great Britain. It is common knowledge that borings for oil were commenced in this country in October, 1918, a sum of £1,000,000, having been appropriated by the Government for the purpose, and Messrs. S. Pearson and Son, Ltd., were appointed to carry out the work under the title of Petroleum Development Managers. The first boring, at Hardstoft, near Chesterfield, was inaugurated on October 15, and since then six other borings have been commenced in the same county, two in Staffordshire and two in Scotland. The sites of all the borings are shown in the geographical map of the British Isles exhibited. The Survey also exhibits bauxitic clay from Salcoats, North Ayrshire, which, during the war, found a place as a high-grade refractory in the manufacture of small electric furnaces and crucibles, and also for glass-house use.

The Committee on the Production of Oil from Coal, Etc., shows raw materials, crude oils, and refined products to the extent of 50 samples of carbonaceous material from various deposits in Great Britain, including samples of lignite from Devonshire and shales from Scotland and Dorset.

LEAD-SODIUM ALLOYS.

IT has long been known that an addition of sodium to lead hardens the lead. As nearly the same effect can be obtained by the addition of other elements, however, which do not render the lead subject to corrosion as the sodium is apt to do, the lead-sodium alloys have little been studied. In the *Zeitschrift des Vereines Deutscher Ingenieure*, of May 10 last, Dr. J. Goebel describes some tests to which he submitted ternary alloys of lead-sodium-mercury and lead-sodium-tin. He started from the binary alloys Pb-Na, Pb-Hg, Pb, Sn, fusing the constituents in a hydrogen atmosphere, and cast test cylinders, 2cm. diameter, 1.75cm. high, which he submitted to hardness tests (Brinell), bending tests and impact tests. The specimens were tested immediately after quenching, or eight days or more later. Lead dissolves 0.8 per cent. of sodium, and the mixed crystals formed in the 4 per cent. alloy contain the compound Na_2Pb , the eutectic contains 2.5 per cent. of sodium. The addition of up to 7 per cent. of mercury to lead raises the hardness figure from 4 to 9. When sodium (up to 4 per cent.) is added to the lead, the hardness increases very much, reaching the value 8 when the Na percentage exceeds 0.8, keeping nearly at that value up to 2.5 per cent. and falling off with higher Na percentages. The hardness figure of zinc would, by the same test, be 27, that of electrolytic iron 47. The further addition of mercury to these binary alloys does not make much difference; the curves are in general more regular, however, and the maximum is shifted nearer 2.5 per cent. Na. Ternary alloys containing less than 1 per cent. of Na are softer than the corresponding Pb-Na alloys. The bending tests gave better values when mercury was added to the lead, and poorer values when sodium was added. The crushing tests showed that the reduction in height of the cylinder was much decreased by the addition of sodium, and the formation of cracks was also less noticeable; but hardness and crushing strength did not go together, and two specimens of equal hardness might give very different crushing values. The experiments with the binary and ternary tin alloys, Pb-Na-Sn, were not satisfactory; the sodium made the alloys (up to 7 per cent. of tin) harder, but not stronger, and the conclusion drawn is that only the lead sodium-mercury alloys might answer for certain technical purposes.—*Engineering*.

SCIENCE AND INDUSTRY.

LESSONS TO MANUFACTURERS FROM THE RHINE PROVINCES.

AT a largely attended and representative meeting of the National Union of Manufacturers, held on Monday, at the rooms of the Birmingham Chamber of Commerce—Mr. Randle L. Mathews presiding—Mr. Wilfrid Hill, chairman of the County Chemical Company, Limited, and the Calthorpe Motor Company, Limited, Birmingham, gave his "commercial reflections" on a recent visit to the Rhine provinces. His first reflection, he said, was one which naturally occurred, and inevitably, to a man like himself who was at once a chemist and a manufacturer—and it was that in the aniline dyeworks at Leverkusen he saw the world's greatest triumph in the application of chemical science to industry. In little more than a generation science had made Germany one of the most progressive industrial nations of the world.

Germany, Mr. Hill insisted, would in the future, as in the past, be one of our most formidable trade rivals, and, if we were to hold our own in the world's commerce, we must equip ourselves for the contest so as to meet our rivals on equal terms. That meant that we must yoke cosmopolitan science to British industry.

"I am convinced," he said, "that there are very few British factories of any considerable magnitude and importance in which the installation of a well-equipped laboratory and the employment of a competent chemist would not be a sound and profitable investment." The manufacturer's chemist would carefully inspect and analyse raw materials on their arrival, and so ensure that only ingredients of good quality entered into the composition of the finished article. This detective process would prevent three undesirable things: (a) Fraud on the part of those who supplied the materials; (b) disappointment and complaint on the part of the manufacturer's customers; and (c) loss of reputation and trade to the manufacturer himself. It would also be the duty of the chemist employed to revise the formulae used by the firm in the light of the latest scientific discoveries, thus from time to time improving the quality and lowering the cost of goods produced. Furthermore, it would be his province to test the finished products before despatch to make sure that neither accidental mistake nor deliberate neglect in the process of manufacture had led to the production of goods either above or below the standard of quality intended. Lastly, the chemist from his daily experience and as a result of his personal experiments would be able to suggest new lines, and so stimulate the firm's enterprise and expand its business.

His second reflection was that in the aniline dyeworks he had an illustration of Germany's genius for hard work. Those works were, while being a monument to Germany's commercial genius, the greatest reproach to Britain's short-sightedness. Science alone could not have made Germany a progressive and prosperous manufacturing people. Germany's prosperity was due to the fact that she was alike industrious and scientific. To-day commerce needed not only more science but more diligence—a greater enthusiasm for productive work.

One effect of the war, let us hope it was only temporary—seemed to be a sense of exhaustion and the creation of an almost universal disinclination for ordinary routine work. That spirit was very manifest in many British factories where there was a noticeable reluctance to put forth the best physical energy on the part of the workpeople. What was wanted in England to-day was a new basis of relationship between capital and labour; there must be a means whereby employer and employed may meet, reason, understand, and co-operate with one another. Modern industry must be democratised by the setting up of works committees and joint industrial councils. Real improvement in the standard of life could not be brought home by clamouring for shorter hours and higher pay; it could only be done by increased output; and, as a new basis of remuneration, something was necessary beyond the weekly wage and the piece-work rate—an attractive bonus on output.

Finally, the claims of science, of industrial chemistry, and engineering could scarcely be over-emphasised. Thirty years ago someone slumbered and blundered. Who was responsible for the loss of our nation's trade? Was it the British manufacturer of dyes or the British Government of that day? He was disposed to saddle both with the blame and the shame. Had the domestic dye industry been better organised, had there been closer co-operation between the makers and users of dyes in the textile and allied trades, and had those British producers and consumers been gifted with more foresight, the

trade necessity, for which there was bound to be a ready market in almost every market of the world, would never have been allowed to become the monopoly of an actual rival and a potential foe. (Applause.)

COAL CONSERVATION.

AT the British Scientific Products Exhibition on Friday, July 11, a lecture was given on this subject. Sir Robert Hadfield presided.

Professor H. E. Armstrong, F.R.S., in the course of his lecture, said the Sankey report mentioned not a word of the wasteful methods of burning coal which were now practised, nor as to the need of economics, but it had to be remembered that Socialism and not science was the governing factor in the situation with which Mr. Justice Sankey had to deal. It was impossible to over-rate the serious importance of the great rise in the cost of coal, but the position which had been brought about was largely due to the want of a national policy with regard to fuel and power. If attention was turned to improved methods of carbonising coal, our entire outlook would be changed. He believed the problem would be solved. During the past two years he had been a constant witness of experiments on a large scale—using several hundred tons of coal,—and the results had convinced him that it was merely a question of getting the engineering appliances which would make it economically possible to carbonise on a large scale. The coming struggle would be between smokeless solid fuel and gas as heating agents for domestic use. He did not believe that the proposed 16 electric-generating stations would serve the general needs of the country, although they might be made to serve the more important industrial centres. What was wanted was a scheme which would meet the general needs of the country, and that could only be obtained by the use of raw coal being disallowed and the coal carbonised and then distributed as a smokeless fuel. It would therefore be necessary to arrange for the fusion and consolidation of all interests concerned and to arrange power centres which would also be centres for the supply of smokeless fuel, as well as oil fuel and all the important by-products of carbonisation. In this way it would be possible to halve our coal bill at no very distant date.

Professor W. A. Bone said we were to-day reaping very largely what we had sown. Two generations of chemists at least, it might be said, had practically neglected the chemistry of coal. Before it would be possible to construct a sound and comprehensive policy with regard to coal it was necessary to investigate thoroughly the chemical characteristics of our coal seams, but although this had been advocated and set before the Government and the country, as yet he saw no signs of any attempt to carry out what he would call a chemical survey of the coalfields, and he was sure that the Department of Scientific and Industrial Research had not yet grasped what was meant by that.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

A rise of 6s. per ton in the price of coal, such as is contemplated by the Government, would hit the coking and chemical industries of West Cumberland almost immediately. The smelting of ordinary iron, for which the local coke (and not the harder East Coast coke) is used, would be quickly rendered unnecessary for the following reason: Workington to a very large extent keeps its steelworks going by the manufacture of steel rails, but it is already difficult to secure sufficient orders to maintain the plant in operation; and as every rise of 1s. in the price of coal means 8s. on the price of steel, American competition would oust West Coast railmakers out of the world's markets altogether. At present the demand for Cumberland coke no more than suffices to keep the ovens working at two-thirds of their capacity, and the export market is negligible.

The manufacture of by-products has diminished somewhat. Benzole continues to be in active demand, Ireland taking all the spirit that cannot be marketed locally. The entire make of sulphate of ammonia is being absorbed, though very little is going on export account. Pitch stocks have not all yet been cleared, but are moving away freely. Creosote is in fairly brisk request. Acids are weak, and some portion of the chemical works plant is idle.

ITEMS OF INTEREST.

RELAXATION OF SPANISH EXPORT EMBARGO ON OLIVE OIL.—The Spanish Government, it is said, will allow the exportation of 45,000,000 kilos. of olive oil during the second half of 1919.

MOTOR TRANSPORT.—The Chemical Employers' Federation has entered into an affiliation agreement with the Motor Transport Employers' Federation in respect of those of its members who employ commercial motor-vehicles.

BRUNNER, MOND AND CO. IN WESTERN AUSTRALIA.—Investigations of the resources of Western Australia have been recently carried out in that State on behalf of Messrs. Brunner, Mond and Co., with a view to establishing alkali works in Western Australia.

BRITISH DYESTUFFS CORPORATION.—We understand that the underwriting of 2,500,000 7 per cent preference and 2,500,000 preferred ordinary shares of the British Dyestuffs Corporation, Limited, was completed on Wednesday, and the prospectus will be issued on Monday next.

NOTIFICATION OF INDUSTRIAL ACCIDENTS.—At Halifax West Riding Police Court on Saturday last, Brookes Chemicals, Ltd., Lightcliffe, were fined £5. and costs for failing to notify the Inspector of Factories and Workshops of an accident which occurred at their works to one of their workmen.

INCREASED COST OF COAL TO THE CHEMICAL INDUSTRIES.—According to a statement issued by the Federation of British Industries, the proposed increase of 6s. per ton in the cost of coal will, in the aggregate, mean an increased expenditure by the chemical and allied industries of £1,363,500.

BUSINESS NOTICE.—Messrs. H. D. Hardie and Co., drysalters and merchants, 11-27, Bishop Street, Anderston, Glasgow, have concerted their business into a private limited company, with a capital of £100,000., under the title of H. D. Hardie and Co., Ltd. No change will take place in the management.

MANUFACTURE OF PHARMACEUTICAL CHEMICALS.—In a prefatory note to a memorandum just issued by the National Health Insurance Commissioners, Major Waldorf Astor, M.P., chairman, says: "It is not too much to say that the fine chemical industry has been greatly developed and extended, and that this country is now capable of manufacturing on a large scale all the important medicinal chemicals which before the war had been practically a German monopoly."

EXPORTS TO HOLLAND AND SWITZERLAND.—The Board of Trade (Export Licence Department) announce that in view of the raising of the blockade it is no longer necessary for goods exported to Holland and Switzerland to be consigned respectively to the Netherlands Oversea Trust and the Société Suisse de Surveillance Economique. Goods exported via Holland to the Occupied Rhineland Territory, Belgium, or Switzerland need not now be consigned to the Standard Bank of South Africa, Rotterdam.

ZINC AND ZINC DUST PRICES.—Australian high-grade zinc dust (88-92 per cent. metallic zinc purity) is quoted at £70. per ton, f.o.r. Consumers appear to be a little apprehensive of the quotation being raised in sympathy with the increase in the market price of spelter, but the Australian producers have made no move in this direction. The price of Australian electrolytic zinc (99.95 per cent. metallic zinc) has been advanced £2. to £42. per ton, f.o.b. Australia. Prompt business is on offer for shipment direct to New Zealand, India, South Africa, and elsewhere in the Far East.

TRADE WITH GERMANY AND GERMAN-AUSTRIA.—In view of the raising of the blockade, the Board of Trade have issued general licences under the trading with the enemy legislation authorising, with certain reservations, the resumption of trade with Germany and German-Austria. The licences do not remove the existing restrictions upon the payment of debts and the return of property due or deliverable to persons in Germany and German-Austria in respect of pre-war transactions. Moreover, any permission which may be necessary in respect of any transactions under Defence of the Realm Regulation 41D must be obtained from the Treasury. The licences do not permit the importation from Germany or German-Austria of any goods included in the Prohibition of Import Proclamations and not covered by a general licence issued under those Proclamations. Further, export licences must be obtained from the Export Licence Department, 1, Queen Anne's Gate, Westminster, S.W. 1, before goods included in Lists "A" and "B" of prohibited exports are shipped to those countries, but no licences are required in respect of goods included in List "C."

A CEMENT UNION.—The Associated Portland Cement Manufacturers and the British Portland Cement Manufacturers have resolved on joining forces by "a scheme of joint management, which will enable substantial reductions to be made in the number of directors and managing directors." The joint board will consist of a chairman, seven managing directors, and six representatives from each company, with the addition of Sir Guy Granet. An incidental reform will be the division of the £10. preference and ordinary shares of the Associated and the preference shares of the British into £1. shares.

PATRIOTIC STAND BY AUSTRALIAN CHEMISTS.—Some of the leading firms in Australia have taken a determined stand against the resumption of business relations with enemy trading concerns. The Australian firms of manufacturing chemists, Messrs. Felton, Grimwade and Co., of Melbourne, and Messrs. F. H. Faulding and Co., of Adelaide, recently received letters from Messrs. Schering and Glatz, of Maiden Lane, New York, a German firm, notifying that it had resumed the manufacture of certain chemicals, and suggesting the resumption of trade relations. The reply sent by each of the Australian firms took the form of a prompt and emphatic refusal. "We are thankful to say that we have not required any of the preparations of your manufacture which we used to sell," wrote Messrs. Faulding and Co., "and if you have had inquiries they are probably from Germans in this country, or from people who will sacrifice everything for the sake of cheapness." The letter sent by Messrs. Felton, Grimwade, and Co. concluded with the emphatic declaration: "None of us here want your products, your countrymen, or your communications."

PERSONAL.—Mr. E. Grant Hooper, Deputy Chief of the Government Laboratory, retired on superannuation last week after over 40 years' service. Mr. Grant Hooper has always taken great interest in the chemical industry. At the present time he is a member of Council of the Society of Chemical Industry and chairman of the Transactions Committee of the Society's *Journal*. From 1910-12 he was chairman of the London Section of the Society, and he has served on the Council of the Chemical Society and of the Institute of Chemistry. Before his appointment as Deputy Government Chemist he was for many years in charge of the Crown Contracts Branch of the Government Laboratory. Although the Civil Service regulations compel his retirement now from official duty, his energy is quite undiminished, and it is to be hoped that his knowledge and business acumen will for many years be utilised in commercial life.—Professor Alexander Findlay, Professor of Chemistry at the University College of Wales, Aberystwyth, has been appointed to the Chair of Chemistry at Aberdeen University. Professor Findlay graduated at Aberdeen and Leipzig. Before his appointment to Aberystwyth he was Special Lecturer on Physical Chemistry at Birmingham University.

A REMARKABLE CASE OF POISONING.—The extraordinary power and lasting effects of a type of poison gas or substance which was manufactured for military purposes at Chiswick Laboratory were revealed at an inquest into the death of Charles Orme, who was employed by the Ministry of Munitions, held at Acton on Tuesday before Mr. Komp and a jury. The evidence showed that deceased had been employed at the Chiswick Laboratory inspecting several of the rooms there, and he was taken mysteriously ill and died. Sir George Pollard, who had conducted the post mortem, was of opinion that the cause of death was blood poisoning due to inhalation of a poisonous substance. Mr. William Dunham, senior chemist at Chiswick Laboratory, said that what had been called a gas was not a gas but a solid. The premises had been properly cleaned, and all precautions taken to prevent anyone from suffering from the effects of this substance. He knew that people who visited the place suffered from irritation of the nose, which made them sneeze. Apart from the deceased, no one had been seriously affected. The still was thoroughly cleaned after it had come to an end in 1918. It had been treated once or twice, and used for the purification of methyl alcohol. All the witness himself had suffered from the effects of the substance was a slight irritation. So far as he knew, Mr. Orme was the only case in which death had ensued. The Coroner elicited the information that some people were much more easily affected by such a poison than others. He said this was a case in which, in the interests of the public, the nature of the substance should not be made known. The jury found that the deceased died from poisoning through the inhalation of a dust containing an irritant poison.

PARLIAMENTARY NEWS.

Sale of Calcium Nitrate Factory.

In the House of Commons, Mr. Rose asked the Parliamentary Secretary to the Ministry of Munitions if he will state the terms upon which the Government acquired the site and obsolete buildings utilised for the construction of the Royal Explosive Factory, Victoria Works, Wincham, Cheshire; what proportion of the £534,000. spent upon building and equipment was paid to the Salt Union and Messrs. Brunner, Mond and Co., Ltd.; and who advised his Department that this expenditure was useful only for war purposes?

Mr. Hope: The site and original buildings referred to were not acquired by the Government, but were rented from the Salt Union, Ltd., at £750. per annum, with an option to the Ministry to purchase at the fair value of the works as existing on January 1, 1916. The information asked for in the second part of the question cannot be supplied on such short notice; but I am having a statement prepared on the subject, which will be forwarded to the hon. member as soon as possible. The advice on which the Minister acted was that of the responsible officers of his Department.

Norfolk Petroleum.

Sir J. D. Rees asked the President of the Board of Trade whether he can give the House any information regarding the discovery of oil in Norfolk?

The Deputy-Minister of Munitions (Mr. Kellaway): I have been asked to answer this question. I have no information regarding the discovery in Norfolk of liquid petroleum. It has been known for a long time that the kimmeridge shales of Norfolk would yield considerable quantities of oil on distillation. The utility of this oil for commercial purposes depends, however, on the extent to which it might prove possible to eliminate the very high percentage of sulphur which it contains. We are doing everything possible to develop every possible source of oil in this country.

British Cellulose Company.

Lieut.-Colonel W. Thorne asked the Parliamentary Secretary to the Ministry of Munitions what was the total capital outlay of the British Cellulose Company on August 1, 1918; how much of this had been provided by the State, either in rebate of Excess Profits Duty or in any other form, and what were the total liabilities of the State in respect to this outlay; whether any further capital outlay has taken place since August 1, 1918; and, if so, does any liability rest upon the State to recoup the whole or part of any such outlay?

Mr. Kellaway: I would refer my hon. friend to the answer given on July 3 to his question on this subject. Until the Committee appointed by the Government have reported, I do not think it desirable to make any statement.

British Patents.

Lieut.-Colonel Sir J. Norton Griffiths asked the President of the Board of Trade what arrangements are being made to safeguard British patentees in respect of patents taken out before the war in countries which will be sub-divided in consequence of the terms of peace; and in what way will licences, granted by patentees to manufacture goods which could only be supplied in certain countries, be affected, having regard to the fact that such countries no longer exist in the form in which they did when the licence was granted?

Mr. Bridgeman: As regards the first part of the question, I would direct the hon. member's attention to Article 311 of the Treaty of Peace with Germany. The provisions of the Treaty with regard to licences granted before the war will be found in Article 310. Similar provisions will be embodied in the Treaties to be concluded with the other enemy Powers.

Storage of Explosives at Woolwich Arsenal.

Commander Bellairs asked the Prime Minister whether it is the custom to exempt State undertakings from the regulations made for public safety which are enforced with fines in the case of private undertakings; whether a Committee has reported that only 15 out of 172 buildings in Woolwich Arsenal comply with the Home Office regulations as to the distance between magazines and other danger buildings, and between these buildings and private dwellings; and what action is proposed in view of the warnings of the Committee?

The Deputy Minister of Munitions (Mr. Kellaway): The answer to the first and second parts of the question is "Yes,

sir." As regards the third part, immediately on receipt of the report the Minister appointed a Committee of Experts to consider the action to be taken on it, and the recommendations of that Committee are now being carried out. Very substantial reductions in the quantity of the explosives stored in the Arsenal have already been made, and are continuing. Most of the dangerous buildings have been or are being cleared.

Linseed Oil Deliveries to Germany.

Captain Brown asked the Food Controller what was the date when the agreement to supply Germany with 25,000 tons of linseed oil, at £78. per ton, was made; if this amount has now been delivered; and if any further agreements to supply linseed oil to Germany have been made?

Mr. Roberts: Approximately 12,000 tons of linseed oil have been delivered to Germany under the agreement of March 31, 1919. The answer to the last part of the question is in the negative.

Controlled Import of Plumbago.

Mr. Kellaway, in reply to Sir Harry Brittain, said: The importation of graphite into this country was not controlled by the Government, except that in the later stages of the war the Shipping Controller granted tonnage on the recommendations of the Ministry of Munitions based on the Ministry's knowledge of the quantities required to maintain the output of munitions.

GUTTA PERCHA.

THE material known by this somewhat curious appellation is the solidified gum of a tree, which is indigenous to the Malayan Islands. The name is Malayan—gutta, meaning gum, and percha, the tree from which it is obtained.

The most important use to which gutta percha is put is for the cores of submarine cables, and it was so employed in the construction of the first Channel cable in 1849. Since then it has come into general use for cable cores and insulation and for a number of other less well-known purposes. The India Rubber, Gutta Percha, and Telegraph Works Company, Ltd., one of the pioneer firms in the manufacture and laying of submarine cables (they made and laid a cable between Key West and Havana in 1867) have a special department at their works in Silvertown for the refinement of the raw gutta percha, and its reduction to various commercial forms.

There is an interesting and a pleasing variety about the Silvertown gutta-percha products. These include carboys, bottles, test tubes, tubes and valves for breweries, bosses for flax-spinning machinery, pump rings, buckets, seatings,

valves, hydrant balls, ram rings, driving belts, washers, and moulds for taking impressions of bores of guns. The Silvertown company also line tanks for acids and acid solutions.

Gutta percha, combined with resin and Stockholm tar, forms the famous Chaterton's compound, which is used for making joints in cables. The Silvertown company takes the greatest care in the preparation of the raw gutta percha, one of the later processes being to force the previously softened gum through a very fine sieve under a pressure of 100 tons, in order to remove all impurities, after which it is rolled out into sheets. In this form it is stored ready to be manufactured into any of the aforementioned articles.

Gutta percha, although it does not play such an important rôle in the commercial scheme as india rubber, to which it is similar in some respects, is absolutely irreplaceable by any other material in certain of its applications.

LEGAL INTELLIGENCE.

Chemical Company and Debenture Holders.

The case of *Louis Sanders v. The Abbey Chemical Company, Limited*, came before Mr. Justice P. O. Lawrence in the Chancery Division on Friday (July 11), on a motion by the plaintiff and other debenture holders for the appointment of a receiver and manager.

Counsel, on behalf of the plaintiff, said the debenture had matured, and had been presented for payment, but no payment had been made. He asked that Mr. James Fabian, of 27, Clement's Lane, London, chartered accountant, be appointed receiver and manager.

The application was opposed by counsel on behalf of the defendants and various debenture holders, and it was stated that at the present moment negotiations were going on for the reconstruction of the company and the provision of fresh working capital. It would be a great pity if these negotiations were to break down by appointing a receiver. There was no danger to the property, said counsel.

His Lordship said he thought the plaintiff was clearly entitled to a receiver, and he proposed to appoint Mr. Fabian, who was a chartered accountant.

Potash for Fire Extinguisher.

In the Patents Court on July 10 the *Citex Fire Extinguishing Company, Limited*, of Phipp Street, E.C. 2, applied for a licence to use the German patent 10,086, of 1908, in the name of Roemer, for the production of carbon dioxide for use in fire-extinguishing apparatus. The patent claimed in producing the carbon dioxide, which exerts pressure in fire-extinguishing apparatus, the application of a solution of substantially pure potassium carbonate of 96 to 98 per cent. strength.

Mr. A. J. P. Soar, secretary of the applicant company, explained that they had been manufacturing the chemical charge continuously for several years. They had originally an arrangement with the patentee, though the arrangement had not been registered, and they had had to pay the patent renewal fees and a royalty of a shilling on each cartridge, which sold at about 8s.

The Comptroller of Patents (Mr. Temple Franks): All the pre-war licences have gone, and if you want to be protected you must apply to this court. You should have applied before. There is the question whether the arrangement under which you work is a valid arrangement. If it was swept away what is to happen?

Mr. Soar: We have been very busy, and have had other things to think of, and, as a matter of fact, we could not get potash. Very little has been available during the war. The royalties are credited to the patentee in our office.

Sir Cornelius Dalton, who sat with the Comptroller: Do you mean to pay him?

Mr. Soar: We don't know. We don't want to pay anything we need not pay.

The Comptroller of Patents (who is just back from Paris): That may be a question under the Treaty of Peace. It will be raised afterwards. I think the licence should be granted. Other things will be arranged in time. The Board of Trade will be recommended to issue the licence.

A Soapmaker's Bankruptcy Examination.

At the London Bankruptcy Court last week, before Mr. Registrar Mellor, the public examination was held of Lloyd Dudley Stuart, trading as Dudley Stuart and Co., 14, America Square, E.C., and residing at 38, Genesta Road, Westcliff-on-Sea, soap manufacturer. The statement of affairs filed by the debtor showed gross liabilities amounting to £9,443. 19s. 5d., of which £6,162. 10s. 3d. was expected to rank against the estate for dividend. The assets were returned at £404., thus leaving a deficiency of £5,758.

In 1902 debtor, who was a commission agent, turned his attention to the manufacture of soap. He had not had any previous experience in the manufacture of soap, but opened a small factory in Canning Town, which he subsequently closed down. He did not have anything more to do with the soap business until 1916, when he advanced money to two Italians who carried on a soap business at Noxton, under the style of the Vebo Soap Company. In March, 1917, he made an agreement with them under which he was to receive 10 per cent. of the profits. Subsequently the business was transferred to Bowes Park, and he made himself responsible for the debts incurred. As a matter of fact, he entered into partnership with the two Italians, but there was no deed

of partnership. The names of his partners were Wilberforce Borg and Wagram Borg. On November 23, 1917, the name of the firm was changed to the British Soap Company, and he agreed to find all the moneys required for the business, including the wages and the cost of the materials. In April, 1918, the Borgs and himself got into trouble for infringing the bye-laws of the Wood Green Council, through not asking their consent before starting the soap factory. He sold part of the plant back to the people who supplied it, and removed the remainder to Kintore Street, Bermondsey, where he carried on the manufacture of soap for export at an average profit of £100. per month until the Government prohibited all exports, except under licence. He had never been able to obtain accounts from the Borgs as to the cost of manufacture, but he alleged that they owed him a considerable amount of money. He further alleged that the business was a failure owing to the incompetency of the Borgs and wasteful methods of manufacture. Of his deficiency of £5,000., upwards of £4,000. related to the Bowes Park business. He owed £2,000. to a Mr. Pierreboom under an arbitration award. Another large creditor was a Mr. Bourgeois in respect of oils supplied.

The examination was ordered to be closed.

Liquid Asphalte for Oil Engines.

Lord Sterndale in the Prize Court on Wednesday condemned as prize 12,809 barrels of "liquid asphalte" shipped by a Texas company at the beginning of 1916 on the steamship *Avra*, and consigned to the Isonteluis Handels Kompany, of Stockholm, and the question of the utility and nature of the "liquid asphalte" was raised by the problem of contraband.

Dr. Wyndham R. Dunstan, director of the Imperial Institute, made a report to the court of an analysis of the liquid asphalte. The samples, he said, were found to consist of crude petroleum from which the lower boiling fractions had been removed by distillation, leaving a product which was suitable for use as fuel, particularly in certain types of heavy oil engines. This so-called liquid asphalte came within the description "mineral oils," including benzine and motor spirits, included in the list of absolute contraband dated October 14-15.

OUR BOOK SHELF.

THE ANALYSIS OF MINERALS AND ORES OF THE RARER ELEMENTS. By W. R. Schoeller, Ph.D., and A. R. Powell. London: Charles Griffin and Co., Ltd., 16s. net.

In this book the complete analysis of rare-element minerals receives, probably for the first time, full and systematic treatment. Although various books and treatises have been consulted for data, some new separations have been specially devised. In this respect we might mention, as examples, the separation of molybdenum from antimony, and palladium from silver, etc. The keynote is complete analysis, the plan being generally in tabular form, whilst full details of operations will in every case be found in the book. The elements dealt with in the order of their groups are: Lithium, rubidium, caesium; beryllium, radium; scandium, gallium, indium, thallium; cerium, rare earth metals other than cerium; titanium, zirconium, thorium, germanium, vanadium, columbian, tantalum; selenium, tellurium, molybdenum, tungsten, uranium; ruthenium, rhodium, palladium, osmium, iridium, platinum. A table of melting points recently issued by the U.S. Bureau of Standards is included.

SALT. By A. F. Calvert. London: Sir Isaac Pitman and Sons, Ltd.; 2s. 6d. net.

An interesting and very readable booklet of the Pitman "Common Commodities and Industries" series. From technical and historical aspects, it serves a useful educational purpose. Illustrations are quite excellent.

DYERS' MATERIALS. By Paul Heermann, Ph.D. London: Scott Greenwood and Son. 7s. 6d. net.

This, the second edition, has been revised and enlarged by H. B. Stocks, F.I.C., F.C.S. We agree with the author's contention that there is ample scope for a book confined to substances used in dyeing and kindred processes, and there is no doubt this little book will make many friends. Both organic and inorganic essentials in these important processes are well presented to the reader, and in every case valuable hints are given dealing with their special application. Numerous plates are contained showing the microscopic appearance of textile fibres and various starches.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS.

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month ending June 30, 1919, as compared with June, 1918.

(To be concluded.)

REPORTS OF COMPANIES.

Mond Nickel Company, Ltd.

The report to April 30 last states that the balance to credit of profit and loss account is £422,658. Directors propose interim half-yearly dividend on preference at 7 per cent. per annum, paid February 5, less tax; dividend now to be paid on preference at 7 per cent. per annum, less tax; interim dividend on ordinary of 1s. per share, paid February 5, free of tax; dividend now to be paid on ordinary of 2s. 6d. per share, free of tax; forward, £168,058. The operations of the company, both in Canada and England, have been carried on throughout the year without interruption. Owing to dislocation of trade after the conclusion of the armistice, finished stocks unsold at the end of the financial year have largely increased. This, together with the fact that large stocks of nickel have been accumulated by the British and Allied Governments during the war, has necessitated temporary reduction of output.

W. J. Bush and Co., Ltd.

Accounts for 1918 show a gross profit of £271,277. After providing for debenture interest, expenses, and directors' remuneration, and making allowances for depreciation, there is a net profit of £65,903., which, with amount brought in, makes £96,508. After deducting the amount required for dividends on preference shares, there remains £90,258. The directors recommend a final dividend of 15 per cent. on the ordinary shares, making 20 per cent. for the year, placing £20,000. to general reserve fund, £10,000. to writing down goodwill, and carrying forward £35,258. (out of which will be paid excess profits duty for 1918). In March last the company received a letter from the Foreign Office stating that the company's premises in Moscow had been sealed up by the Soviet Government. The buildings and plant at Ash Grove, Hackney, and elsewhere, have been fully maintained.

Kynoch, Ltd.

The report for the nine months ended December 28, 1918, states that the directors are not able to present the balance-sheet as at December 28 owing to the enormous amount of work which has had to be done in connection with the termination of the war and the change-over to peace conditions. They are, however, satisfied from figures put before them that the profit is sufficient for the dividend of 14 per cent., subject to tax, on ordinary. Dividend on preference shares at rate of 5 per cent. per annum, free of tax, for three months ended December 31, will be paid at the same time as ordinary.

Lever Brothers, Ltd.

At Port Sunlight on July 11, an extraordinary general meeting of shareholders was held to confirm the resolutions of the extraordinary general meeting three weeks ago. The resolutions relate to an increase of capital from £60,000,000. to £100,000,000., and to develop and purchase new businesses as required. This was agreed to without opposition.

Van Den Berghs, Ltd.

An extraordinary general meeting was held on Friday of last week for the purpose of passing resolutions for increasing the capital of the company to £3,075,000. by the creation of 1,000,000 new shares of £1. each, to be called "C" preference shares. Sir Herbert M. Praed, Bart., presided, and in the course of his remarks stated that the money would be required for a large area of land in Fulham with extensive buildings and warehouses, which had been purchased.

The resolutions were adopted.

Borax Consolidated, Ltd.

A meeting is called for July 22, at the Cannon Street Hotel, to consider an increase of capital from £2,300,000. to £2,900,000. by the creation of 600,000 new deferred ordinary shares to rank equally with the original deferred ordinary shares, and to be issued at such time and at such premium as the directors may think fit.

British South African Explosives Company, Ltd.

Dividend of 8½ per cent (1s. 0.06d. per share), less tax, for year. £24,533. for factory depreciation; £1,500. for depreciation of securities; £85,939. forward. Last year, 11 per cent.; £20,102. for factory depreciation; £63,565. forward.

British Dyestuffs Corporation, Ltd.

Lord Moulton presided at a special meeting of the shareholders of the British Dyestuffs Corporation, Limited, in Manchester, on Thursday, called for the purpose of sanctioning a proposal of the directors to issue further preference and ordinary shares. He announced that the Government had become shareholders in the company to the extent of £850,000, invested in preference shares, and a similar amount in preferred ordinary shares. The issue of extra shares was necessary in order to satisfy the full needs of the textile industry. The fact that the Government were shareholders would give enormous strength to the company, and the shares were issued on exactly the same terms as those in respect to other shareholders. There was no need to point out the great importance of obtaining more capital to enable the company to undertake great gigantic work facing it.

In reply to a shareholder, Lord Moulton said no preference at all had been shown to the Government in purchasing the shares.

The proposal was carried unanimously.

DIVIDENDS.

W. AND H. M. GOULDING, LTD.—Dividend at rate of 7 per cent. per annum, and bonus of 3s. per share.

BRITON FERRY CHEMICAL AND MANURE COMPANY, LTD.—Interim dividend of 7½ per cent., less tax, same as a year ago.

LINOLEUM MANUFACTURING COMPANY LTD.—Interim dividend of 5 per cent. actual (5s. per share).

BRITISH OIL AND CAKE MILLS, LTD.—Interim dividend on the ordinary of 10 per cent. (less tax) for current year.

EASTERN SMELTING COMPANY, LTD.—Interim dividend on preferred ordinary at the rate of 10 per cent. per annum.

NEW COMPANIES.

Headley, Birch and Co., Ltd.—Private company. Capital £40,000., £1. shares. Metal manufacturers, etc. Solicitors: Coley and Coley, 63, Temple Row, Birmingham.

Sheet Metal and Galvanising Company, Ltd.—Private company. Capital £10,000., £1. shares. Office: 2a, Tyrell Street, Bradford.

Standard Oil and Refining Company, Ltd.—Private company. Capital £300,000., £1. shares. Solicitors: Piesse and Sons, 15, Old Jewry Chambers, E.C.

Taylor and Evans, Ltd.—Private company. Capital £3,000., £1. shares. Chemical and colour merchants and manufacturers. Office: 8, Victoria Street, Liverpool.

H. Rollet and Co., Ltd.—Private company. Capital £15,000., £1. shares. Object: To acquire the business of a metal merchant and metal warehouseman carried on by S. T. Medlicott. Office: 34-6, Rosebery Avenue, E.C.

John Forster and Co., Ltd.—Private company. Capital £20,000., £1. shares. Object: To take over the business of oil, paint, and shipstore merchants carried on at Sunderland by John Forster and Co.

Landore Zinc Works, Ltd.—Private company. Capital £100,000., £1. shares. Object: To take over the business of zinc oxide manufacturers carried on at Landore, Glam., as "Jno. R. Down and Co." Solicitors: Stephenson, Harwood and Co., 31, Lombard Street, E.C.

Kappa Works, Ltd.—Private company. Capital £30,000., in 29,990 ordinary shares of £1. and 200 founders' shares of 1s. Manufacturers of and dealers in photographic sensitive papers, etc. Office: 2, Verulam Buildings, Grays Inn, W.C.

The Associated Lead Manufacturers, Ltd.—Capital £1,500,000., in 1,000,000 preference and 500,000 ordinary shares of £1. each. Objects: To acquire, hold, and deal in stocks, shares, and securities (particularly those of companies engaged in businesses below mentioned); to carry on, manage, or direct the management or operation of the businesses of (a) manufacturers of and dealers in refined pig-lead, dry white lead, white lead in oil, white-lead paint, red, orange, and antimonial lead, copper slags, litharge, flake litharge, lead sheets and pipes, tea lead, lead foil, block tin, tinfoil, zinc rods and sections, composition rods and pipes, tinned pipes, shrapnel bullets, lead shot, dry colours, coloured paints, bitumastic ships' anti-fouling composition paints, zinc oxide, zinc sheets, zinc sulphate, and other things made of lead or lead compounds, and (b) lead merchants and manufacturers, smelters, refiners, manufacturers of sanitary appliances and the like. Registered office: 70, Lombard Street, E.C.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

The specifications of the following applications are not printed by the Patent Office until the complete specifications have been accepted.

July 7th to July 12th (inclusive).

- Drying China Clay. Adair, J. 16,953.
 Extraction of Tin from its Ores. Annable, H. W. C.; and Janson, E. W. 17,052.
 Anhydrous Magnesium Chloride or Anhydrous Double Chlorides of Magnesium. Ashcroft, A. E. 17,246.
 Electrolytic Decomposition of Anhydrous Magnesium Chloride and Production of Magnesium or Alloys Thereof and Chlorine. Ashcroft, E. A. 17,247.
 Production of Magnesium or Alloys of Magnesium and By-products. Ashcroft, E. A. 17,248.
 Regulating Operations in Rectifiers for Rectifying Mixtures of Liquefied Gases. Barbet et Fils et Cie, E. 17,221.
 Continuous Distillation of Glycerine from Weak Alcoholic Liquors of Fermented Liquids. Barbet et Fils et Cie, E. 17,222.
 Recovering Aniline and Toluidine from Aqueous Solutions Thereof. Barnett, E. de B. 17,460.
 Recovering Lecithine from Organic Compounds. Baumann, C.; and Grossfeld, J. 17,418.
 Paint. Bienenfeld, J. 17,508.
 Treatment of Heavy Oils. Dunstan, A. E.; and Thole, F. B. 17,114.
 Treatment of Ammoniacal Liquor. Fairweather, J. H. 17,186.
 Pyroxilin Solvent. Flaherty, E. M. 17,082.
 Borax, Boric Acid, and Lard Recovery. Fleming, E. L. 16,940.
 Treatment of Hydrocarbons. Forwood, G. F.; and Taplay, J. G. 16,961.
 Apparatus for Manufacture of Superphosphates, etc. Guillaume, F. 17,007.
 Anti-corrosive Paint or Composition. Ivinston, C. H.; and Roberts, G. S. 17,490.
 Separating Constituents of Gases or Vapours. Loring, F. H. 17,006.
 Colorimeters. Ormandy, W. R. 17,241.
 Indicating Level of Liquid in Closed Tank. Orok, W. M. 17,560.
 Separating and Reclaiming Oil from Waste Materials. Pritchard, E. R. 17,055.
 Acid-resisting Pipes, Cylinders for Scrubbers, Towers, etc. Rammage, A. 17,168.
 Electrolytically Depositing Copper, etc., on Aluminium and its Alloys. Rhodin, J. G. A. 17,443.
 Pyrometer. Schneiderman, L. 17,001.
 Precipitating Aluminium Hydrate. Sherwin, R. S. 17,084.
 Nitration of Phenols. Silberrad, O. 17,280.
 Mixing Gases with Liquids or Solids. Soc. Anon. l'Oxydrique Française. 17,428.
 Purifying Gases for Synthetic Production of Ammonia. Soc. l'Air Liquide, Soc. Anon. pour l'Etude et l'Exploitation des Procédés G. Claude. 16,986.
 Production of Acetylene, Acetaldehyde, etc. White, W. C. 17,434.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C.

1917.

- Apparatus for Expressing Liquid from Materials Containing the Same. Wallich, C. A. N. 5,591. 128,964
 Dopes or Varnishes for Aircraft Construction. British Aeroplane Varnish Co.; and Groves, S. E. 12,807. 128,974
 Manufacture of Gun-cotton. National Explosives Co.; and Bate, W. 12,845. 128,978
 Alkali Fusion of Aromatic Sulphonic Acids. South Metropolitan Gas Co.; and Evans, E. V. 13,514. 129,002
 Mercury Vapour Lamps. Cornu, M. J. 13,807. 129,022
 Recovery of Ether and Alcohol from Vapour-laden Air. Craig, R. A.; Robertson, Sir R.; Masson, J. I. O.; and Drummond, A. A. 13,874. 129,024
 Manufacture of Furfural. Recard, E. 13,880. 129,025
 Solutions of Cellulose Esters. British Aeroplane Varnish Co.; and Ward, J. G. 14,080. 129,033
 Explosives. Marin, A. J. 14,160. 129,036

1918.

- Decolourisation and Purification of Trinitrotoluol and Other Crystallisable Organic Compounds, and Apparatus Therefor. Morris and Co., H. N.; Morris, H. N.; and Sable, J. 9,258. 129,074
 Apparatus for the Destructive Distillation and Carbonising of Pitch. Perkin, F. M.; and Nitrogen Products and Carbide Co. 10,759. 129,091
 Concentration of Sulphuric Acid. Perrin, F. 11,021. 118,695
 Retorts for Use in the Destructive Distillation of Coal and the Like. West, J.; and Wild, W. 11,738. 129,139
 Production of Azides. Hodgkinson, W. R. 12,881. 129,152
 Process and Apparatus for Purifying Camphor. Du Pont de Nemours and Co., E. I. 13,076. 124,413
 Emulsifying Agent Especially Intended for Use in the Manufacture of Margarine. Rushen, P. C. (Naamloze Vennootschap Anton Jurgens Vereenigde Fabrieken). 14,329. 129,165
 Process for the Production of Blue Sulphur Dyes. Ellis, G. B. (Chemical Works formerly Sandoz) 16,761. 129,182
 Explosives. Marin, A. J. 20,180. 121,294

1919.

- Process for the Preparation of Anhydrous Sulphide of Zinc. Comment, P. 6,089. 126,274

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Nitro-compounds. Clayton Aniline Company, A. Schedler, and V. Vuilleumier, Clayton, Manchester. British Patent, 126,355, of 1917.

The continuous nitration of organic liquids is carried out in a plant consisting of (1) a series of open measuring tanks containing the nitric acid, sulphuric acid, liquid to be nitrated, and water for dilution if necessary, the base areas of the tanks being proportional to the requisite volumes of the several liquids; (2) reaction pans of uniform size and shape arranged in a stepped series and provided with agitators; (3) a separator into which the product of reaction flows and

separates into nitro-body and waste acid, which flow off from the top and bottom respectively to suitable receptacles. The two acids are run continuously from their measuring tanks into the top reaction pan, and are mixed therein; the mixture flows down to the next pan, into which the liquid to be nitrated is also running from its measuring tank; the reacting mixture flows down through as many pans as are necessary to complete the reaction, and finally (after dilution with water if necessary) the product flows into the separator. The illustration shows an arrangement suitable for nitrating toluene to mononitrotoluene; the tanks R¹, R², R³ contain respectively sulphuric acid, nitric acid, and toluene; the two acids are run into the pan P¹, and after mixing run into pan P², which also receives toluene from tank R³; the mixture then flows through pans P³, P⁴, to the separator T; the temperatures in the several pans are suitably adjusted by heating or cooling coils. A similar arrangement, using four measuring tanks and seven reaction pans, is described for nitrating a mixture of mono-, di-, and tri-nitrotoluene to tri-nitrotoluene. Details of quantities of reagents, temperatures, etc., in these two processes are given. The process and plant may also be applied to the continuous nitration of benzene to mono- or di-nitrobenzene, xylene to mono- or di-nitroxylene, chlorbenzene to mono or di-nitrochlorbenzene, etc. Specification 16836/10 is referred to.

Phenols. D. Tyrer, Stockton-on-Tees. British Patent, 125,625, of 1916.

Phenol or a homologue thereof is separated from aqueous solutions by agitating with nitrobenzene, which may be mixed with a diluent such as benzene, solvent naphtha, paraffin, etc., which diminishes the specific gravity so that the mixture will float on water.

Cracking Oils. R. Cross, Kansas City, U.S.A. British Patent, 126,103, of 1918.

Heavy hydrocarbons are converted into light hydrocarbons by distilling them under a pressure of 400–1,000 lb. per sq. in., and passing the resulting vapours under the same pressure over and into contact with the cool heavy hydrocarbons on their way to the still. The apparatus comprises a still 6 in which the oil, heated by circulation through a heated coil 16, vaporises under pressure. The resulting

vapours pass through a pipe 7 into a container 5, which is continuously supplied with cool oil by a pump 2, and from which the oil after it has taken up the heavier constituents of the vapours flows by a pipe 8 to the still 6. The requisite pressure is maintained by a valve 11 on the vapour outlet pipe 23. The distillation is usually effected at 300–450° C., the pressure being 600 lb. per sq. in.

Drying Apparatus for Picric Acid. N. H. Graesser and E. Williams, Ruabon, Denbighshire. British Patent, 126,077, of 1916.

The drying of picric acid is effected by passing it through a heated chamber by means of a belt or band conveyer. The apparatus shown comprises a heated chamber *g*, through which the material is carried on a band *b* driven by rollers *c* with teeth *d* engaging perforations in the sides of the band. The band is supported by rollers *f*, which are of varying diameters

to agitate the material in its travel; weighted rollers *k* are provided for tensioning the band. The chamber is heated by steam pipes *i*; currents of hot air may also be used. A feed hopper *a*, outlet *l*, and inspection windows *h* are provided. Jets or sprinkler pipes are provided to drench the material in case of fire.

Hydrogen. R. and J. Dempster, Ltd., and J. M. Ballingall, Manchester. British Patent, 126,251, of 1918.

In the manufacture of hydrogen by passing steam over heated iron, the iron oxide produced is reduced in two stages; Firstly, by means of previously used water gas which has been dried and condensed, termed secondary gas; and, secondly, by means of fresh-water gas, termed primary gas, which may afterwards be reused as secondary gas. The second operation may be of longer duration than the first, and the primary gas used at the commencement of the second operation may be passed away without being utilised as secondary gas.

Catalytic Production of Sulphur Trioxide. W. J. Mellersh-Jackson, London. (A communication from Bombrini Parodi-Delfino, Rome.) British Patent, 126,396, of 1917.

In the production of sulphur trioxide, a single apparatus is employed through which the sulphur dioxide is passed on its way to the catalytic chamber, and in which it can receive heat either from an external source or from the sulphur trioxide leaving the catalytic chamber, or from both sources

simultaneously. The apparatus described comprises a number of concentric tubes as shown. The hot gas acting as the external source of heat enters at B and leaves at C after passing around the tubes. The sulphur dioxide enters at G and leaves at H, and the sulphur trioxide enters at I and leaves at J.

Sulphuric Acid. Chance and Hunt, Ltd., Oldbury; W. A. S. Calder, Edgbaston; and C. A. O. Fox, Langley. British Patent, 126,320, of 1916.

Sulphuric acid is separated from the fumes evolved in concentrating sulphuric acid by causing the gases at 95-135° C. to travel at high velocity through a constriction in the pipe conveying them.

velocities of 35-70 ft. per second being mentioned. If the gases are also caused to change their direction, the velocity may be as low as 20 ft. per second. The constriction may be formed by placing obstructions or packings in the tube *a* or in a constriction in the tube—for instance, pipes *b* may be used, Fig. 2; or, with change of direction, bars *c*, Fig. 4, may be arranged in staggered relation, or perforated plates with the perforations in staggered relation may be used. The condensed acid may be drawn off at a point following the constriction.

Extracting Fats, Sugar, Etc. J. de Raedt, Court St. Etienne, Brabant, Belgium. British Patent, 126,262, of 1919.

In apparatus for extracting fats, oils, sugar, and the like by means of solvents in an oscillated container, the inlets and outlets 5, 13 for the solvent or other fluid are arranged along the top and bottom of the drum 1, and are connected to the main supply pipes P by flexible tubes 10. Filters comprising mats 20 held between perforated plates 19 may be arranged a short distance from the inlets and outlets. Compartments

are formed in the drum by porous or perforated plates 18, and steam-heated coils may be arranged below each division. The drum is filled and emptied through doors 21. In the preferred method of working, hot solvent vapour is admitted to the exhausted charged drum before any liquid solvent, and the residual solvent is removed by hot steam generated from air-freed water.

Acetaldehyde. J. Crosfield and Sons, Warrington; and T. P. Hilditch, Grappenhall, Cheshire. British Patent, 125,926, of 1918.

In the production of acetaldehyde by passing acetylene into acid solutions of mercury salts, the mercury sludge formed in the process is revived by adding to the reaction liquid a small quantity of hydrogen peroxide, and agitating the mixture by passage of gas or by mechanical agitation; the revivification is repeated until the solution ceases to be an effective absorbent. The reaction liquid should contain 0.5 to 1.5 per cent. of mercuric oxide, and the apparatus should be free from metallic parts; the lower part of the apparatus should contain baffles to break up the gas current. A detailed example is given. Specification 105,064 is referred to.

Nitrogen. E. A. Ashcroft, London. British Patent, 125,714, of 1918.

An alloy containing from 5 to 50 per cent. of magnesium and from 95 to 50 per cent. of lead is used in presence of water vapour to absorb oxygen from gaseous mixtures containing it, and particularly for the preparation of nitrogen from atmospheric air. An alloy of 15 per cent. of magnesium and 85 per cent. of lead is suitable for use cold, for instance, in granular or powder form. The gas mixture may be passed over or through the alloy, or may be exposed to it while confined in a gas-holder over water.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—The official total of the June shipments from Chili is 36,190 tons, of which 4,090 to Europe, 19,640 to the United States, and 12,460 to "other parts"; the exact production was 128,730 tons, leaving stocks of manufactured nitrate on hand at July 1, 1,488,760 tons. There is nothing to report with regard to the position of the article on this side, the agricultural demand being "nil," as usual, at this time of the year, the few parcels changing hands for chemical purposes fetching rather more money than of late owing to the scarcity of supplies held by merchants. The Government still advertise "large surplus stocks of nitrate of soda, calcium nitrate, and ammonium nitrate," but particulars of prices have not transpired. Business in Chili is practically at a standstill as far as the Associated Producers are concerned, and their position is rapidly becoming unbearable, the only recent sale out of their enormous accumulation of stocks having been a small quantity of "refined" for August shipment at 9s. 8d. per quintal, f.o.b. It may readily be imagined that buyers are not disposed to operate in this direction when they can effect purchases on much more favourable terms through the Chilean Government. The latter, acting on behalf of the native and German producers standing out of the Association, seem not to have let the grass grow under their feet, it being circumstantially stated that they have sold 50,000 tons of nitrate to Holland and 20,000 tons to Spain, besides arranging with a French syndicate for the annual shipment of 300,000 tons for three years; negotiations are also said to be proceeding with Italy for 100,000 tons from the German oficinas—in every case at prices considerably below those "fixed" by the Association. No wonder there is a flutter in the nitrate dovecot!

Fertilisers on the Continent.—In reference to a decision recently announced on the part of the Unione Concimi to reduce the price of superphosphate by about 20 per cent., it is stated that the Societa Collae Concimi di Roma has unreservedly adhered to this basis of price, and that its intention is for the coming spring to make a new and serious reduction in sale prices. Merchants and consumers of fertilisers are therefore advised to limit their purchases to the quantity that will be required for the coming autumn season. The journal announcing this movement observes that the Government would be doing a praiseworthy thing if they would liberate the necessary ships for the transport of phosphorites. The result, it is thought, would be a further and a greater reduction in prices in the very near future.

At a recent fair held at Utrecht a large number of Dutch chemical manufacturers exhibited, thus proving that under the protection of the war the chemical industry in Holland has made important progress. Amongst the products exhibited were artificial manures, sulphuric acid, phosphoric acid, nitrate of ammonia, sulphate of ammonia, phosphate of ammonia, phosphate of calcium, sulphate of soda, and bisulphate of soda.

Important Algerian Fertiliser Combination.—The shareholders of the Algerian Chemicals and Fertiliser Company are convoked to a general and extraordinary meeting on July 30 to approve the report of the commissioner on the question of amalgamation with the Tunisian Chemical Fertiliser Company.

Sulphate of Ammonia.—The average export value of sulphate of ammonia at present is about £25. per ton, net cash, in double bags, f.o.b., British port; and the fixed price for home agriculture is £19. 10s. per ton, net cash, delivered destination required by buyer in Great Britain for July-September delivery. The market does not appear to be very active at the moment, but the under-current is good. People seem to be paying more attention now to the American production of sulphate of ammonia, especially with regard to its prospects of securing a hold upon foreign markets. In these columns the American market has been noted from time to time, and readers will know, therefore, that this is a section of the market to watch. Latest advices from the other side of the Atlantic announce that there has been no easing off in the demand for American sulphate for export. The domestic consumer is somewhat reluctant to bring full demands to the market, presumably waiting possible lower price levels. In the meantime, holders out there state that there is no necessity for making concessions to stimulate local trade, and therefore prices are firmly maintained. Some attention is also being directed to the possibility of develop-

ment of the German export trade in sulphate of ammonia, which may be reanimated earlier than expected. The price of sulphate of ammonia in France has been reduced slightly, and the material will be sold at this reduced figure until November 15 it is said.

Slag and Superphosphate.—The bookings continue to be good for deliveries of basic slag over the season, and quite a respectable quantity is on order for deliveries over this and next month. Representative prices appear to be £3. 2s. to £3. 12s. per ton for prime slag, 12-22 per cent. phosphate, in bags; with £3. 15s. to £5. 2s. for 24-42 per cent. It was held that there would be a larger output of basic slag during the season, but the demand even then threatens to outpace it. Superphosphate business remains pretty level, with prices as already given here.

Bone Meals.—The position of this market still remains unsatisfactory from the agricultural standpoint. Larger supplies, especially from India, are being asked for, but they do not mature. At the same time prices, whilst still being high, cannot be regarded as extravagantly so, and a fair level of trade is moving. From £12. to £13. 10s. is still being quoted for pure dissolved bones, 3-3 per cent. ammonia and 35 per cent. phosphate; with £11. to £11. 5s. for pure steamed bone meal, 1 per cent. ammonia and 60 per cent. phosphate, in both cases ex works.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

Fuel prices are interfering with the extent of business in the tinplate trade, and manufacturers in their quotations are acting with great caution regarding the question of delivery. Forward bookings are only entertained on small limits, and it is feared that American competition will prove too great for Welsh makers to retain their former prestige in markets hitherto exclusively supplied by them. The advance of 6s. per ton on coal will have a serious effect on this staple industry, which is already in a critical state owing to the demands of labour and the high prices of steel and other raw materials.

Mr. G. Rudd Thompson has been appointed by the Society of Public Analysts to represent them on the Standards Committee of the Institute of Chemistry "to consider the advisability of making provision for the preparation and issue of authoritative samples of chemical substances, ores, metals, etc., of ascertained composition," which are to be officially recognised as standards of purity for national use. Mr. Thompson is the public analyst for the county of Monmouthshire.

The Council of the University of Wales has appointed Mr. H. Ll. Bassett, B.A., B.Sc., lecturer in organic chemistry. During the last three years Mr. Bassett was assistant demonstrator in the University laboratory, Cambridge.

It is too early to form any definite idea as to the effect of the advance in the price of coal upon the export trade in patent fuel, which of late has been steadily increasing.

The prospects of better trading in the spelter trade are brightening, and, given stability in labour matters, foreign competition will not cause much worry. Two thousand tons of zinc concentrates arrived this week from Australia and 200 tons from Port Pirie.

ACETYLENE AS MOTOR FUEL.—In Switzerland, where hydro-electric power for making calcium carbide is abundant, acetylene is the most promising substitute for petrol as a motor fuel. Its drawbacks include violent explosiveness when mixed with compressed air in the carburetter, and corrosion or clogging of the motor by soot and acids of combustion. Remedies are dilution of the acetylene and an extra air supply to ensure burning all carbon. H. Grossmann reports that the explosion of even the diluted freshly generated acetylene is too sudden, but that acetylene from a solution in acetone carried under pressure in steel cylinders is safer, and is ready for the instant starting of the motor until the cylinder is practically emptied. The cylinders, however, are not only heavy and expensive, but are not generally obtainable. A large one for a motor-car gave a run of 75 miles from one charging. Diluents included alcohol, petrol, light tar oils, naphthalene, water, etc., and the use of at least 20 to 25 per cent. was necessary. Good results were given by 20 per cent. of an equal mixture of light tar oil and alcohol.

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

Broughton Rubber Company, Ltd.—Resolved June 30: That the company be wound up. F. S. Burman, 29, Princess Street, Manchester, chartered accountant, liquidator. Meeting of creditors at liquidators, July 18.

Thompson (Jabez) and Sons, Ltd., Northwich.—Resolved June 11, confirmed June 26: (1) That the company be wound up. J. H. Worthington, 11, Spring Gardens, Manchester, chartered accountant, liquidator. (2) That an agreement, dated June 18 (now produced and read to the meeting), between this company and Brunner, Mond and Co., Ltd., providing for the sale to the latter company of the business of this company, including its machinery, plant, stocks, and other assets mentioned in said agreement, be and the same is hereby approved and ratified. (3) That the liquidator be and is hereby authorised to carry out the sale. Meeting of creditors, Halliday, Pearson and Co.'s, 11, Spring Gardens, Manchester, July 16.

Waste Conversions, Ltd., London, E.C.—Resolved June 30: That the company be wound up. G. D. Cahill, 4, Tokenhouse Buildings, E.C., liquidator. Meeting of creditors registered office, 4, Tokenhouse Buildings, E.C., July 17. Claims to liquidator by July 31.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Luke and Bailey (Anthony Jno. Luke and Jno. Gregory Bailey), 1 to 4, Great Tower Street, E.C., chemical merchants. June 24. Debts due and owing to or by the said late firm will be received or paid by Black, Geoghegan and Till, 21, Bucklersbury, E.C. (July 1.)

Martin and Lanning (Sidney Martin and Geo. Lanning), Westgate Buildings, Bath; oil and colour merchants. June 25. Debts by S. Martin. (June 27.)

CONTROL OF SEEDS, OILS, AND FATS.

THE Ministry of Food announce that the Seeds, Oils, and Fats Order was issued by the Food Controller with the intention of protecting the consumer by the elimination of speculation. It is felt that the effective operation of the Order can best be secured by the trades themselves. It has therefore been decided to invite the co-operation of the recognised Associations concerned with the different products. These associations issue contracts, arrange for arbitration, and settle commercial disputes, and are thus in touch with the operations of practically the whole body of traders. The Food Controller has therefore authorised the issue of licences on his behalf by the following associations:—

London, Bristol, and Scottish Areas. The Incorporated Oil Seed Association, Exchange Chambers, St. Mary Axe, E.C. 3; London Oil and Tallow Trade Association, Crosby Buildings, Gt. St. Helen's, E.C. 3; London Corporation Association, 165, Fenchurch Street, E.C. 3; United Kingdom Brokers' Association, 14-20, St. Mary Axe, E.C. 3.

Hull Area.—Hull Oil Seed and Cake Association. Exchange Buildings, Hull.

Liverpool Area.—Liverpool United General Produce Association, 13, Rumford Street, Liverpool.

Licences to consumers in the soap trade are issued by the Scapmakers' Federation; to consumers in the paint and varnish and allied trades by the National Federation of Paint and Varnish Makers. The latter Association also issue licences to deal in linseed oil to their own members under certain circumstances. All the necessary information with regard to licences can be obtained from the secretaries of the associations concerned.

MARKET REPORTS.

TAR AND AMMONIA PRODUCTS.

WEDNESDAY.

Benzole: London, 90%, 1s. 11d. to 2s.; North, 1s. 9d. to 1s. 10d.; 50%, 1s. 9d. to 1s. 10d.; North, 1s. 9d., naked. Carbolie acid, crude, 60%, East and West Coast, nominally 1s. 3d.; crystals, 30-40%, 5d. to 6d., f.o.b. Crude tar, London, 42s. to 43s.; Midlands, 37s. to 38s.; North, 36s. to 37s. per ton, ex works. Pitch, 72s. 6d. to 75s.; East Coast, 65s., f.o.b.; West Coast, 52s. to 54s., f.a.s. Solvent naphtha, naked, London, 90-100%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 90-100%, naked, London, 2s. 1d.; North, 1s. 10d. to 1s. 11d. Crude naphtha, naked, 30%, 8d. to 8½d.; North, 7½d. to 7¾d. Refined naphthaline, £18. to £22; salts, £6. to £7. Toluol, naked, London, 2s. 1d.; North, 2s. Creosote, naked, London, 5½d. to 5¾d.; North, 5d. to 5½d.; heavy oil, 6¾d. to 7d. Anthracene, 40-45%, 6d. per unit. Cresylic acid, 95%, 2s. 7d. to 2s. 8d.; 97-99%, 2s. 9d. to 2s. 10d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: Home trade, £19. 10s. per ton; basis 24½%. Nitrate of soda, £21. to £22.

FERTILISER MATERIALS.

LIVERPOOL. THURSDAY

Nitrate of soda continues firm, the quotation for 95-96% quality being £21. 2s. 6d. per ton, net cash, f.o.b., prompt delivery. East Indian bone meal is again firmer, and the nearest value of 14% ammonia and 32% phosphate of lime, August-September shipment, is now £11. per ton, net cash, ex ship Liverpool. On spot, holders are also firmer, and now ask £15. per ton, net cash, for 4½ and 45% quality. Mineral phosphates: No alteration is to be reported in this market, and values are at present only nominal. Dried blood: Supplies of this material are scarce, the value being about 25s. to 30s. per unit of ammonia per ton, net cash.

LONDON METAL MARKET.

THURSDAY

Copper: Standard brands, £105. to £105. 10s., cash; £105. 10s. to £106., three months; electrolytic, £106. to £115. Tin: Standard, £254. 10s. to £254. 15s., cash; £254. 5s. to £254. 10s., three months; Straits, £254. 10s.; English, £251. to £252., f.o.r. Lead: Soft, foreign, £23. 17s. 6d.; English, £24. 15s. Spelter, £43. 15s.; hard,

£34. to £35. Antimony, English regulus, 90%, £45. Aluminium, £150. Nickel, £205., delivered, packages extra. Quicksilver, £22. to £22. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 30s. per unit.

TURPENTINE MARKET REPORT.

Messrs. James Watt and Son, Ltd., of 101, Leadenhall Street, London, E.C. 3, report that the stocks of turpentine on July 12 were: American, 27,217 barrels, compared with 8,899 barrels at the corresponding date of 1918; French, 46 barrels (15 barrels); and Spanish, 370 barrels (1,124 barrels). Deliveries during the week ended July 12 were 1,721 barrels, against 368 barrels last year, and since January 1 34,718 barrels, compared with 13,420 barrels in 1918. The price on Saturday last was 90s. per cwt., compared with 116s. at the corresponding date of last year. September-December delivery was quoted at 91s. 3d., and January-April 92s. 9d.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

There is a decided improvement in demand for heavy chemicals, both on export and home trade account, and values all round are well maintained. Caustic soda, 70%, is still quoted at £17. 10s. for resale lots, and refined bicarbonate of soda at £7. 10s. per ton; 58% alkali unchanged at £6. 10s., ex store. Bleaching powder continues steady for spot lots at £15., softwoods, rails. Hardwoods, about £14., f.o.b. Soda crystals, bags, 82s. 6d., on rails. Chlorate of potash is lower at 1s. 1d. per lb. Soda steady at 7½d. per lb. There is not much inquiry yet for copper sulphate, and export price remains nominally £45., f.o.b. Bichromates are steady at recent rates. Selrooke firm at 60s., in bulk, carriage paid. Recovered rock sulphur, £19. per ton. Phosphate of soda, £25. 19s. per ton. Concentrated hyposulphite of soda quiet at £16. 10s., on rails. Concentrated sodium sulphide easier at £20. per ton, in casks. Nitrite of soda, £55. per ton. White powdered arsenic continues scarce, and small spot lots of Cornish make are still realising £40. per ton. Yellow prussiate of potash quietly steady at 1s. 9d. per lb. Soda appears to have reached the bottom at 7d. per lb., and is moving off fairly well. Acetic acid in good request, and values well maintained. Acetate of soda is in only moderate demand at

£53. per ton. Lead salts are unaltered: White acetate at £85. and brown, £75. per ton. Nitrate lower at £57. per ton. English brown acetate of lime in short supply, and price steady at £10. per ton. American grey higher at £19. 10s. per ton. Green copperas is only selling slowly. For oxalic acid there is a fair inquiry, and price unchanged at 1s. 2½d. to 1s. 3d., delivered.

SWANSEA MARKET REPORT. THURSDAY.

Tinplate prices are rather unsettled owing to the coal situation. Quotations have stiffened, and may be given as between 33s. to 34s. basis for standard boxes. Copper is dearer at £97. 10s. cash and £98. three months. Tin easier at £245. 7s. 6d. cash and £245. 10s. three months. Lead steady: Spanish, £23. 15s.; English, £24. 15s. Spelter, £41. 10s. prompt and £41. 15s. three months. Silver, 53½d. per ounce. Zinc sheets, £65., f.o.b., New York. Aluminium, £150. Antimony nominal: English regulus, 90%, £45. Nickel quiet at £195, including delivery to London or equal. Quicksilver, £21. 5s. per bottle. Sulphate of copper dull: United Kingdom price, £45. per ton, with export at £47., f.o.b. Sulphate of ammonia steady at £19. 10s. per ton over quarter. Nitrate of soda, 22s. 6d. per cwt., in bags. Turpentine, £4. 10s. 6d. per cwt. net. Pitch firm and in poor supply at 51s. per ton. Bone meal, 13s. 6d. per cwt, in bags. Arsenic is rather dearer at £39. per ton for white powdered, in bags, f.o.b. Oxalic acid quiet at 1s. 3d. per lb., f.o.b.

LIVERPOOL CHEMICAL MARKET. THURSDAY.

The demand for chemicals for use in the United Kingdom has been quieter. Business men have been depressed by the increase in the price of coal, coming at a time when all available skill was required to steer business safely through the troubled waters of labour unrest and the uncertainties thrown up by them. Trade was difficult enough to manage, without the new and onerous burden of 6s. per ton on coal.

Bleaching powder has met with a fair inquiry, and is £14. 10s. to £15. per ton free on rail or conveyance, in buyers' packages, and £17. per ton for export. Chloride of calcium has been in quietly steady demand, and is £8. to £11. per ton in casks, f.o.r. Caustic soda has been more inquired for, and is £24. per ton for 76 per cent.; £22. per ton for 70 to 72 per cent., and £19. per ton for 60 to 62 per cent. Nitrate of soda has been in fair demand and is £20. 10s. to £21. per ton. Saltcake has been quieter and is £6. 10s. per ton in casks, f.o.b. Soda crystals have been in rather active inquiry and are £5. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has been steadily called for and is £7. 5s. to £10. per ton, according to terms of delivery. Borax has sold more freely and is £42. per ton for ordinary and £44. per ton for powdered in bags. Ammonia alkali has been in good request and is £6. 5s. per ton, f.o.r. at works.

Hyposulphite of soda continues to meet with a fair inquiry. Ordinary crystals are £19. to £20. per ton, in 2cwt. bags, pea crystals, £25. per ton in 1cwt. kegs. Sulphite also has been in fair demand, and is £11. per ton for ordinary and £18. to £19. per ton for pea crystals in 1cwt. kegs. Bichromate of soda has been quieter and is 9d. per lb. Phosphate of soda has been in moderate request and is £25. per ton. Sulphide of sodium has been more inquired for and is £20. per ton in casks, and £22. per ton, in drums. Chlorate of potash has had a moderate sale and is 1s. 1d. to 1s. 2d. per lb. Permanganate of potash has sold more readily and is 3s. 6d. per lb. Sulphate of potash has been very quiet, and is £40. per ton. Carbonate of potash has been in moderate request and is £85. to £90. per ton for 80 to 85 per cent. Caustic potash continues to meet with a rather active inquiry and is £90. to £100. per ton for 35° Bé. Nitrate of potash has been in somewhat freer request and is £58. to £60. per ton for refined and £40. per ton for ordinary. Canadian ashes have had a very limited sale and are £200. to £220. per ton for first quality, Montreal, and £190. to £210. per ton for second quality. Bichromate of potash has been in moderate demand and is 1s. 6d. to 1s. 7d. per lb. Yellow prussiate of potash has been quiet and is 1s. 9d. to 1s. 10d. per lb. Sal ammoniac has been rather more inquired for, and is £80. per ton for lump; £75. per ton for seconds, and £5. per ton extra for ground. Sulphate of ammonia has been in quietly steady demand, and is £19. 10s. per ton for farm uses or for fertiliser making, less trader's discount of 10s. per ton; free to nearest wharf or railway station; to September 30. Carbonate of ammonia has been but little in

request and is 6½d. per lb. Muriate has been very quiet and is £50. to £60. per ton, according to quality. Magnesia has been in fair demand. Carbonate is £3. 10s. per ton, and sulphate, £10. to £16. per ton, according to grade. Alum has been steadily called for, and is £18. 10s. per ton for the home trade and £18. 10s. to £19. 10s. per ton for export. Aluminoferric has again been but little in demand, and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina has been quiet, and is £12. to £18. per ton, according to grade. Sulphur has been in very fair request. English flowers are £32. per ton; roll is £28. per ton, and rock £22. per ton, in bags, f.o.r. Sicilian kinds are: Flowers £28. per ton; roll £22. 10s. per ton; and third quality £17. 15s. per ton. Cream of tartar has been more in request, and is £11. 5s. to £11. 10s. per cwt. Tartaric acid has met with a fair inquiry, and is 3s. 2d. per lb. Boracic acid has been in moderate demand, and is £72. per ton for crystals and £74. per ton for powdered. Oxalic acid has been in quietly steady request and is 1s. 3d. per lb. Citric acid has again been in fair demand, and is 4s. 4d. per lb. White acetate of lead has had a very limited sale and is £85. to £90. per ton. Arsenic has been in fair request; white powdered has been scarce, and the price has been very irregular. From £42. to £45. per ton is being asked for it. Sulphate of copper has been but little in request for home trade uses, but rather more called for on export account. For farm uses in the United Kingdom, it is £45. per ton, and for export, £47. to £48. per ton, less 5 per cent., in casks, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.

TUESDAY

Chemicals are unchanged, but the demand is very steady, and for home consumption improving. Bleaching powder and caustic soda in good request. Soda crystals locally are steady at £5. per ton, 2cwt. bags. Sulphur continues very scarce and firm at £22. and £23. per ton.

The following prices are per ton, net: Bleaching powders, softs and hards, £15; caustic soda, 74-77%, £23. 5s.; do., 70%, £22.; do., 60%, £20.; recovered sulphur, 2cwt. bags, £23.; hyposulphite of soda, 5-7cwt. casks, £19.; do., 1cwt. kegs, £25.; sulphite of soda, 5-7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75° Tw., £9. 12s. 6d.; do., 100° Tw., £10.; do., 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5.; sulphate of soda (saltcake), in bulk, £3. 10s.; pure white sulphate of alumina, 14-15%, £19. 10s.; blanc fixe, £22.; chloride of barium, £27.; sulphide of sodium, crystals, £18.; do., refined concentrated solid, 60-62%, £25.; hydrate of barium, crystals, £56.

COALS. Market is very unsettled, and operators generally are hesitating to commit themselves until the position is more defined. For the moment Allied schedule quotations are as under: Best Northumberland steam coal, 75s. to 76s. per ton; do., second qualities, 67s. to 70s.; Northumberland small coals, 51s.; do., seconds, 48s. to 50s.; best Durham gas coals, 61s. to 63s.; do., seconds, 50s. to 55s.; Durham bunkers, 55s.; do., seconds, 50s. to 53s.; foundry coke, 70s.; gas coke, 70s.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

There are no distinctive changes in prices as far as the heavy chemicals are concerned, and, generally speaking, business during the past week in the West of Scotland area has been of a somewhat restricted character—with the bigger deal still more or less in the background. The shadow of the approaching Glasgow trades holidays has also had a perceptible effect, and by the time this report appears in print all chemical and other works throughout Glasgow and district will be closed for a period of seven to ten days. Prices remain on the old levels as follows: Arsenic, £40. per ton, net, Glasgow; bicarbonate of soda, £8. 15s. and £10. per ton for 6-8 casks and 1cwt. kegs, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags, and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £24. per ton, net, Glasgow; chlorate of potash, 1s. 3d. per lb., net, Glasgow; chlorate of soda, 10d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 88%, £11. 5s. per cwt., net, Glasgow; sal ammoniac, £80. and £75. per ton, net, any port, for first and second lump respectively; sal ammoniac crystals £85. per ton, net, Glasgow; saltpetre, £3. 5s. per cwt., net, Glasgow; tartaric acid, 3s. 1d. per lb., 5%, Glasgow.

Among the sea oils, business is also quiet, and, generally speaking, the supply is more or less equal to the demand. As far as the whale oils are concerned, neither the pale nor yellow varieties are on offer (a condition of affairs which has now reigned for the past three or four weeks), while the prices of brown and black have advanced to 80s. and 78s., as against the old quotations of 78s. and 76s. respectively. Newfoundland cod maintains its recent rise from 74s. to 75s., and all available quantities of this oil find ready purchasers. The market is still bare of pale seal and Menhaden.

Quiet conditions continue to prevail in the West of Scotland coal trade. The local works are now seemingly getting larger supplies than they can conveniently deal with, and, as a general rule, stocks are well replenished. The position in the home market is greatly assisted at the moment, however, by the better business which is now being done for export; but this is only possible owing to the Coal Controller being more generous in the granting of the necessary permits. Work at the collieries is proceeding satisfactorily, and outputs are being easily disposed of.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

GLASGOW.

Week ending July 12.

CARBON BLACK—
Boston, 30 cs.

GLUE—
Boston, 57 bgs.

IRON PYRITES—
Huelva, 2,950 t.

LACTIC ACID—
Boston, 292 brls.

SOAP—
New York, 100 brls.

WAX—
Boston, 25 bdls.

GOOLE.

Week ending July 12.

NIL.

GRANGEMOUTH.

Week ending July 12.

NIL.

GRIMSBY.

Week ending July 12.

DYESTUFFS—
Dieppe, 550 csks.

HULL.

Week ending July 12.

BARYTES—
Montreal, 105 brls.

FERRO-SILICON—
Gothenburg, 54 cs.

FUEL OIL—
Puerto, 341,127 galls.

LITHOPONE—
Rotterdam, 40 csks.

MAGNESITE—
Christiania, 204 bgs.

ZINC WHITE—
Amsterdam, 10 brls.

LEITH.

Week ending July 12.

NIL.

LIVERPOOL.

Week ending July 12.

ACETIC ACID—
Newport News, 51 brls.

ANTIMONIAL LEAD—
Halifax, 5,937 pes.

ANTIMONY ORE—
Sydney, 10,113 bgs.

COAL PRODUCTS—
Dyes
Philadelphia, 9 brls.

CREAM OF TARTAR—
Oporto, 10 csks.

EXPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

GLASGOW.

Week ending July 12.

AMMONIUM CARBONATE
Calcutta, 1 t.

CHEMICALS (otherwise undescribed)
Auckland, 23 t.; Bombay, 9 t.

CHEMICALS (otherwise undescribed)
17 c.; Delagoa Bay, 50 t.;
Montreal, 1 t. 8 c.; Rouen, 3 t.
2 c.

COAL PRODUCTS (otherwise undescribed)
Antwerp, £2620.; Bombay, £692;
Calcutta, £311.; Colombo, £229.;

COAL PRODUCTS (otherwise undescribed)
Madras, £89.

FERRO-SILICON—
Bombay, 150 t.

FORMALDEHYDE—
Bombay, 4 c.

GELATINE—
Montreal, 1 t. 4 c.

GLUE—
Montreal, 3 c.

IRON SULPHATE—
Calcutta, 9 c.

LITHARGE—

Abadan, 9 t. 11 c.

PARAFFIN—

Rouen, 2 t. 9 c.

PARAFFIN WAX—

Antwerp, £71.; Rouen, 20 t.

POTASSIUM CHLORATE—

Delagoa Bay, 1 t.

RED LEAD—

Auckland, 2 t.; Bombay, 26 t.

SHEEP DIP—

Auckland, 24 t. 18 c.

SODIUM BICARBONATE—

Auckland, 1 t. 12 c.; Madras, 14 t. 1 c.; Montreal, 18 c.

TALLOW—

Colombo, 1 t.

WHITE LEAD—

Auckland, 7 t. 2 c.

GOOLE.

Week ending July 12.

NIL.

GRANGEMOUTH.

Week ending July 12.

ALUM—

Bergen, 11 t.

GRIMSBY.

Week ending July 12.

NIL.

HULL.

Week ending July 12.

BORAX—

Christiania, 1 crt.

10 kgs., 86 bgs.; Wiburg, 100
bgs.

COAL PRODUCTS—

Tar
Dunkirk, 392 csks.

DISINFECTANTS (otherwise undes.)

Alexandria, 12 cs., 70 drms.;
Bombay, 6 cs., 500 drms.;
Dunkirk, 150 csks.

FATTY ACIDS—

Dunkirk, 110 brls.; Rouen, 46
brls.; Rotterdam, 105 brls.

GLUE—

Christiania, 11 cs.; New York,
180 bgs.

SOAP—

Alexandria, 18 kgs.; Gothenburg,
10 cs.; Rouen, 850 cs.

TALLOW—

Alexandria, 6 brls.

LEITH.

Week ending July 12.

AMMONIUM CARBONATE—

Bergen, 3 t., £209.; Gothenburg,
5 t. 18 c., £292.; Trondhjem,
10 c., £32.

BORAX—

Gothenburg, 30 c., £59.

BORIC ACID—

Gothenburg, 3 t. 12 c., £268.

COAL PRODUCTS—

Naphthalene
Dieppe, 24 t. 18 c., £1,051.

MAGNESIUM CARBONATE—

Spain, 5 t. 13 c., £250.

POTASSIUM BICHRIMATE—

Amsterdam, 1 t. 3 c., £183.;
Gothenburg, 1 t. 14 c., £273.;
Rotterdam, 7 c., £50.

SODA CRYSTALS—

Iceland, 5 t. 1 c., £40.

SODIUM BICARBONATE—

Iceland, 4 c., £3.

SODIUM BICHRIMATE—

Copenhagen, 15 c., £124.; Goth-
enburg, 6 c., £33.; Rotterdam,
6 c., £23.

LIVERPOOL.

Week ending July 10.

ACETIC ACID—

Alexandria, 1 c., £11; Algoa Bay,
2 c., £15; Rio de Janeiro, 2 t.
19 c., £207; Santos, 1 t. 17 c.,
£152.

ALUM—

Bahia, 1 t., £22; Quitta, 2 c.,
£3; Rio de Janeiro, 1 c., £7;
Santos, 4 t. 17 c., £85.

ALUMINA SULPHATE—

Christiania, 5 t., £42.

ALUMINA SULPHOCYANIDE—

Rio de Janeiro, 1 t. 1 c., £74.

AMMONIA—

Rio de Janeiro, 2 t., £80.

AMMONIUM CARBONATE—

Algiers, 5 c., £15; Gothenburg,
2 t., £134; Nantes, 2 t., £138;
Natal, 2 c., £7; Pto. Alegre,
19 c., £63; Rio de Janeiro, 3 t.
2 c., £230; Stockholm, 3 t.,
£50; Santos, 5 t. 19 c., £366.

AMMONIUM MURIATE—

Montreal, 5 t. 5 c., £256.

AMMONIUM NITRATE—

Montreal, 55 t. 2 c., £1,375.

AMMONIUM PHOSPHATE—

Christiania, 1 c., £20.

AMMONIUM SULPHATE—

Christiania, 1 c., £27.

ARSENIC—

Bahia, 1 t., £131.

BARIIUM CHLORIDE—

Bilbao, 2 t. 1 c., £57.

BARIIUM SULPHOCYANIDE—

New York, 9 c., £66; Rio de
Janeiro, 10 c., £114.

BLEACHING POWDER—

Alexandria, 8 c., £20; Algoa
Bay, 1 t. 10 c., £27; Bahia,
5 c., £16; Bombay, 8 t. 18 c.,
£144; Calcutta, 20 t., £360;
Durban, 2 t. 2 c., £34; Nantes,
25 t. 15 c., £333; Rouen, 11 t.

- ETHER**—
Alexandria, 2 cs., £12.; Copenhagen, 1 cs. (pt.), £33.; Madras, 5 cs., £95.
- ETHER (METHYLIC)**—
Alexandria, 2 cs., £23.
- ETHER (SULPHURIC)**—
Bombay, 1 cs., £9.
- ETHYL CHLORIDE**—
East London, 1 cs. (pt.), £9.; Oporto, 1 dr., £15.
- FATTY ACIDS**—
Dunkirk, 75 t.; Rouen, 20 t.
- FULLERS EARTH**—
New York, 327 t.; Paris, 10 t.; Santos, 10 t.
- GALLIC ACID**—
Buenos Ayres, 1 cs., £9.
- GELATINE**—
Ostend, 1 t., 4 c.
- GLUE**—
Tientsin, 5 t.; Tokyo, 15 t.; Yokohama, 20 t.
- GLUE, SIZE, AND GELATINE**—
Antwerp, 2 t.; Calcutta, 10 c.; Cape Town, 11 c.; Christiania, 1 t.; Copenhagen, 1 t. 5 c.; Dalny, 15 t.; Dunedin, 1 c.; Durban, 3 c.; East London, 3 c.; Karachi, 4 c.; Malmo, 6 c.; New York, 1 t.; Oporto, 1 c.; Ostend, 1 t. 19 c.; Rabat, 10 c.; Rangoon, 10 c.; Shanghai, 1 c.; Singapore, 7 c.; Sydney, 2 c.
- GLYCERINE**—
Alexandria, 6 c., £51.; Brisbane, 1 c., £8.; Calcutta, 5 c., £48.; East London, 1 c., £8.; Madras, 4 c., £26.; Piraeus, 1 c., £9.
- GLYCERINE**—
Rangoon, 2 c., £17.; Rio de Janeiro, 1 c., £12.; Tampico, 10 c., £56.; Yokohama, 3 c., £33.
- GLYCEROPHOSPHORIC ACID**—
Cape Town, 1 cs., £10.
- GOLD CHLORIDE**—
East London, 1 cs. (pt.), £15.; Melbourne, 4 cs. (pt.), £7.
- HYDROBROMIC ACID**—
Calcutta, 1 cs., £29.; Melbourne, 1 cs., £17.
- HYDROCHLORIC ACID**—
Alexandria, 1 c., £6.
- HYDROGEN PEROXIDE**—
Bangkok, 1 cs., £8.; Batavia, 10 cs., £63.; Cape Town, 4 cs., £31.; Christchurch, 6 cs., £10.; Durban, 3 cs., £18.
- IODINE**—
Antwerp, 1 cs. (pt.), £9.; Calcutta, 1 csk. (pt.), £23.
- IODIFORM**—
Karachi, 1 cs. (pt.), £7.; Port Elizabeth, 1 cs. (pt.), £6.
- IRON AND AMMONIUM CITRATE**—
Shanghai, 1 cs., £46.
- IRON PERCHLORIDE**—
Singapore, 4 cs., £12.
- IRON SESQUICHLORATE**—
Wiborg, 1 csk., £6.
- LACTIC ACID**—
Rangoon, 1 cs. (pt.), £13.
- LEAD ACETATE**—
Rio de Janeiro, 1 kg., £14.
- LEAD CARBONATE**—
Las Palmas, 1 cs. (pt.), £8.
- LITHIUM BENZOATE**—
Paris, 3 cs., £150.
- LITHIUM CITRATE**—
Calcutta, 6 cs. (pt.), £5.; East London, 7 cs. (pt.), £8.
- MAGNESIA (CALCINED)**—
Brussels, 2 csks., £18.; Marseilles, 4 cs., £37.
- MAGNESIUM CARBONATE**—
East London, 1 cs., £12.; Melbourne, 5 cs., £25.; New Plymouth, 1 cs., £6.; Paris, 20 bgs. (F.), £56.; Rio de Janeiro, 2 cs., £10.; Switzerland, 1 csk., £8.; Trinidad, 4 cs., £10.
- MAGNESIUM CITRATE**—
Cape Town, 1 cs., £11.; Calcutta, 6 cs. (pt.), £13.; East London, 1 cs. (pt.), £7.; Port Elizabeth, 1 csk., £9.
- MAGNESIUM SULPHATE**—
Alexandria, 3 c., £6.; Barbados, 5 c., £12.; Bombay, 1 t. 10 c., £53.; Brussels, 5 c., £10.; Karachi, 9 c., £9.; Port Elizabeth, 6 c., £13.; Port Moresby, 3 c., £7.; Rio de Janeiro, 10 c., £15.; Sydney, 5 c., £14.; Toronto, 10 t., £205.
- MANGANESE OXIDE**—
Sydney, 1 csk., £15.
- MERCURY AND AMMONIUM CHLORIDE**—
Durban, 1 cs. (pt.), £5.
- MERCURY ARSENIATE**—
Christiania, 1 cs., £30.
- MERCURY CHLORIDE**—
Paris, 1 cs., £75.
- MERCURY OXIDE**—
Barranquilla, 1 cs., £70.
- MERCURY PERCHLORIDE**—
Rangoon, 1 cs. (pt.), £8.
- MERCURY SUBCHLORIDE**—
Rangoon, 1 cs. (pt.), £8.
- METHYL SALICYLATE**—
Antwerp, 1 dr., £18.; Cape Town, 1 cs. (pt.), £8.; Durban, 1 dr., £7.
- MINERAL BLACK**—
Christchurch, 20 cs., £27.
- NICKEL OXIDE**—
Rotterdam, 42 csks. (F.), £1,500.
- NITRIC ACID**—
Antwerp, 2 t., £75.; Alexandria, 2 c., £5.; Ghent, 3 t. 15., £160.
- NUCLEIC ACID**—
Paris, 1 cs., £306.

OLEIC ACID—
Antwerp, 120 brls., £1,800.

OXALIC ACID—
Calcutta, 2 cs., £12.; Paris, 8 csks. (F.), £270.

PARAFFIN WAX—
Helsingfors, 20 t.; Rotterdam, 20 t.

PHOSPHORIC ACID—
Alexandria, 1 cs. (pt.), £6.; Bombay, 2 cs., £6.; Madras, 1 cs. (F.), £13.; Montreal, 2 cs., £20.; Paris, 60 cbys., £460.

PHOSPHORIC AND CITRIC ACID—
Dunedin, 2 cs., £10.

PHOSPHORUS (AMORPHOUS)—
Bombay, 1 cs., £14.; Durban, 16 cs., £193.

PLUMBAGO—
Piraeus, 1 t. 1 c.; Santiago, 9 c.

POTASSIUM ACETATE—
Calcutta, 1 cs. (pt.), £6.; Christiania, 4 cs., £40.; Karachi, 1 cs. (pt.), £5.; Mauritius, 2 cs. (pt.), £5.

POTASSIUM BICARBONATE—
Adelaide, 2 kgs., £15.; Alexandria, 2 cs., £9.; Melbourne, 5 kgs., £37.

POTASSIUM BICHROMATE—
Bombay, 2 cs., £22.

POTASSIUM BROMIDE—
Dunedin, 1 cs. (pt.), £5.; Valencia, 1 cs., £17.

POTASSIUM CARBONATE—
Cape Town, 1 cs., £6.; Surva, 1 cs., £8.

POTASSIUM CITRATE—
Adelaide, 1 cs., £17.; Alexandria, 1 cs. (pt.), £8.; Dunedin, 1 cs. (pt.), £8.

POTASSIUM CYANIDE—
Karachi, 1 cs., £7.; Madras, 2 cs., £4.; Paris, 5 c., £50.; Rangoon, 1 cs. (pt.), £7.

POTASSIUM FERROCYANIDE—
Bombay, 1 cs. (pt.), £6.

POTASSIUM HYDROXIDE—
Durban, 1 cs. (pt.), £5.; Melbourne, 1 cs. (pt.), £14;

POTASSIUM HYPO—
Paris, 1 cs. (pt.), £5.

POTASSIUM IODIDE—
Amsterdam, 1 cs., £75.; Antwerp, 1 cs. (pt.), £8.; Calcutta, 1 cs. (pt.), £78.; Christchurch, 1 cs. (pt.), £6.; Cape Town, 1 cs. (pt.), £6.; Dunedin, 3 cs. (pt.), £42.; Durban, 1 cs. (pt.), £19.; Melbourne, 1 cs., £20.; Mauritius, 2 cs. (pt.), £36.; Singapore, 4 cs. (pt.), £9.

POTASSIUM METABISULPHATE
Algiers, 8 csks., £405.

POTASSIUM PERMANGANATE—
Bombay, 7 cs. (pt.), £5.

POTASSIUM PRUSSATE—
Havre, 12 cs., £120.

POTASSIUM SULPHOGUAIACOLATE—
Calcutta, 2 cs., £60.; Lisbon, 1 cs. (pt.), £13.

POTASSIUM SUPEROXALATE—
Melbourne, 1 kg. (F.), £11.

POTASSIUM OXALATE—
Melbourne, 1 kg., £11.

PRUSSIAN BLUE—
Hong Kong, 3 pkgs., £50.

PYROGALLIC ACID—
Hankow, 4 cs., £75.

QUININE—
Calcutta, 10,556 ozs.; Durban, 300 ozs.

SALAMMONIAC—
Christchurch, 2 c., £8.

SALICYLIC ACID—
Paris, 20 csks., £303.; Sydney, 2 kgs., £20.

SALTPETRE—
Beira, 7 t., £77.; Bombay, 3 c., £10.; Delagoa Bay, 10 c., £28.; Durban, 10 c., £36.; East London, 13 c., £42.; Galatz, 16 c., £40.; Ghent, 11 c., £33.; Oporto, 9 t. 3 c., £532.

SALTPETRE—
Rio de Janeiro, 15 c., £45.

SHEEP DIP—
Buenos Ayres, 56 t. 5 c., £3,000.; Cape Town, 9 c., £12.; Durban, 7 t. 13 c., £296.; Napier, 22 t. 10 c., £788.; Port Elizabeth, 9 c., £12.

SILVER NITRATE—
Calcutta, 2 cs. (pt.), £16.; Durban, 4 cs. (pt.), £68.; Sydney, 1 cs. (pt.), £16.

SOAP—
Adelaide, 6 c.; Alexandria, 5 c.; Amsterdam, 2 t. 7 c.; Antwerp, 178 t. 12 c.; Auckland, 2 t. 4 c.; Bangkok, 10 c.; Batavia, 4 c.; Barcelona, 2 t. 10 c.; Batoum, 1 c.; Beira, 1 c.; Bermuda, 1 c.; Bergen, 4 t. 10 c.; Beyrout 2 c.; Bombay, 1 t. 2 c.; Boulogne, 8 t. 15 c.; Callao, 7 c.; Calcutta, 1 t. 11 c.; Cape Town, 1 c.; Canton, 1 c.; Colombo, 10 c.; Christchurch, 1 c.; Copenhagen, 15 c.; Cyprus, 2 c.; Demerara, 1 c.; Dunedin, 7 c.; Dunkirk, 16 c.; Durban, 2 t. 10 c.; East London, 2 c.; Gibraltar, 11 c.; Hankow, 1 c.; Havre, 12 t. 10 c.; Helsingfors, 5 t.; Hong Kong, 3 c.; Karachi, 2 c.; Lyttleton, 2 c.; Madras, 16 c.; Melbourne, 4 c.; Monte Video, 3 c.; Napier, 1 c.; New York, 7 c.; Newcastle, 1 c.; Ostend, 11 c.; Paris, 11 c.; Port Swettenham, 3 t. 4 c.; Paramaribo, 1 c.; Penang, 3 c.; Rangoon, 1 t. 15 c.; Rotterdam, 7 c.; St. Kitts, 1 c.; Salonika, 3 t. 6 c.; Shanghai, 1 c.; Singapore, 6 c.; Stockholm, 8 c.; Tientsin, 7 c.; Valencia, 2 t. 2 c.; Valparaiso, 6 c.; Yokohama, 2 c.

SODA ASH—
Athens, 10 t., £74.

SODIUM ARSENATE—
Port Elizabeth, 10 c., £25.

SODIUM BENZOATE—
Calcutta, 1 cs. (pt.), 1 cs., £33.

SODIUM BICARBONATE—
Beyrout, 10 c., £7.; Brussels, 10 c., £6.; Calcutta, 1 t. 10 c., £90.; Canton, 10 c., £15.; Constantinople, 2 c., £11.; Cyprus, 6 c., £6.; Durban, 7 c., £7.; Rio de Janeiro, 3 t. 11 c., £91.; Santander, 7 c., £17.; Shanghai, 14 c., £9.; Trinidad, 5 c., £5.

SODIUM BISULPHITE—
Nantes, 4 c., £10.

SODIUM BROMIDE—
Calcutta, 1 cs. (pt.), £8.

SODIUM CARBONATE—
Hankow, 10 c., £8.; Rio de Janeiro, 10 c., £16.; Shanghai, 16 c., £9.

SODIUM GLYCEROPHOSPHATE
Stockholm, 2 pkgs., £166.

SODIUM HYDROSULPHATE—
Sydney, 1 t., £350.

SODIUM HYPOSULPHATE—
Paris, 15 t., £230.

SODIUM HYPOSULPHITE—
Cyprus, 5 c., £9.

SODIUM IODIDE—
Calcutta, 1 cs. (pt.), £21.

SODIUM NITRATE—
Bombay, 4 cs., £24.

SODIUM PHOSPHATE—
Dunedin, 1 cs. (pt.), £31.

SODIUM SALICYLATE—
Antwerp, 1 cs., £10.; Calcutta, 4 cs., £53.; Cape Town, 1 cs., £7.; Dunedin, 1 cs., £11.; Melbourne, 1 cs., £13.; Montreal, 1 cs. (pt.), £20.; Rosario, 1 cs., £16.; Singapore, 4 cs. (pt.), £5.; Switzerland, 6 cs., £66.; Sydney, 1 cs. (pt.), £49.

SODIUM SILICATE—
Cyprus, 2 c., £5.

SODIUM SULPHITE—
Bombay, 1 t., £40.; Hankow, 10 c., £11.; Sydney, 6 c., £6.; Toronto, 6 t., £300.

SODIUM TARTRATE—
Calcutta, 1 cs., £8.; Rangoon, 1 cs. (pt.), £9.

SULPHUR—
Brussels, 2 t. 5 c., £75.; Helsingfors, 2 t., £60.; Rio de Janeiro, 2 c. (F.), £7.

SULPHUR (FLOWERS)—
Alexandria, 10 c., £14.; Paris, 6 t., £200.

SULPHURIC ACID—
Port Sudan, 3 t., £75.

SULPHUROUS ACID—
Colombo, 4 c., £28.; Madras, 2 t. 4 c., £60.; Port Sudan, 3 t., £15.; Rotterdam, 100 csks., £256.

TANNIC ACID—
Paris, 5 brls. (F.), £57.

TARTARIC ACID—
Brussels, 1 c., £16.; Calcutta, 2 c. (F.), £38.; Cape Town, 3 c., £54.; Christiania, 10 c., £201.; Dunedin, 2 c., £39.; Durban, 1 c., £20.; East London, 1 c., £18.; Jaffa, (F.), £15.; Karachi, 10 c. (F.), £106.; Montreal, 4 t., £1241.; Port Chalmers, 2 c., £39.; Rio de Janeiro, 11 c., £243.; Stockholm, 1 t., £336.; Toronto, 3 t., £958.; Valparaiso, 1 c., £27.

WAX—
Copenhagen, 6 c.; Osaka, 9 c.; Paris, 1 t.; Wiborg, 2 c.

WHITE LEAD—
Antwerp, £3,251.; Calcutta, £366.; Channel Islands, £150.; Christchurch, £17.; Hong Kong, £129.; Paris, £705.; Ponta Delgada, £16.; Shanghai, £463.; Tangiers, £65.

ZINC OXIDE—
Canton, 1 cs., £7.

ZINC SULPHOCARBONATE—
Melbourne, 1 cs. (pt.), £5.

MANCHESTER.

Week ending July 12

ACID—
Antwerp, 5 kgs.

ALUM (CHROME)—
Antwerp, 5 csks.; Stockholm, 5 csks.

AMMONIUM CARBONATE—
Antwerp, 20 kgs.; Gothenburg, 170 kgs.

AMMONIUM SULPHATE—
Antwerp, 200 bgs.

ANILINE OIL—
Rotterdam, 1 drin.

ANTIMONY—
Rotterdam, 1 kg.

CAUSTIC SODA—
Alexandria, 113 drms.; Stockholm, 12 drms.

CARBOLIC ACID—
Antwerp, 20 pkgs.

COAL PRODUCTS—
Carbolic Acid
Antwerp, 20 pkgs.
Tar
Antwerp, £1833.; Melbourne, £17.

DEXTRENE—
Antwerp, 8 csks.

DYESTUFF (otherwise undescribed)
Copenhagen, 1 cs.; Rotterdam, 2 csks.

DYESTUFFS—
Chestnut Extract
Copenhagen, 170 bgs.
Logwood Extract
Rotterdam, 3 csks.

GLUE—
Antwerp, 20 bgs.

HYDROQUINONE PASTE—
Montreal, 1 cs.

MAGNESIA (CALCINED)—
Alexandria, 13 csks.

MAGNESIUM BISULPHITE—
Montreal, 11 csks.

MAGNESIUM CHLORIDE—
Alexandria, 8 drms.

SALAMMONIAC—
Alexandria, 60 cs.

SALT—
Ghent, 4,000 sks.

SHEEP DIP—
Melbourne, 775 drms.

SOAP—
Alexandria, 2 drms.; Antwerp, 636 pkgs., 50 cs.; Sydney, 10 drms.

SODA ASH—
Gothenburg, 815 bgs.

SODIUM BICARBONATE—
Gothenburg, 176 bgs.

SODIUM HYDROSULPHITE—
Melbourne, 5 kgs.

TALLOW—
Gothenburg, 1 c.

TANNIC ACID—
Rotterdam, 3 brls.

WAX—
Alexandria, 1 cs.

ZINC CHLORIDE—
Alexandria, 3 drms.

MIDDLESBROUGH.

Week ending July 12.

CAUSTIC SODA—
Calcutta, 60 t., £1,200.

COAL PRODUCTS—
Disinfectant
Calcutta, 9 t. 1 c., £296.

Naphthalene
Calcutta, 5 t., £90.
Pitch
Antwerp, 1,116 t. 5 c., £3,120.

SALT—
Helsingfors, 92 t., £671.; Karis-
hamn, 156 t., £527.; Faroe
Islands, 347 t., £867.

NEWCASTLE-ON-TYNE

Week ending July 12.

ANTIMONY—
Antwerp, 3 t. 10 c.

BLEACHING POWDER—
Antwerp, 24 t. 18 c.

BORACIC ACID—
Copenhagen, 5 t.

CAUSTIC SODA—
Copenhagen, 4 t. 18 c.; Rotter-
dam, 10 t. 3 c.

GELATINE—
Copenhagen, 11 c.

GLUE—
Archangel, 10 t.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ...	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Exprot, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3960, Central.

Our Manchester Address is Barton House, 66, Deansgate.

NEW ARRANGEMENTS.

The "Chemical Trade Journal" will be published in future a day earlier.

SUBSCRIBERS to whom the Journal is posted direct will therefore receive it each week on Friday.

THE TRADE will in future be able to secure their supplies from our London office, 265, Strand, at 10 a.m. on Fridays.

EDITORIAL NOTICES.

INDEX.

Copies of the Index to Volume LXIV. (January-June, 1919) of the "Chemical Trade Journal and Chemical Engineer," which is now available, will be forwarded to those readers who make early application to the Publishers.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

CURRENT TOPICS.

THE COAL CRISIS.

THE term crisis is no exaggeration when used to describe the present position of the coal industry, and indeed it may be applied more generally to the whole trade of the country. The state of affairs now existing is one that must shake the confidence of the most optimistic among us, and what makes the situation more serious is the fact that no break in the clouds anywhere is visible.

Britain's commercial supremacy in the past has been due in large measure to the cheap and abundant supplies of coal that have always been available, and if production increases, as we are told it must if we are to maintain that position, more coal will be needed. Yet, what do we find? In 1913 the total production in the United Kingdom exceeded 280,000,000 tons, whereas in the last year for which statistics are available only 220,000,000 tons were produced. Worse than that, the output is falling rapidly, and no great stretch of imagination is required to picture the state of affairs that must ensue. Granted that the use of coal has been most wasteful in the past, no possible economies can make up for the falling output, and all industries requiring a large proportion of fuel in relation to their production, such as the chemical and the iron and steel trades, will be placed in a parlous position.

Now, it seems to us that there has been no adequate attempt to keep prominently before us the fundamental causes of the present unrest. It is not due to differences as to the application of the Sankey Award, nor the retention of conscription; neither is it the six-shilling increase in the price of coal. The real cause lies much deeper than this, and has its roots in the Syndicalist propaganda preached in South Wales in particular long before the war. As our readers are aware, the doctrines of M. Sorel have for their object the rendering unprofitable of all private enterprises so that the "workers" may

eventually seize them for their own exclusive benefit. These doctrines remained more or less dormant during the war, but the revolutionary faction are now taking advantage of the declaration of Peace to proceed with their carefully concerted plan to bring the Government to their knees and to overturn the existing order of things. Concessions to the miners are useless at the present juncture, and the only alternatives we can see are capitulation or a stand-up fight, and the latter is the only one that will in the end bring industrial peace.

EMPIRE SUGAR PRODUCTION.

THE preliminary report of the Empire Sugar Supply (Technical) Committee, presented at the annual meeting of the Society of Chemical Industry, and the ensuing discussion, have thrown a good deal of light on a subject of more than passing interest, and we hope will have useful practical results. The consumption of sugar within the British Empire has been put at approximately $6\frac{1}{4}$ million tons, and the production at $3\frac{3}{4}$ million tons, leaving a deficit of $2\frac{1}{2}$ million tons. In order, therefore, to make the Empire self-supporting, so far as sugar supplies are concerned, an increase of nearly 70 per cent. in the production is essential. To effect this will obviously not be easy; but during the past few years there have been far more difficult problems to be solved—rendered doubly difficult because time was a factor to be reckoned with,—and we are optimistic enough to believe that with adequate assistance from the Imperial Government and the Government of India—for India certainly presents the greatest possibilities for rapid development—success would be met with if a carefully co-ordinated scheme were proceeded with. Even with the almost primitive methods largely in vogue, India produced in 1915 about 3,000,000 tons of sugar. With improved cultivation, more efficient machinery, and large centralised factories, it is authoritatively estimated that the output could be more than doubled. India alone, therefore, is potentially capable of supplying the needs of the Empire. There are many other sources, however, also capable of development, including the cultivation of sugar-beet in our own country. In composition and purity roots grown here have been proved to be superior to Continental varieties; the obstacle at the present time lies in the failure, owing to the methods of cultivation, to produce roots of the desired shape. That should not prove difficult to overcome. In all these schemes for development, however, the question of capital is paramount, and to render the sugar industry attractive to capital adequate preferential treatment to British Empire producers must be accorded.

COMPRESSED ACETYLENE.

AN Order of the Secretary of State, dated June 23, sets forth the conditions under which compressed acetylene contained in a porous substance may be exempt from the operations of the Explosives Act, 1875. Details of the Order, which comes into force on August 1 next, cancelling a previous Order of August 6, 1912, are as follows:—

Acetylene when contained in a homogeneous porous substance, with or without acetone or other solvent, shall not be deemed to be an explosive within the meaning of the said Act subject to the following conditions, and so long only as such conditions are observed, viz:—

(1) The porous substance shall be similar in every respect to a sample deposited with His Majesty's Inspectors at the Home Office.

(2) The porous substance shall fill as completely as possible the cylinder into which the acetylene is compressed.

(3) The porosity of the substance shall not exceed 80 per cent.

(4) Any acetone or other solvent used shall not be capable of chemical reaction with the acetylene gas or with the porous substance or with the metal of the cylinder, and the quantity of acetone or other solvent used shall be such that when fully charged with acetylene it shall not completely fill the porosity of the porous substance at any temperature likely to be met with in ordinary practice or use.

(5) A drawing showing the method of construction of every type of cylinder it is proposed to use for the storage of compressed acetylene gas shall be deposited with H.M. Inspectors of Explosives at the Home Office, and no cylinder shall be so used unless it is of a design approved in writing by one of the said inspectors, provided that this shall not be deemed to prohibit the use of existing cylinders for a period of five years from the date of this Order.

(6) The pressure in the cylinder shall not exceed 225lb. to the square inch at a temperature of 60° F., provided that no cylinder capable when empty of containing one cubic foot of water or more, which has the ends secured to the body by welding only, and no cylinder in which a porous substance is used without acetone or other solvent, shall be charged to a pressure exceeding 150lb. to the square inch at a temperature of 60° F. This condition shall not apply to cylinders used exclusively for marine lighting by a general or local lighthouse authority within the meaning of the Merchant Shipping Act, 1894.

(7) Every cylinder capable when empty of containing one cubic foot of water or more, in which under this Order the pressure allowed may be 225lb. to the square inch, shall be annealed and every cylinder shall be tested by hydraulic pressure to a pressure of not less than four times the pressure to which the cylinder is to be subjected in use, such hydraulic pressure to be maintained for a period of not less than fifteen minutes, and no cylinder shall be used which on the first occasion of its being subjected to this test shall show any permanent stretch.

(8) The compression of the acetylene shall be carried out only on such premises as shall have been approved in writing by one of His Majesty's Inspectors of Explosives. Such approval may be withdrawn at any time by one of His Majesty's Inspectors of Explosives.

(9) No firm shall charge with acetylene any cylinder manufactured by any other firm unless it is in possession of the full particulars and previous history of such cylinder, or has otherwise assured itself that the cylinder complies with the requirements of this Order.

(10) Whenever a cylinder is charged with acetylene it shall be subjected to a thorough visual examination if the history of the cylinder shows that it has not been subjected to such an examination within the previous twelve months, and at the same time the valve shall be removed and the condition of the porous substance at the neck of the cylinder ascertained.

(11) Every cylinder shall have permanently and conspicuously marked upon it or upon a brass plate soldered to it the name of the manufacturer and the words "Acetylene compressed into porous substance exempted by Order of Secretary of State." And every cylinder shall bear a label giving the date when it was last charged, together with the name of the firm by whom it was charged, the address of the last charging station and the maximum pressure allowed in the cylinder. Every cylinder capable when empty of containing one cubic foot of water or more manufactured after the date of this Order shall have stamped upon it the name or trade mark of the manufacturer and the serial number of the cylinder.

(12) Each charging firm shall keep a record of every cylinder charged by it. This record shall give the following information:—In the case of cylinders first issued by the firm: (a) the tare weight of the cylinder, including porous substance and acetone or other solvent, the nature of the solvent, and the maximum pressure allowed in the cylinder. In the case of all cylinders charged: (b) The date of each charging of the cylinder. (c) The dates upon which the solvent has been added. (d) The dates upon which the cylinder has been thoroughly examined as provided in Regulation 10, the results of each such examination, and the name of the person carrying out such examination. The record shall be open to the inspection of His Majesty's Inspectors of Explosives.

(13) Every facility shall be given to His Majesty's Inspectors of Explosives to inspect the apparatus and methods by which the cylinders are charged.

SOCIETY OF CHEMICAL INDUSTRY.

ANNUAL GENERAL MEETING.

(Continued from page 62.)

SUGAR PRODUCTION.

ON Wednesday, July 16, a conference was held at the Clothworkers' Hall, Mincing Lane, on the "Production and Consumption of Sugar Within the British Empire," when the preliminary report of the Empire Sugar Supply (Technical) Committee was presented. Lord Denbigh, C.V.O., presided.

The report was presented by Mr. Arthur R. Ling, chairman, and Mr. J. W. Macdonald. We give an abstract below:—

The sugar cane as now cultivated under the most favourable conditions gives a crop of 30-40 tons per acre, and sometimes more, and has a sugar content of 11-16 per cent. Taking a yield of cane of 35 tons per acre, and an extraction of sugar of 12 per cent., this, says the report, would mean a production of sugar of 4.2 tons per acre. In 1909 the world's production of beetroot sugar was 6,588,000 tons, or 44.3 per cent. of the total sugar production from cane and beet together. Of this Germany produced 2,080,000 tons. The remarkable success met with in Germany in improving the sugar content of the roots by selection and manuring may be judged by the fact that at the commencement of the industry the roots probably contained not more than 6-8 per cent. of sugar, whilst the sugar content had steadily improved until the roots of the 1909 harvest contained an average of 17.63 per cent. of sugar. Of this over 90 per cent. would be secured by modern methods.

It will be seen that the sugar content of beets is higher than that of cane, but the crop is a lighter one. On an average, under the best conditions, about 12 tons of beets can be grown to the acre, so that the yield of sugar seldom reaches 2 tons per acre, and is generally a little below it.

The British Empire, according to the last returns, had about 3,500,000 acres under sugar, mostly cane, yet the total production from this was less than that of Germany and Austria-Hungary combined, which countries could not have had as much as half that number of acres under beet. Obviously, there must be something wrong with our methods.

Let us bear in mind that the British Empire exceeds all other States in the production of sugar, yet the United Kingdom occupies the second place, coming next to the United States, as an importer of sugar. It is of particular significance in connection with this last-named fact that prior to the war more than 90 per cent. of the sugar imported into the United Kingdom came from foreign countries, and by far the greater portion of this (quite 90 per cent.) was European beet sugar.

Since the outbreak of hostilities the production of sugar from beet has dropped from 46 per cent. to 29 per cent. of the world's total supply. On the other hand, the production of the British Empire has increased from 3,275,500 tons in 1913-14 to 4,394,100 tons in 1917-18, whilst the total production of sugar throughout the world, which was 18,653,100 tons in 1913-14, was in 1917-18 17,556,400 tons. The country showing the largest increase of any is Cuba.

One of us (A. R. Ling) has a record of the investigation of 375 samples of sugar beets, grown in different parts of the United Kingdom. In these the average weights of the roots and of the leaves have been taken, the percentage of sugar in the roots and juice, and the coefficient of purity of the juice, i.e., the percentage of sugar in the other soluble constituents. The results show that the roots are in composition and purity superior to the average grown on the Continent. There is, however, another most important factor from the sugar producer's point of view, and in this respect the majority of our home-grown roots are defective. Some of them are globose in form, some are bifurcated, whilst many of them contain huge fangs and tails. The shape is, in the majority of instances, so faulty that it would be difficult, if not impossible, to deal with many of them in the sugar factory. Until greater attention is bestowed on the culture of sugar beets to meet the needs of the sugar producer we cannot assert that sugar beets can be grown in the United Kingdom equal to those furnished on the Continent. Deep ploughing is, of course, possible in this country, but as this has not been

carried out hitherto the sub-soil may for some considerable time exercise a deleterious effect on the roots.

The report goes on to review at some length the position of the various parts of the Empire in regard to sugar production. Regarding the Indian Empire, which in 1915 produced 2,600,000 tons of sugar from cane, and about 500,000 tons from palm, the report says:

The most feasible means of extending the sugar industry in India is by the establishment of central factories in which all interested in the manufacture co-operate, and are bound by legal contract to assist one another. The factories must be fitted with up-to-date power mills, vacuum evaporating plant, and other modern machinery. This would naturally necessitate considerable organisation and research, and the outlay of much capital. The Indian sugar industry greatly needs capital to extend it. Mr. Wynne Sayer is of opinion that the capital necessary for the development should be forthcoming, in view of the assistance available from Government sugar experts, which has made it possible to overcome many obstacles which formerly obstructed progress.

Mr. J. W. Macdonald said that the report disclosed the fact that the Empire was consuming about 6½ million tons of sugar annually, whilst at the present time the Empire production was about 3½ million tons. Where was that to be produced in order that we might be self-supporting in the future? No doubt some of them had seen a pamphlet issued by the West Indian Committee saying that the West Indian group could produce all that the Empire wanted; because Demerara could produce 2½ million tons, which was exactly the amount the Empire was short of to-day. It might be true that Demerara could and would produce it if the settlement were there; but what a long time it would take to wait for that! If we waited for that we should be flooded with foreign sugar. What we wanted to do was to get sugar where it could be got best and cheapest—where labour was to be had, and other natural conditions were favourable. India was a very important factor in this question. The difficulties there were very great; the land was held by small people, each of whom worked his own little plot, and produced his own sugar for his own consumption. In one way or another, the Indian peasantry wasted two-thirds or three-quarters of the sugar that the land might produce; but they were satisfied, and it was difficult to shift them. If the Government of India educated their people into more efficient methods of making sugar, he believed there were great possibilities, although it would take time. It seemed to him that India was the place to get sugar quickly. The sugar could be grown there, the labour was there, the cane made its own fuel, and there was any amount of land. The thing which frightened him was the enormous cost of the factories, which was about three times what it was pre-war, and unless there were to be big profits, guarded by protection or preference until these big costs were paid off, he did not think people would care to put money into the industry. At present in India most of the sugar was grown in the North, where they planted a thin cane, and got only one ton of sugar to the acre. In the South, where they planted a thicker cane, they got, with their primitive methods, 2½ tons of sugar to the acre, but with better cane and better methods, instead of 2½ they would get 5 or 6. He did not think we in this country could compete with Indian cane sugar by growing beet. Although we might make a small amount of sugar, he did not see how we could spare the land to produce the two million tons of sugar we were actually importing.

Sir Francis Watts, Director of Agriculture for the West Indies, speaking of the needs of the United Kingdom, asked how the two million tons required were to be found. India might be left out, as for the moment she was an importing country. Australia, Fiji, and New Zealand might be left out; they were not exporting countries. Canada was an importing country. What remained? There were but few British tropical countries left that still produced sugar. Why? Because the condition of the sugar industry had been such that no people would venture to put money and machinery into the parts of the British Empire where sugar could be produced. Whether we could by a vigorous effort, well thought out in this country, produce Empire sugar, rested with the

politician. From the very beginning sugar had been the sport of politics, and those countries which had built up their sugar industries into a powerful position had done so on a political basis, while this country had destroyed its sugar industry on a political basis. He might be told that it was under discussion now, and probably would be acceptable to this country, to give a preferential treatment to British-grown sugar to the extent of £3 or £4 a ton remission of duties. That meant that British-grown sugar coming in to-day or next year would receive preferential treatment to the extent of £3. or £4. Therefore, it was estimated that the British producer would get that much advantage in the price of sugar. But it was not quite sure that he would. The working out of preferential treatment in other things was often obscure, and it appeared that the preference which was supposed to go to the producer often stuck midway, and did not reach him. Even with the present stress and need he (the speaker) did not look for more than three-quarters of the preference to find its way to the producer. If it did, to what extent would it stimulate the investment of new capital? To a very moderate extent. He believed the intention of granting that preference was to stimulate investment; but for a preference to stimulate investment in a business whose unit of time was three years, there must be some assurance that the benefit would extend over ten or fifteen years. No man could invest in a sugar factory, because for the next two or three years he might make large profits, and for the next ten or fifteen years a bare margin. If this preference was capable of being assured for a considerable period of time, people would invest, and there would be British sugar. If it were not assured, this market would get most of its nearly two million tons from benevolently disposed but none the less foreign competitors.

Dr. Voelcker said he hoped the Committee, before finally adopting its report, would see its way to modify the opinion expressed in it that there was very little value in carrying out experiments to test the respective yields of mangolds, swedes, and beets. Though these might not be of much value to the manufacturer of sugar, they were all important to the agriculturist, because they resolved themselves into a question of which crop paid best, having regard to the residue from the beet factories for cattle feeding, the employment of labour, and so on. At the same time, important though they were, all these questions were subservient to the main question, which was a political one. What was going to be the agricultural policy of our Government in the future? Were we going to aim more and more at being a self-supporting country, or were we to be dependent on other countries—our Colonies and elsewhere,—and look to the Navy to protect our shores?

The Chairman thought the question which had to be solved was whether it would not be more profitable to have less grass land and more land under cultivation. Then the growing of sugar beet would not mean the growing of less wheat.

The conference adjourned for lunch.

Mr. J. W. Macdonald presided at the afternoon sitting.

Mr. A. R. Ling, chairman of the Sugar Committee, referring to Mr. Macdonald's remarks during the morning, said that that gentleman had rather pinned his faith to India.

The Chairman said that was not entirely the case. His point was that India was a large producer already, and as she had the labour and the land under cultivation, an attempt should be made to improve methods, so that a larger output could be obtained.

Mr. Hamel Smith said that 25 per cent. of the juice never came out of the cane in India, and another 25 per cent. was lost in manufacturing, so that as India produced three million tons of sugar last year, she could apparently produce another 1½ millions by not wasting.

Mr. Sandbach Parkes said he was mainly interested in British Guiana, where the possibilities were immense, but the difficulties were very great, mainly for the reason that there was no labour. Sugar was indigenous almost throughout the tropical belt of the British Empire, and it was a question of obtaining security for the industry. Then capital would be attracted, and the necessary labour obtained. The point to be considered was where we should get the best value for the capital invested in the industry. This might be in Africa, where land was cheap and labour plentiful. Although India manufactured sugar in a very uneconomical way, and the yield could be considerably increased, it would take some years to double the yield and to export in any considerable quantity, because India at present imported 800,000 tons of sugar for her own consumption.

Sir Alfred Chatterton gave a brief account of the primitive methods adopted in India and urged the need for the intro-

duction of mechanical appliances, whilst difficulties of transport were also very great.

Professor Carmody, who has been connected with Trinidad for many years, said the fact that the British sugar industry remained firmly established in spite of the severest, most unfair, and most strangling competition that any industry ever had to face, was remarkable, and at the same time encouraging. It was immaterial whether the 2½ million tons which were required were produced from cane or beet, but having an established cane-sugar industry within the Empire, it seemed to him that expenditure would be most profitably incurred upon that. He agreed that India was a country which was likely to produce results much earlier than any other part of the Empire. The great needs were capital, machinery, and, to a certain extent, scientific assistance; whilst transport was a very serious question.

Mr. Ling, speaking on the question of the relative merits of cane and beet sugar, said that he held no brief for beet. If the sucrose could be got from cane, he was quite agreeable to it being done. But no compound had been submitted to such numerous and far-reaching physical tests as sucrose, whether derived from cane or from beet, and when refined to the extent that it was by Tate or other refiners, there was no doubt that cane and beet sugar were practically identical. There was no recognisable impurity in the beet sugar. He preferred the sugar made from cane, but there was no doubt that from many points of view there was much to be said for beet sugar, and when refined as it was to the extent of 99.9 per cent. or more, it was the pure sucrose.

Dr. Thorne, who said he had never been connected with sugar producing, but had had a great deal to do with refining and using of sugars produced in various countries, believed we might look forward to producing within the Empire all the sugar that was wanted, within a comparatively short time, if we put our backs into the matter. After India, we should consider British Guiana, because although India might be capable of producing another two million tons, she would soon be wanting that for her own consumption. If, therefore, attention was paid also to British Guiana, supplies from there should be available by the time India was consuming her own additional production.

Mr. Martineau, as a refiner, confirmed Mr. Ling in saying that refined beet was as good as thoroughly refined cane; in fact, he would rather refine beet than cane. At the same time, he did not want to see Austrian or German beet here again, and he hoped his work in future would be to refine sugar cane only, and he preferred any of our Colonial raw sugars to that from either Cuba or Java. Speaking on the question of research, as honorary secretary to the British Empire Sugar Research Association, he said that body, which had been given encouragement by a Government Department and promises of help, was now a live association, and was backed by thirteen powerful sugar trade associations. Thus the new Research Association represented millions of capital and thousands of firms. The Department of Scientific and Industrial Research had approved of the memorandum and articles of association, the council had been elected, and a start would be made at once. The aim of the Association was "to establish in co-operation with the Government Department of Scientific and Industrial Research, an Empire scheme for the scientific investigation, either by its own officers or by universities, technical schools, and other institutions, of the problems arising in the sugar industry, and to encourage and improve the technical education of persons who are or may be engaged in the industry."

Dr. Bywaters said he would like to know what would be the prospects of dealing with beet sugar in the Colonies. One gentleman had said that he hoped he would never be called upon to refine beet sugar again. That did not sound very promising for the beet-sugar industry of our own country. When one compared the wages now demanded by labour in this country with what were paid to an Indian, he wondered whether there was any hope at all of establishing a beet-sugar industry in our own country.

Mr. Martineau said that when he said he hoped he would never have to refine beet sugar again, he was referring to the flood of beet sugar that we used to get from Germany and Austria. If an English beet-sugar industry was going to be started, he would be glad to encourage it in every way he could. On the other hand, he felt he would rather invest money in growing cane sugar in the Colonies than in growing beet sugar here.

Mr. Sandbach Parkes said that, although a West Indian sugar grower, he was not opposed to the introduction of a beet-sugar industry in England; but he was very doubtful if it could compete with cane sugar grown under proper aus-

pices in the Colonies. It should, however, be given a chance to show whether it could be developed into a paying crop in this country. It would be a sound transaction for the Government to introduce it on a small scale, and see whether it would be a valuable agricultural addition to the crops of the country.

The Chairman, replying to some of the questions raised in the discussion, said that in all the returns the committee had got, only two countries referred to beetroot; these were Victoria and Canada, and neither gave a rosy account of their work. He supposed the industry paid because there was Protection there; but, apart from that, the report was not very good. For instance, in Victoria in 1912 they only got 5.3 tons of root per acre—that was about one-third of a ton of sugar per acre. At another time they got twelve tons of roots, or 1½ tons of sugar to the acre. From Canada the report was that they were cultivating from 14,000 to 18,000 acres in Ontario. There was a large amount of land available suitable for beet, but the conditions were not economically favourable for the extension of factories without assistance from the Government. It was stated that one factory had actually closed because some fiscal facilities that had been given by the Government had been withdrawn. He was afraid the report would not help them much as regards beet, which he believed would always be beaten by the cane sugar. With regard to India, if she produced sufficient only for her own consumption it would liberate large quantities for elsewhere. For instance, Mauritius made between 200,000 and 300,000 tons and practically all of it went to India. It would help very much to get that here. Another point was that fuel was very important in beet-sugar making, but cane supplied most of its fuel. Not only did the bagasse provide fuel for power, but also for heat to evaporate the juice. Nearly all the reports the committee had received complained of the lack of labour, and high freights. Those were the reasons why the industry did not develop.

A conference on "Dyestuffs, Synthetic Drugs, and Associated Products" was held at Salters' Hall on Thursday.

Dr. Rée, who was in the chair, said the first paper was by Dr. H. Levinstein, who, it should be conceded, knew more about the subject of dyestuffs than anybody in the country.

THE BRITISH DYESTUFF INDUSTRY.

Dr. Levinstein said he did not propose to give a panegyric on the war work of the British industry, though that was quite remarkable. Such reviews had a tendency to make one complacent and to encourage the fatal notion that we could for the moment relax our efforts. Nor did he propose to say anything about our present position and future intentions except this: The industry now operated on a large scale, for the British Dyestuffs Corporation, the principal manufacturers, already employed close on 7,000 persons, and some 300 academically trained chemists, exclusively in the manufacture of dyes and auxiliary products, and their works comprised about 1,050 acres. Further large extensions were in preparation to both research laboratories and plant, and he anticipated that before the end of this year the number engaged would be substantially increased, with a corresponding increase of output. The range of products manufactured was being enlarged as quickly as new construction permitted, and our immediate object was to manufacture, in the shortest space of time, a range of dyes sufficient to render the country substantially independent of German dyes.

As the Government, who have a substantial holding in the British Dyestuffs Corporation, had in many ways shown their determination to secure a dye industry here, it was important that everybody should thoroughly understand the facts which make a successful dye industry of paramount importance to the State. He proposed, therefore, to deal with those aspects of the dye industry which explained why any British Government might well feel uneasy until we possessed a dyestuff industry equivalent to that of Germany. There were four reasons why the success of the dye industry was vital to the State. First, the dye industry was a key industry—an over-worked word which now conveyed nothing to a good many people. It might be said that our textile trades did exceedingly well up to the time of the war, though dependent upon Germany for a supply of dyestuffs; and that now the war was over there was not the same necessity for rendering ourselves entirely independent of Germany for the supply of these products. That view would be, however, entirely erroneous. It was held by no one who was at all familiar with the methods and history of the big German aniline dye trust,

which was created in 1915. The negotiations for the gigantic combine were well advanced in August, 1914, and their conclusion was not, as was generally supposed, due to the war, but the carrying out of a policy long decided upon. Had the war come but a little later the ring would have been closed, and our textile industry would have appreciated an acute difference in the conditions under which they would have received their supplies. To-day this trust, familiarly known as the I.G., was the most powerful weapon possessed by the Germans, for in peace, as in war, it was and is a tool of the German Government.

It was inconceivable that we should voluntarily permit the I.G. to dictate to essential industries the terms on which they should obtain their dyes, that we should leave to the I.G. the power to withhold supplies of useful or even essential commodities, or to charge British consumers a higher price than they charged their own textile trades. The real danger of being dependent upon Germany for dyestuffs, however, did not lie in the risk that we might be cut off from supplies in the case of a war with Germany, but that the world-monopoly possessed by Germany in dyestuffs was imperceptibly becoming a desperate menace to the freedom of our textile trades.

Secondly, the dye industry was required for national defence as a guarantee of peace. During the war the I.G. produced not only all the synthetic ammonia and nitric acid needed for the production of explosives, and also vast quantities of explosives, but also, with an unimportant exception, the whole of the chemical warfare products used by Germany in the course of the war. It was entirely due to the I.G. that Germany was able, in spite of the blockade, to carry on the war after the end of 1915. But for the possession of her dye industry, the German resistance would have broken down in little more than a year for lack of nitric acid. Could anything more clearly prove the military value of the German dye industry and the loss and destruction which it had caused us?

The Germans also were, of course, fully conscious of the value of their war factories for the purposes of peace, and far the greater part of their war expenditure on chemical plant was of a permanent character, and erected with a view to the after-war commercial struggle. The plant erected in Germany for the increased production of mustard gas was now available for the increased production of dyes. Attached to one of their plants erected during the war, ostensibly solely for the purpose of war, were laboratories which contained a large luxuriously equipped lecture-room, and cost £200,000.

Thirdly, very few people realised to what a small extent new industries arising out of new inventions had been created in England in recent years in comparison with those created abroad, particularly in Germany. On the whole, that country would produce the most chemical inventions which had the greatest number of trained research chemists. There was no industry except the dye industry which could support a large number of organised research chemists. The dye industry was thus a key industry in a new sense. It was the key to invention.

Fourthly, there was the political importance of the dyestuff industry. The German dye industry was the most potent weapon possessed by Germany for peaceful penetration. In America Mr. Mitchell Palmer showed that the dyestuff sales organisation of the I.G. firms was used by the German Government for espionage both before and during the war. The peaceful penetration of Russia and other foreign countries by Germany was one of the causes which led to the war. It was not safe for us to permit the Germans to monopolise the up-country business with tins of dyestuffs among the natives of India and of the East in general for political reasons. It was our duty to afford an alternative supply of dyestuffs, besides German dyestuffs, to those of our Allies who did not possess an adequate home industry. To secure commercial freedom for our textile trade and that of our Allies was as important as to secure political freedom.

It followed from what he had said that enormous responsibility rested upon the chemists of this country. During the war they rendered good service and made sacrifices and ran risks, but let them be quite clear on this: The real burden of the war was not borne by chemists, and the victory was not won by chemists or by engineers, but by the indomitable courage and tenacity of our soldiers. The real war work of our chemists lay before them, for it rested with chemists to secure in the next few years the opportunities the soldiers won for us, the fruition of which German chemists might yet deny us.

The discussion on Dr. Levinstein's paper was taken in conjunction with the following papers:—

"CERTAIN COLOUR PRODUCING INTERMEDIATES."

By PROFESSOR G. T. MORGAN.

This paper contained a summary of work carried out at the Finsbury Technical College during the past three years, and illustrates a well-worn theme which should not be forgotten, even in the midst of international peace—viz., the close relationship between synthetic dyes and military explosives. In connection with the methylation of aromatic amines, it was previously known that polymerised methylene aniline, a condensation product of aniline and formaldehyde, yielded on alkaline reduction a certain proportion of methylaniline, but the process presented certain practical difficulties. An improvement was effected by causing formaldehyde and aniline to interact in the presence of excess of reducing agent, so that the nascent methylene aniline was reduced immediately to methylaniline. The success of this chemical change depends very largely on the thoroughness with which the reagents are mixed together. A machine devised for this purpose is on view at the British Scientific Products Exhibition by permission of the Chemical Warfare Committee. The reaction was found to be a general one, and was applied to the homologues and derivatives of aniline. Details are given of experiments with the acyl derivatives of methylarylamines, which indicate that experiments initiated to produce improvements in the manufacture of explosives have led to suggestive results in the production of colour intermediates. Acyl derivatives can be initiated and reduced successively to yield colour producing intermediates. Tetryl can, moreover, be prepared by an entirely different process starting from the well-known colour intermediate, chloro 2 : 4 dinitrobenzene. This compound, heated with methylamine hydrochloride in the presence of an alkali such as sodium or calcium hydroxide, is converted into 2 : 4 dinitro-methylaniline, the nitration of which yielded tetryl. The practical difficulty of manufacturing the methylamine hydrochloride required has been overcome, and this salt can now be produced on a commercial scale. With the acid of this reagent (kindly supplied by Messrs. Claus and Co., Manchester) Mr. F. P. Evans and the author have obtained methyl *p*-naphthol by an alternative method by *p*-naphthol, so that this hitherto imperfectly studied secondary aniline can now be prepared by the alternative methods based on formaldehyde. The acyl and other derivatives of this base are now under examination. Chlorodinitrobenzene also interacts readily with aqueous or alcoholic ammonia, giving rise to 2 : 4 dinitroaniline—a primary base not hitherto largely used in colour making.

Para-nitrated diazophenols were also dealt with in the paper, and various effects are referred to in producing dyes by reactions not hitherto employed. The author concludes by saying that this passing reference to work of theoretical interest might serve as a reminder that continued success in the exploitation of synthetic dyes and other fine chemicals is dependent on an enlightened appreciation of investigations and speculations which are not capable primarily of industrial application.

"DYES AND BRITISH TEXTILES."

By JAMES MORTON.

In spite of all our early-war resolutions to use no more colour from Germany no matter almost what should befall us, the peace has somehow brought a tempered attitude. Users are inclined to risk the future of dye-making in this country, to the extent at least of allowing in their own particular requirements. The Government also have to take a wide view of the situation, and, in spite of their desire to foster the making of dyes, cannot afford to ignore the urgency of maintaining our export trade in textiles, both as to quantity and quality. The textile trade is, as it were, up in new alarm, and is looking with more than longing eye at these German colours over the wall. For we might as well admit at once the fact that the war-fervour attitude of having no dealings with Germany after the war is already broken down. The Allies are even now tumbling over each other in Cologne and elsewhere to effect sales of their wares—French, American, and British alike,—and it is only folly to think the trading can be on one side only.

We are therefore met with three separate interests to satisfy, all necessary for the national well-being, and our problem is whether we can find a solution that will meet all the conditions. The first interest is the maintaining of our

supremacy in the textile trade. The second is that of dye-making in this country, and its development on lines that will justify the effort and capital already expended, and enable it to stand on its own legs as a sound commercial industry. The third interest to satisfy, and one that embraces both the above, and without which neither would be of much value, is national security.

Now how are all these partially conflicting interests to be met? Is it possible to devise a plan that will not fall foul of any of them? There are three obvious policies. There is first the opening of the gates free and wide with the fullest opportunity given for Germany to sell and users here to buy at their discretion. Secondly, there is the raising of tariff walls and the indiscriminate boycotting as far as possible of the import of German dyes. Thirdly, there is the method of control of imports—the temporary control of imports—with a temporary subsidy that would give time for the British effort to have a fair run for its life.

To open the gates at this juncture would have the obvious effect of arresting dye-making at its present stage, and administering such a blow that it would probably never be able to stagger on to its legs again. On the other hand, it would be equally disastrous to the other interest—that of the textiles—to raise indiscriminate tariffs, and put our manufacturers at so great a disadvantage as compared with our competitors abroad, and the incidence of any tariff that would be effective from the dye-maker's point of view would be almost impossible to frame. There remains the third method—that of a temporary control over the imports of dyes into this country and the method of a special kind of subsidy by the Government to meet the probationary period.

There has been much discussion as to what should be considered the probationary period, and the period necessary for this country to develop a dye industry that would make us practically independent. I should think the term of 10 years given by the Board of Trade is a reasonable calculation. The problem is therefore how to bridge over this interval.

Here I am making use of a contribution which I made to the *Times* of January 14 of the present year. My suggestion was that there should be formed a temporary Dyes Control Board, which should bring under review the whole of the requirements in dyes of the manufacturers of this country. This Board would form a sort of exchange through which, to begin with, all the dyes, whether home or imported, would pass, and this Board would fix the prices to be charged to the users. But it would be the constant objective of the Board to reduce its activities stage by stage till at the end of the period of, say, 10 years, it would cease to exist, at least in its capacity of an exchange.

Let us assume such a Board now formed, and that it had ascertained the requirements in the various dyestuffs for the first year. Let us suppose that, after eliminating many items which are only needless varieties of others, the number of colours it had to supply was, say, 1,000 in all. The first duty of the Board would be to ascertain which of those colours can be procured in this country, in what quantities, and at what prices. They would at the same time learn what prices ruled abroad for corresponding colours. This comparison, let us say, revealed the fact that there are being produced in this country at the present day, say, 100 colours equal in quality and price to the corresponding colours produced abroad. As regards this group of 100 colours, the first duty of the Board would be to announce to manufacturers and dye-makers that these colours are to be given a free market, and that the Board will take no control over them whatever.

As to the remaining 900 colours, the review would reveal very varied conditions. Some would show home productions to be only slightly dearer than foreign, though equal in quality; some would show much higher in price, yet inferior in quality, while some would not be procurable at all in this country. All these grades would have to be treated separately and in the manner best suited to bringing every one sooner or later, but as soon as possible, on the free list. Meantime, however, the problem is to be faced of giving the manufacturers these colours at the same prices as they can be purchased by competitors abroad. This is how they would act.

The Board would buy the production of the home dye-makers at such prices as its members had satisfied themselves showed only a reasonable working profit. Suppose the requirements for a certain colour to be 100 tons a year, the home production to be only 50 tons, and the price 6s. per lb. The same colour, it may be found, can be purchased abroad at, say, 4s. per lb. In order that the home manufacturer may be enabled to procure this colour at the same price as his foreign rival, the policy of the Board would involve its

supplying users in this country at 4s. per lb. for the whole 100 tons, otherwise they could not compete. The exchange would, therefore, purchase 50 tons from the home producers at 6s. per lb. and another 50 tons from abroad at 4s. per lb., and hand over the whole 100 tons to users in this country at 4s. per lb.

This method spread over a number of colours would of course show a large loss to the Board for the year, but that is the form in which I suggest the Government should give its main help and contribution towards the combined interests of the dye and textile trades.

Having accepted the situation regarding such a colour as is exemplified above, or such a group of colours, for the first year, investigation would be set on foot as to the causes for the higher price, or it might be the defective quality, of the home product as compared with the foreign article. This would be intimated to the dye-makers, and a certain time allowed them to make good in these particular colours—say, one, two, or more years—according to the nature of the problems involved; and by the expiry of the period stipulated this colour, or group of colours, would be put on the free list and outside the control of the Board.

In this way it might be expected that each year would see a further 100 colours put on the uncontrolled list, and by the end of 10 years the dye-making industry would be expected to be able to stand on its own legs and welcome competition. At any rate, the Board of Trade by this arrangement would have given the industry an opportunity to establish itself.

In the meantime I should like to suggest to the Government in these days of controlling and organising that a good deal might be done to further the progress of dye-making in this country by some judicious co-ordination of production.

Discussion.

Dr. M. O. Forster said that the most ridiculous statements were being made as regards the comparative efficiency of British chemists and German chemists, and some remarks were also being made with regard to German chemists. He read a short time ago a statement by a properly recognised chemist in America to the effect that the American chemists in four years had accomplished what German chemists did in 20 years. That, to his mind, was bunkum of the most dangerous character because it was so misleading. What American chemists did in four years was successfully to repeat in the laboratory and in the factory experiments on a small and a large scale which it took German chemists 20 years to elaborate *de novo*, and that was an absolutely different thing. The four points which had been given as essential to the permanent establishment of the dye industry were, in his judgment, all equal in importance, and Dr. Levinstein had been very careful to say that he did not differentiate between them in quality or quantity. The thing that impressed him most was that Dr. Levinstein had not been carried away, in spite of his own extraordinary personal achievements during the war, by this absurd optimism which had affected so many people. That was a great comfort to him, because it must not be overlooked that Dr. Levinstein was going to be responsible in the future for an enormous national undertaking. In fact, in a certain sense, he shared with the professors of the universities and colleges the responsibility for the future of the coming generation of chemists.

Professor W. H. Perkin said there had been a tendency lately in certain quarters to make the situation appear much more favourably than actually was the case. Whilst they could congratulate themselves on certain things that they had done, they must also look at the other side of the question and see what an enormous amount of work there was to do, and that was one of the reasons why the absolutely clear statement in Dr. Levinstein's paper should be so valuable. He personally was particularly interested in the co-operation of the universities and the industries, and had long looked at the matter from the point of view that what was required in the dye industry was the best chemists that could possibly be got. These men had to be trained in the universities and technical schools, and it was very important that the best scientific ability should be concentrated in the universities. He had been pleading for many years that the industries should make use of the scientific brains which were concentrated in the universities, and that was being done now. For instance, in connection with the dye industry there were at some of the universities, such as Oxford, Leeds, and Liverpool, little colonies of men working at problems connected with the dye industry. That aspect of the matter was in its infancy, but what had been done was sufficiently encouraging to lead to the hope that all manufacturers would see to it that the universities were largely used in this connection.

Mr. F. H. Carr said it was of paramount, fundamental, and essential importance that, as Sir William Pope had said on the previous evening, England should be the home of chemistry. England could not be the home of chemistry unless it was the home of industrial chemistry. The universities ought to be able, as Professor Perkin had pleaded, to maintain a large number of professors and chemists to carry out that research work which was necessary if England was to be the home of chemistry, but that could not be done unless the industry was flourishing and making large profits which would enable it to treat the universities generously. Makers of dyes ought to see to it that the profits which had passed into their hands and which had not passed out again were utilised as capital for immediate development.

Mr. James Morton said one point which had impressed him very much in listening to Dr. Levinstein's paper was that having such an army of chemists in this country for the dye trade would also be a stimulus for general invention. It was not only the dye industry that was going to benefit; it was going to quicken the intellect of the whole country, and it would affect industries quite different from the dye industry.

Dr. Levinstein, replying to the discussion, said he did not propose to criticise the detailed proposals made in Mr. Morton's paper for the Government support of the industry, because the Government policy had been formulated, and we should have to see how that policy worked out in practice before discussing in detail other alternative schemes. With regard to Professor Perkin's remarks, it was perfectly clear that no one man was going to revolutionise the industry, and they must recognise the fact that all the best chemists of the country, who, for the most part, were associated with the chemical schools and universities, supported them and were willing to help them. During the war there had been a great change in the outlook of the universities. They now held themselves far less aloof from industry, and they had accomplished extraordinarily fine work during the war, and he looked forward to having great support from them in the future primarily in supplying the industry with raw material in the shape of well-taught chemists who had learned how to work rapidly and cleanly and to think.

The Chairman said that he had very great admiration for the scheme Mr. Morton had put forward as to how the problems that were going to arise in connection with the dyestuffs should be dealt with. Whilst it was quite conceivable that something of the kind which Mr. Morton had suggested might ultimately be adopted, he wished to call attention to the fact that there were several respects in which it would be rather difficult to adopt the whole of his proposals. We should have to face, of course, the competition that would undoubtedly come from abroad, and he wanted to call attention to the fact that the Germans would undoubtedly come here in the future and make proposals to dye users. They would say to the user that there were certain dyes which were not being made in England, but which the Germans could make, and that they would let the British user have these dyes at a relatively low price if there were included in the contract other dyes and colours that were being made in this country. That was one of the ways in which the Germans would probably try to defeat such a proposal as Mr. Morton had made. Then Mr. Morton had stated that very little had been done during the war to avoid unnecessary duplication of production and unnecessary duplication of research. Whilst he agreed entirely that there had been a great deal of that sort of thing, he was afraid that during war-time it was inevitable, because Mr. Morton would admit himself that there was a great shortage of a number of these products, and that if people who wanted them and could not get them from one firm they went to another, and the result was that different people started to make intermediates in order to supply the absolute need for these dyestuffs. Some people also had actually to start making intermediates, because the quality of those they were able to obtain was not good enough for their requirements, and that again led to duplication. It was perhaps for the Government to deal with a situation of that kind, but he was very doubtful now whether the Government could really do very much in preventing what Mr. Morton had called attention to. When the Association of British Chemical Manufacturers was formed about three years ago, one of the principal objects was to get chemical manufacturers together in one body, so that they might discuss the problems interesting them with a view to preventing that duplication of plant and research. He knew that the Association had not accomplished anything like what it was hoped it would do in the time that it had been working, but he did know that something had been

done in that direction, and he had great confidence that a great deal more would be done in the future. With regard to the work that had to be done by the Board of Trade Licencing Committee, he thought that before long—perhaps it would take some months—ways and means would be found to overcome some of the serious difficulties that Mr. Morton had called attention to. He was quite certain that there would be a great deal of adverse criticism, but he hoped there would be a certain degree of patience exercised, and that it would be possible in that way to avoid a very difficult situation.

The conference then adjourned until the afternoon.

"THE MANUFACTURE OF INTERMEDIATES."

By E. V. EVANS, F.I.C.

Intermediates are not only manufactured by the British Dyes Corporation, but also by a number of other chemical undertakings. They constitute a special group of the Association of British Chemical Manufacturers, and may be said to represent all British makers of coal-tar intermediates and dyes outside the British Dyes Corporation. They have, however, until recently been mainly engaged in the production of munitions, poison gas, and other war necessities, and have thus, except in a few instances, been prevented from taking a really important part in the production of dyes. When considered individually most of these undertakings are small compared with the British Dyes Corporation, but in the aggregate they represent an invested capital of some twenty-five million pounds, and, if their efforts are co-ordinated, form a body admirably suited to deal with the problems of the future.

Whatever means may eventually be adopted to develop the whole of the country's resources consideration might advantageously be given to a few of the underlying principles practised by Germany to protect its chemical industry. It is acknowledged that that great octopus of the German chemical industry, the *Interessen Gemeinschaft* and the *Erweiterte Interessen Gemeinschaft*, possesses many disabilities. This scheme of selective protection for certain chemical manufacturers would have led to the destruction of the industry had it not been judiciously controlled by a directorate prepared to forego immediate financial returns in order to ensure the establishment of a permanent chemical industry. As an example of the latest developments of this scheme, it is found that one large works obtains a certain product from a distant works of an apparent competitor, although it is itself fully equipped to manufacture this same product. This is brought about by the fact that the distant works, owing to its superior geographical position, is able to manufacture the product more efficiently. It is remarkable also to find that a plant at the works of Bayer and Co. is closed down because the market requirement for the product is satisfied by the output of the *Badische Anilin und Soda-Fabrik*, which is able to manufacture more economically. Here and in many other instances may be seen the effect of co-ordination in the German chemical industry, and it should be emphasised that the industry is self-controlled by a highly technical directorate of chemical manufacturers.

In the manufacture of the intermediates still required in this country processes of a certain degree of complexity are entailed. Moreover, of these many are required in small quantity. It is therefore impossible to imagine that the manufacture of these new intermediates when conducted in a number of small units distributed throughout the kingdom will lead to success. In such cases, in order to pay due regard to the importance of mass production, manufacture must be undertaken only by one or two makers possessing special facilities, for it is no simple matter to displace imported manufactures at the present moment, even with installations of large output, owing to the existing cost of plant and apparatus and the high prices of labour and fuel. Whilst on the one hand great attention must be paid to mass production, it is in the natural order of things that the manufacture of intermediates should not be concentrated in one or two centres, but should be distributed in order to take full advantage of the present resources of the chemical industry. This distribution should be decided by such factors as geographical position, the cost of fuel, of transport, and of labour, and the present fitness of the manufacturer to undertake the work in question, but when the decision is made, plant of considerable output should be installed.

Professor A. G. Green said that if the author advocated a complete separation, or anything like a complete separation, of intermediates manufacture from dyestuffs manufacture, he

could not agree with him. Such an argument left out of account many factors, such as the factor of the close inter-relationship of by-products. For instance, in the manufacture of beta-naphthol, sulphite might be required for another manufacture. People making only beta-naphthol might not be able to do anything with the sulphite, and would have to sell it, but in the big works where a large number of products were being made it was possible to use the by-products of one manufacture as the principal products of another manufacture, and he therefore did not think they could divorce dyestuff manufacture from the manufacture of intermediates.

Mr. F. H. Carr said that anyone coming home from that wonderful centre of distribution, the Rhine, could not help seeing the enormous advantages to their chemical industries that the Rhine had, because it brought each unit of the concern into immediate proximity with the other, even although they might be 20 or 30 miles apart; there were wharves running right up against a deep navigation, and they could lift the goods from the river straight into any part of the factory required. In England it was desirable, if we possibly could, that we should develop the idea of consolidation of industries in the same way, making use of the best equivalent we had—viz., the Mersey or the Manchester Ship Canal.

Mr. Arthur Green did not think, from what he knew of Mr. Evans's position with regard to this matter, that he would claim that in all cases intermediate manufacture should be separate from dye manufacture. At the same time he could not go quite so far as Mr. Evans seemed to indicate—viz., that the secret of the success of the chemical works in Germany was their geographical position; it was more due to the fact that they manufactured everything for themselves. The raw material was taken into these great factories on one side—say, for the manufacture of a heavy chemical. That was passed to the next section, where it was used in the manufacture of intermediates, and from there it was merely passed across the road to the section which dealt with the conversion of these intermediates into dyestuffs, and finally it passed into the section where the dyestuffs were packed and despatched to the consumer.

Dr. J. C. Cain thought Mr. Evans was not disposed to make all intermediates in an intermediates works. He would make certain intermediates in the dye-manufacturing works and certain others in separate works. It had rather been conveyed that the German dyeworks made all their own intermediate products, whereas it was a fact that one works alone concentrated on salicylic acid. Von Heyden's before the war was the only firm making salicylic acid, and there were other similar cases to that. On the other hand, there were intermediates, such as metaphenylenediamine, which could be made in the dyeworks to better advantage than in an intermediate works.

Professor H. E. Armstrong said the development of the chemical industry in Germany commercialised and ruined the majority of the German laboratories by making it clear to them that it was desirable to make money out of chemistry. It spoiled them as educational centres, and his view was that, although Germany had gone up in the technical commercial scale during these years, she had been steadily retrograding in the scientific scale, and what he was most anxious to see avoided in this country was any socialisation of our scientific industry through Government grants. The Government had instituted a system which was bound to commercialise our science, if we were not careful, by putting a money bait before academic students. In his day in Leipzig no two of them—and there were 20 or 30 of them at work—were engaged on a similar theme. Each one of them knew what the other was doing, there was free intercourse among them, and the training they were getting was the training that the whole lot were getting. They communicated one to the other what they learned, and taught one another. A few years afterwards the staff was subsidised by the manufacturers, and instead of the students being free to talk about their work, they were put under a pledge of secrecy not so say a word about it, and that had a most serious influence. He did not want to see that condition introduced here. He happened to know practically all the men who had led in the German chemical industry during the last 30 years. They were an extraordinarily strong crew, prepared to row together, and who had been rowing together for years. We never had a crew which rowed together in this country of any size in these matters, and until we learned that first lesson of rowing together we would make no progress. We had not got the men for a crew. We had a certain number of chemists who could do things in the laboratory when they were told, but we had not got men of any imagination, of any commercial

grasp, men with any *savoir faire*. A great deal had been said about the advance of the industry, but what would be the opinion if they went among the different dyestuff users? He would have liked to have them at the meeting to know if they were satisfied not merely with the range but with the quality of the goods they were getting. He was not sure that they were. It was points of that kind that we had to pay attention to, and it was no good our bothering ourselves about Germany. We had got much more serious competition coming from America, where the chemical industry was far ahead of us from the point of view of organisation.

Mr. Evans, in reply to the discussion, said his instructions from those who sent him to Germany were to write a paper in which matters could be read between the lines, and nothing more was given. It appeared that he had been successful in doing that. His paper was really a plea for leadership.

The Chairman said he would like to know how far the ideals which Professor Armstrong had expressed with regard to universities undertaking work for business or industrial undertakings agreed with the views of Professor Perkin as expressed during the morning. It seemed to him that there was a certain disagreement between the two because he rather gathered from Professor Perkin that he thought it was desirable for us to follow the example set by Germany in making use of the exceptionally brilliant men at the universities and getting them to work in conjunction with the large industrial undertakings.

Professor Perkin said that no chemical laboratory nowadays could exist or flourish unless it was in connection with the industry. Chemical laboratories were enormously expensive in regard to the appliances and buildings which were required, as well as the staff that had to be paid more highly than it used to be, and unless it was in contact with the industry and got much of its material and apparatus free, and unless it got a Government grant, which Professor Armstrong did not seem to agree with, the laboratory simply could not exist. It was perfectly well known—it had been calculated out in Manchester—that the University lost about £70 a year on every advanced student. Where was the money coming from without grants or private benefactions. Another thing was that they must hold out to the man who was studying chemistry some hope that he would get some kind of remuneration later on—i.e., money must enter into the calculations of every student; there must essentially be a certain amount of commercialism about every university. With regard to contact between the university and the works, the type of research that was required by a works was practically the same as the kind of research that was carried out in the university laboratory. There were many problems which presented themselves to the chemical manufacturer which could perfectly well be solved, and best solved, in the University chemical laboratory.

The Chairman then called on Professor Green to read a paper on

"PATENT LAWS IN THE CHEMICAL INDUSTRY."

Professor Green said he wanted to raise a point in connection with our patent law policy. As they all knew, a new patent law was being considered by the Government. Everybody who had worked on war work knew the enormous assistance which the industry had received from German patents. The Germans, of course, were especially aware of the fact that they had by means of their own patents assisted us tremendously in our war work. He was credibly informed that they intended to change it, and, indeed, we might feel that to a certain extent they were bound to change the policy which they had had up to the present in regard to patenting. In future, in his opinion, they would take no patents with the exception of such processes in which the process was indicated by an examination of the end product. They would not take any patents for intermediates where it could not be told from an examination of the end product how the thing was done, and they would not take any patents for improved processes. That must influence our policy because if we continued to patent things in the same way as we had before we should be in the position that the Germans would know what we were doing, but we should not know what they were doing. Moreover, we should have no possible means of bringing home infringement. A product might be sold on the English market which was made by a process patented here, but it would be impossible to tell necessarily by examination as to what method was adopted. There then came the difficult question that if we did not protect our inventions how could we establish prior use. It would seem that one of two

courses were open—either some amendment of the patent law, by which possibly a process for an intermediate, where it could not be told from the final product what it was, or for an improved process, might at the discretion of the Board of Trade be kept secret for a certain number of years. The other thing was to keep the process secret, and that, of course, was a very great disadvantage in many ways. To keep a process secret indefinitely tended to prevent further progress, and, also, how were they to establish prior use?

The question of prior use was one which lawyers did not seem able to come to a decision upon. What was prior use, and how could it be established? If a process was worked out in the laboratory and a few hundred grammes were made of it, but it was not manufactured, and somebody else came along and took a patent for that process independently, could they bring forward their laboratory books to show that they had made the substance? Could they establish prior use and upset the other man's patent? He was informed by patent solicitors that we had not got in this country a similar law to what they had in Germany. In Germany, if a patent was taken out and another man came along and said he had worked the same thing before, and if he proved it conclusively, the patentee could take no action against him. He could not upset him in any way, but the patent remained good to the rest of the world. In this country he was informed that a patent was either valid or it was invalid. If it was invalid against one person it was invalid against the world. If one single man came forward and showed that he had used that invention before, and that he had put it into use before, the subsequent patent was invalidated. The point he wanted to make was how could they establish prior use if a process was kept secret? As things stood at present, the inventor was thrown back more or less on this position—that if he kept the process secret he was very doubtful whether he was safe. An independent inventor who also patented it might possibly prevent him working his own invention. On the other hand, if he patented it he might simply be giving away his invention to the world. That was a highly unsatisfactory state of things, and something required to be done.

The Chairman said it had been a very great advantage to have had Professor Green touch shortly on this very important subject, because it raised some difficult questions which should be talked over in wide circles and discussed at a later moment so that some proposals could be drafted before the new Patents Bill was again considered.

The following paper was then read:—

"THE MANUFACTURE OF SYNTHETIC DRUGS."

By F. H. CARR.

In its commercial aspects, the manufacture of pharmaceutical chemicals is an important branch of chemical industry, for it utilises the same intermediates as are employed in the dye trade, whilst it also constitutes an outlet for by-products which are not of use in the colour industry. The Association of British Chemical Manufacturers has successfully argued that it is a key industry which should be protected, at least temporarily; and the Board of Trade, by a recent Order in Council, has restricted the importation of foreign-made fine chemicals to those for which a licence is given by a specially appointed committee. The action of the Board of Trade affords a period of time to enable us to set in order a house which was turned topsy-turvy by war, and I wish particularly to direct discussion to those steps which can now be taken for this purpose.

It is in regard to synthetic drugs not protected by patents, for which a big demand has been created, that conditions abroad are at present so much more favourable than at home. In making these chemicals, the cost of primary materials—such, for instance, as caustic soda, chlorine, zinc, acetic acid, and alcohol—is of much significance; and the intermediate products and by-products being intimately connected with the requirements of the dye trade, Germany secures a great advantage by combining their manufacture with that of dyes. The strength of this combination is particularly significant in the manufacture of these pharmaceutical chemicals, because the quantity of them needed for the whole world's requirements is limited, and over-production is readily reached.

By the complete internal organisation of their chemical trade, the German chemical manufacturers are enabled to allocate particular manufactures to that works in which they can most suitably and efficiently be produced. The immense strength of these firms lies in their complete internal organisation in one body known as the *Interessen Gemeinschaft*. What resources and potentialities have we to set against the proved

ability and power of this great German organisation with reasonable prospect of success?

Organisation among the firms engaged in other branches of chemical industry has made great progress, but in regard to synthetic chemicals much remains to be done. It is imperatively necessary, by making agreements or by other means, to prevent useless overlapping, to capitalise each manufacture so that its engineering equipment is of the best, to establish an intimate financial connection between the making of the primary, intermediate, and finished products involved, and, lastly, to achieve, where needed, technical co-operation. Let us consider two proposals: (1) That a large group of the present makers should close down their plants and combine in a united effort; (2) that one or more of the large makers of dye intermediates should manufacture these synthetics and supply them in both crude and purified state, as desired, solely to a group of the present manufacturers, who could, if they chose, purify the crude products, and thereby continue to supply branded material of the quality and specification for which they have established a reputation.

The former plan would possess many of the advantages of co-operative effort, but would be subject to the disadvantage that if such an amalgamation produced its own intermediates the scale would still be small compared with that on which the dye producer makes the same substances, and should it not do so it would not purchase them as cheaply as the intermediate maker would produce them; but this plan has a greater difficulty in that the various firms combining would need to sell goods of identical price and quality, which, it is feared, would be unsuited to businesses which are concerned with branded articles of special quality. The second proposal would possess the advantages of large-scale production and technical co-operation, yet would allow the firms so desiring to purify their own finished products, and thus to maintain their separately acquired reputation.

In the manufacture of many pharmaceutical chemicals there remains room for individual achievement, and any satisfactory organisation of the industry must secure the fullest and freest scope for such effort. If the more important fine chemical manufacturing firms were to combine in the manner indicated to make the substances to which I have referred they would make larger profits out of them, and so have more money to utilise in individual developments and research.

Captain L. M. Nash, of the Department of Industries and Manufactures, Board of Trade, said he had come as the representative of the Board of Trade, and would like to say a few words about the prohibition of imports. When the war broke out there were a number of chemicals the supply of which we had previously relied upon Germany for, but which it became necessary to make in this country. Those chemicals had to be made under very great difficulties with any old plant that could be scraped together, and in any old building that could be got hold of, and more or less regardless of cost. We had now come to the point that the war was over; but if these same chemicals were allowed to be imported straight away, these new industries which had been built up so very capably by the manufacturers must have died a sudden death. Those who had seen those large works in Germany must be convinced that we could not turn out these things in backyards and in 2cwt. boxes. They must be made on a large scale in order to secure economy of production, and therefore he earnestly hoped that something would be done on the lines suggested by Mr. Carr. The next point was quality. He had no doubt that many of these new chemicals were already satisfactory as regards quality, but he believed that in other cases the standard of purity was not yet that which had been reached before the war with imported chemicals. He hoped the industry would give full attention not only to maintaining the pre-war standard, but to improving it, so that when the time came when these new industries were no longer Government protected and supported, they would be able to maintain their position in the world. The prohibition was put on simply and solely to enable the British manufacturers to put their houses in order so that these new industries should not die a sudden death. If the prohibition was taken as a means of enabling the manufacturers to increase their profits, then they would have entirely failed to grasp the value of the prohibition, and it was only to be expected that the manner in which this prohibition was used must be taken into account by the Government when they formulated their future trade policy.

Dr. Levinstein said it was a sign of the times very much to be welcomed that a representative of the Board of Trade should stand up, and, speaking to them as a member of the Society, assure them that the Board of Trade took an interest in everything they did and offered to give a sympathetic

hearing to anything that might be put before it. He did not know that there was any change in our national life during the past five years which was comparable with the change of attitude which was now being experienced from that Department. He was rather inclined to deprecate the general statements of Professor Armstrong and others in which they were told to organise—as if any person did not know that organisation was one of the prime needs of commerce at any time. There was a great difference between telling people to organise and thinking out and creating a satisfactory organisation. He would like to say to some people that organisation did not consist in combining together in one rotten concern all the firms who had pretended, successfully or unsuccessfully, to have made money out of fine chemicals and dyes during the war. If that point was fully appreciated by the gentlemen who talked to the industry about organisation it might be possible to come more quickly to that kind of decision which they all desired. He agreed with Mr. Carr that amalgamation or working arrangements must come from the industry, and not from trade associations; and he would like to point out for the benefit of Mr. Evans with regard to the I.G.—the composition and constitution of which he so entirely misunderstood—that the great power of the I.G. and its danger to this country as a competitor lay in the fact that all the members of the I.G. pooled their profits, and that any real organisation in our present industrial system meant that various people who organised had a common financial interest in their respective undertakings.

Mr. D. Lloyd Howard said he would like to emphasise what Mr. Carr had said with regard to the fine chemical and the great synthetic firms not endeavouring to work for the survival of the fittest, but working in co-operation.

A hearty vote of thanks was accorded to Mr. Carr on the motion of the Chairman.

THE ANNUAL DINNER.

There was a large attendance at the annual dinner at the Savoy Hotel on Wednesday (July 16), the president, Professor Henry Louis, being in the chair.

The loyal toasts having been duly honoured, the Rt. Hon. Sir Alfred Mond, Bart., proposed "The Society of Chemical Industry." There never was a time perhaps when the Society of Chemical Industry had more reason to be glad and proud of its existence and of the work it had done for so many years. It was curious that it required four and a half years of dreadful war to convince this country and its Government of the importance of the chemical industry to the world, and especially to the country in which we lived. Yet what the chemical industry had done during the war was a very small thing compared with what it had done for many years during peace.

Professor Henry Louis said it was an easy task on this occasion to return thanks on behalf of the Society for the toast which Sir Alfred Mond had given. They might pride themselves on taking high rank among the technical societies of the country. The chemical industry, as Sir Alfred Mond had truly said, had proved itself over and over again in these strenuous days or war, and in any task that might be put on it in the future it would not fail. The problems of the chemical industry were the problems of industry in general; the problems that faced them on every side were the problems of under-production. He was not afraid of high wages. The wages paid even to-day were little, if any, higher than they were in the United States before the war, yet nobody would suggest that the United States was then in a moribund condition. There was, however, a difference. The American workman got high wages, but he earned them. (Applause.) There was no minimum wage there. If they paid a man for a day's work, he did a day's work. We were passing through troublous time, but we had passed through troublous times before, and he felt every confidence that the sound common sense of the great mass of the people would before long rise to the occasion. (Applause.)

Sir William J. Pope, K.B.E., F.R.S., proposed "The Health of the Delegates of the Inter-Allied Conference of Pure and Applied Chemistry." He had to associate this toast with the names of several of their distinguished guests. France had sent a number of its first chemists. (Applause.) Professor Moureu was with them that evening not in the simple capacity of a representative of the Inter-Allied Council, but as the president of that Council. They had also a representative of Belgian chemistry, Dr. R. Lucien, one of the former presidents of the Belgian Chemical Society. They had a number of American guests with them, and he had to associate the toast more particularly with the name of Dr. F. G. Cottrell, known

by so many great technical achievements, and who had latterly done such great service in connection with the manufacture of helium on a large scale. They had hoped to have as representative of Italian chemistry Professor E. Paterno. He had been unfortunately prevented from getting there, but Dr. Severini had honoured them with his presence.

Professor Moureu, speaking in French, said that the Inter-Allied Confederation of Associations of Pure and Applied Chemistry had eagerly responded to the invitation of the Society of Chemical Industry. Born at Paris only a few months ago, having as yet made only a few timid steps, it had sought the first occasion to take cognisance of itself, to affirm its vitality, to state its programme, and to develop its means of action. Such an occasion the Society of Chemical Industry had given with the decisiveness and energy characteristic of the British temperament. The success of the Allies had been complete, and it was right to say not only because it was the truth, but also for the sake of the future of the science and in the public interest, that chemists had played a large part in achieving that success. (Applause.)

Dr. Lucien, also speaking in French, said that an illustrious teacher under whom he had studied for many years taught that the happiness of mankind was bound up with the facility for producing quickly and cheaply. Certainly a banquet was not the place where one could best philosophise on such a theory, but his hosts might believe that the need which had brought their guests to London was essentially a productive one. In the course of his career he had noticed two kinds of difficulties—those which came from Nature, which were always surmountable, and those which came from men. These, the regard for oneself, the competition of interests, etc., offered more difficulty; but he was happy to state that here he had encountered nothing but goodwill.

Signor Severini said that it had been with pleasure that he had taken part in the Inter-Allied Conference of Pure and Applied Chemistry. Having brought their labours to the present point, he dared to think the end would be attained.

Dr. F. G. Cottrell said that a hundred years ago the United States had been facing problems similar to those the new nations were facing to-day. The new nations were now looking to the older ones for guidance, and they should be helped, not only by industrial and business contact, but by sympathetic human confidence.

The last toast was "The Health of the Guests." This was proposed by Mr. John Gray, president-elect of the Society of Chemical Industry. There were at the dinner that night, he said, many guests of eminence in the chemical profession and the chemical industries, and the Society welcomed them because of the interest which they had showed in its work. The country was indeed fortunate in possessing such men as the Rt. Hon. Lord Moulton—though he had to regret Lord Moulton was unable to be present with them that night. But they had present Sir James Dobbie, whose services to the country as Chief Government Chemist were well known, though they were carried out in a quiet and unostentatious manner. Sir James had recently relinquished the position as president of the Institute of Chemistry, and now occupied a high position as president of the Chemical Society. They all knew the very great work that he had done in connection with the raising of the status of the chemist. He (the speaker) hoped that the days of the inadequately paid chemist were passed and gone.

Sir James Dobbie, D.Sc., F.R.S., thanked Mr. Gray for the very kind terms in which that gentleman had referred to his services as Government Chemist and to his presidency of the sister society—the Chemical Society. There had never been any time in which it was more important that the most cordial relations should exist between the Society of Chemical Industry and the Chemical Society.

Mr. W. B. M. Bird, Master of the Worshipful Company of Salters, also responded. Some of those present, he said, might not know why the Salters' Company were prominent on such an occasion as this; but some years ago, in the early days of the war, when they began to see what chemistry was doing, they had considered whether a great City company could not employ its funds in a manner more in consonance with the ideas of its original charter than were the distribution of miscellaneous charity and the giving of great banquets. A committee had been appointed, and, after considerable investigation, had come to the conclusion that chemical industry was the one which was originally intended to be promoted, amongst other interests, by the Salters' Company. On the advice of the committee, the company had resolved to see how far it could further the interests of industrial chemistry by applying its funds in that direction. (Applause.) Many

eminent chemists had been consulted, and eventually there had been formed the Salters' Institute of Industrial Chemistry. The object in view was to get hold of young men who had taken their science degree, and whose circumstances would not permit them to continue the course which they had begun, and for which they had a leaning. At the present moment there were 18 beneficiaries, to each of whom was granted a sum of about £250. per annum towards the cost of continuing his education, in the hope that another three years or so of that training would make him a really useful member of the chemical world. (Applause.)

The conclusion of the report of the proceedings of the annual meeting of the Society of Chemical Industry will appear in our next issue.—*Ed. C.T.J. and C.E.*

PARLIAMENTARY NEWS.

Report on British Cellulose Company.

In the House of Commons Sir D. Maclean asked the Prime Minister when the report of the Committee appointed last August to inquire into the cellulose question will be presented to the House?

Mr. Bonar Law: As I stated in reply to a similar question on July 1, it is hoped that the report will be ready this month.

Sir D. Maclean: Will the right hon. gentleman take such steps as will expedite the issue of the report so that we shall have one of the ordinary Parliamentary opportunities of debating it before we rise for the holiday?

Mr. Bonar Law: Yes. I shall try and have it circulated as soon as possible; but as my right hon. friend knows, Lord Sumner is at present in Paris.

Beet Sugar Factory.

Sir J. D. Rees asked the President of the Board of Trade whether any—and, if so, what—assistance is being given by the Government to the establishment of a beet sugar factory at Kellam?

The Parliamentary Secretary to the Board of Agriculture (Sir Arthur Boscawen): The Government have decided in principle to give assistance to the British Sugar Beet Growers' Society for the purpose mentioned by means of an advance of part of the capital required, and a guarantee of interest for a certain number of years on the remainder of the capital up to a fixed amount. The exact terms and conditions of the assistance to be given are now under consideration.

Trading With Germany.

Major Breese asked the President of the Board of Trade whether—notwithstanding the issue of general licences under the trading with the enemy legislation, authorising, with certain reservations, the resumption of trade with Germany and German-Austria—he has reason to believe that British firms are reluctant to renew commercial intercourse with the late enemies of this country; and whether, seeing that it is desirable in the interest of British trade and of the financial credit of this country that British firms who are in a position to do so should exert themselves to the utmost to sell goods to these countries, his Department will issue a general statement on this subject for the guidance of British firms.

Mr. Bridgeman: I think it quite possible that many British firms may feel reluctant to resume relations with our late enemies, but I am not yet able to make any announcement on the subject.

Oil Supply.

Mr. Jesson asked the President of the Board of Trade whether, having regard to the increasing demand for oil fuel for industrial purposes both in this and other countries, he will, in conjunction with the Governments of our Dominions and Colonies and the Secretary of State for the Colonies, consider the advisability of organising and co-ordinating all the sources of oil supply within the British Empire with a view to preventing such supplies coming under the control of cosmopolitan financiers and others seeking to establish a world-monopoly in oil?

Mr. Kellaway: I have been asked by the First Lord of the Admiralty, the Minister in charge of petroleum affairs, to state that this matter is receiving consideration, and was one of the subjects discussed at the last Imperial Conference.

SCOTTISH OIL COMBINE.

INFORMATION is now available concerning the proposed consolidation of the interests of Scottish oil companies by the formation of a new company in which the Anglo-Persian Company will have a substantial interest. The Anglo-Persian Company offer to purchase the whole of the issued ordinary shares of the Scottish companies on the following terms:

Pumpherstons Company.—285,500 ordinary shares of £1., fully paid, at £5. per share.

Oakbank Company.—200,000 ordinary shares of £1. each, 17s. paid, at 37s. 6d. per share.

Broxburn Company.—235,000 ordinary shares of £1. each, fully paid, at £2. per share.

Young's Paraffin Light and Mineral Oil Company.—113,202 ordinary shares of £4. each, fully paid, at 63s. per share.

James Ross and Co., Philpstoun Oil Works.—135,000 ordinary shares of £1. each, fully paid, at 25s. per share.

The capital of the new Scottish company to be formed will be £4,000,000., and will consist of 3,000,000 7 per cent. non-cumulative participating preference shares of £1. each, £3,000,000.; and 1,000,000 ordinary shares of £1. each, £1,000,000. The new company will also acquire the properties and goodwill in Scotland of the British Petroleum Company and the Homelight Oil Company for the sum of £150,000., payable in cash. The ordinary shares will be subscribed for by the Anglo-Persian Company. Participating preference shares of £1. each, fully paid and ranking for dividend as from May 1, 1919, will be issued to the shareholders of the various companies.

When the new company is formed, the Anglo-Persian Company will, it is stated, as from January 1, 1923, supply such quantities of crude oil to the new company as may be necessary, with the supply of crude oil from shale, to enable the present refineries of the existing companies to be kept running to their full capacity at a price to the new company based on a sliding scale which, it is estimated, will enable the new company to pay the 7 per cent. dividend on the participating preference shares and the ordinary shares, and leave a surplus for division between the participating preference and ordinary shares.

IMPORTATION OF CHEMICALS.

ON June 25 a Proclamation was issued under Section 43 of the Customs Consolidation Act, 1876, prohibiting the importation, among other goods, of chemicals of all descriptions, except those which were imported under licence given by or on behalf of the Board of Trade, and subject to the provisions and conditions of such licence. The Proclamation appeared in our issue of July 5. At the same time the Board of Trade gave notice that whereas the Proclamation prohibited the importation of all chemicals, the terms of the prohibition had been thus widely drawn solely for convenience of administration, and that it was not the intention at present to do more than to control the entry into the United Kingdom of certain classes of chemicals of a high degree of purity. The Department of Import Restrictions, it was announced, would issue general licences for a large number of chemicals which were not of this description, and they would also issue licences in suitable cases and for limited quantities of the chemicals which were retained under control.

The first list of chemical products for which general import licences have been issued has, in accordance with the above announcement, just been published by the Department of Import Restrictions, and is as follows:—

Acetate of iron; acetate of lime; acetone; alum; aluminium acetate; aluminium sulphate; ammonia hydrate; ammonium carbonate; ammonia chloride; ammonia chlorate; ammonia nitrate; ammonia phosphate; ammonia sulphate; baryta; bleaching powder; boracite; borate of lime; borate of manganese; borax; boric acid; brimstone; calcium carbide; carbon bisulphide; carbonic acid; chloroform; chromic acid; cinchonic salts; cinchonidine salts; citrate of lime; citric acid; copper sulphate; cream of tartar; epsom salts; ether; ferrous sulphate; formaldehyde; fusel oil; gelatine, photographic; glycerine; hydrochloric acid; hydrofluoric acid; iodine; lactic acid; lead acetate; lead nitrate; lithia carbonate; magnesia; magnesium chloride; magnesium sulphate; manganese dioxide; menthol crystals; mercurial salts; methyl ethyl ketone; nitric acid; oxalic acid; phosphoric acid; picric acid; quinidine salts; quinine salts, other than sulphate; quinidine; sal acetos; soda ash; soda, aluminat; soda, bicar-

bonate; soda, caustic; soda, chloride; soda, crystals; soda, nitrate; soda, nitrite; soda, silicate; soda, sulphate; soda, sulphide; sulphuric acid; tartar emetic; tartaric acid.

CHEMICAL TRADE OF HONG KONG.

H.M. COMMERCIAL SECRETARY at Hong Kong states that the total imports of chemicals and drugs in 1918 were valued at £47,663, the principal items being calcium carbide (£53,735.), caustic soda (£44,297.), and sulphuric acid (£30,969.). Almost half the above total is assigned to Japan. The trade in industrial chemicals, more especially in such articles as soda ash, caustic soda and chlorate of potash, has been very seriously affected by the restrictions in Great Britain, but will doubtless recover its position without difficulty once those restrictions are removed.

The most surprising feature of the imports of dyeing and tanning materials, which were valued at £350,104., is the extremely small import of aniline dyes, amounting to only £6,811., mostly from the United States. It is quite evident that dyes of American, Swiss, or British manufacture are as yet far from taking the place in this market formerly occupied by the German products, and presumably the Chinese are for the time being relying on dyes of vegetable origin. Apart from the difficulties that have hitherto existed in procuring adequate supplies from Great Britain or elsewhere, merchants state that the Chinese are not yet disposed to regard the new dyes from America and other countries with much favour, partly owing to the unfamiliar appearance of the packages, and partly to real or supposed defects in quality. There can be no question, however, of the great demand existing in China for good aniline dyes, more especially for a really fast indigo blue, and it is greatly to be hoped that British manufacturers will do their utmost to meet it.

As regards exports of vegetable oils, the largest trade, and one that promises to reach very important dimensions, was that in wood oil, the exports of which amounted in value to £421,582. Of this total the share taken by the United States was £260,779., whilst exports to the United Kingdom amounted to £54,909. One difficulty encountered in connection with this trade is with regard to the method of packing, there being an excessive leakage in the case of the casks usually employed, whilst steel drums would appear to be too expensive. If some more satisfactory method of shipment could be devised it would certainly tend to the development of the trade.

The total imports of paints were valued at £200,350., those from the United Kingdom amounting in value to £60,062., those from the United States to £36,901., and those from Japan to £27,393. In connection with the paint trade a suggestion has been made by a merchant that British manufacturers would do well to devote more attention to the shipment of paints in liquid form, ready for use, in preference to those requiring preparation by the purchaser. Whilst paints in the form of paste are doubtless easier to ship and cheaper, Chinese merchants frequently prefer to buy paints ready for immediate use, and a good deal of business in this line has in consequence been given to American firms.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

The West Cumberland industries have so far been unaffected by labour troubles which have caused the damping down of furnaces in other districts, though it was only at the last moment last week that the iron-ore miners suspended their notices, and so obviated a stoppage which would have compelled an immediate closing of the twenty-seven furnaces in operation between Workington and Carnforth. It has been a hard struggle this week to keep the 380 ovens going on account of the decline in coal production, but it has been managed somehow or other. Had they been working at full capacity it would have been an impossible task. The make of by-products is somewhat reduced, and in the main it is being well absorbed. Benzole is creeping more and more into favour among local users, and the Irish demand for the spirit is also growing. Sulphate of ammonia, though none of it is being exported, is readily marketed. Pitch and tar are not in quite so brisk request as was the case a few weeks ago, and acid products at the chemical works on the coast are weaker.

ITEMS OF INTEREST.

ORGANIC CHEMISTRY AT GLASGOW UNIVERSITY.—The Glasgow University Court on Tuesday appointed Mr. T. S. Patterson, Lecturer in Organic Chemistry at Glasgow University, to the Gardiner Chair of Organic Chemistry.

MANCHESTER UNIVERSITY APPOINTMENTS.—The Council of the Manchester University has appointed Mr. D. H. Bangham, B.A., Lecturer in Chemistry. Mr. J. K. Wood, D.Sc., Lecturer in Chemistry at University College, Dundee, has been appointed Lecturer in Physical Chemistry in the Faculty of Technology.

COMMISSIONER OF DYES.—Sir Evan Jones, Bart., M.P., has found it necessary to resign his position as Commissioner of Dyes, in consequence of the heavy duties attaching to the post of Controller of the Coal Mines Department. In future, therefore, all communications referring to dyes should be addressed to the Assistant Secretary, Industries and Manufactures Department, Board of Trade, Gwydyr House, Whitehall, London, S.W. 1.

TRANSHIPMENT IN THE UNITED KINGDOM.—The Board of Trade (Export Licence Department) announce that it is not now necessary to make application to the Collector of Customs at the transhipment ports on Form S.90 for the transhipment of any goods except those specified in the following list: Seeds, oils and fats on Section "A" of the list of prohibited exports; synthetic dyestuffs; ergot; quinine sulphate; caustic potash; potassium carbonate.

THE FRENCH CUSTOMS DUTIES.—The French Government have suppressed the *ad valorem* duties on imports, and henceforth customs duties will be levied on a new system, under which the amounts payable under specific duties will be multiplied by an enhancement coefficient representing the relation borne by the official value of goods in 1918 to their value in 1913. These coefficient rates will be revised periodically by an Inter-Ministerial Commission to keep them in harmony with the prices of goods as the latter change.

BUSINESS NOTICE.—Messrs. Mann and Cook, of 7, St. Michael's Alley, Cornhill, London, E.C. 3, have decided to transform their chemical department into a branch office, which will be established at 46, Brown Street, Manchester. Telephone: 2348 Central. Telegrams: "Masculine." Manchester. From August 5 next all business relating to chemicals, pharmaceuticals, dyes, varnishes, paints, soaps, candles, and disinfectants will be carried on for home, export, and import from their Manchester address, to which all communications should be sent.

IMPORTATION OF CHEMICALS.—The Board of Trade, Department of Import Restrictions, has agreed to the British Chemical Trade Association being represented on the Advisory Committee, which is assisting the Department in connection with the issue of licences to import chemicals. Mr. William Mann, the President, has been elected by the General Committee to represent the Association. Members are invited to advise the Association of the chemicals which they are likely to wish to import. Members who at any time feel that they have cause for legitimate complaint in connection with licensing restrictions should at once bring the matter to the notice of the Association.

NEW ISSUES.—The subscription list for the new issue of shares in the British Dyestuffs Corporation, Ltd., opened on Monday, and will close on or before July 30. The capital is £10,000,000., divided into 4,500,000 7 per cent. preference shares of £1. each, 4,500,000 preferred ordinary shares of £1. each, and 1,000,000 £1. deferred ordinary shares. The present issue is at par of 2,500,000 preference shares, and 2,500,000 preferred ordinary shares. The scheme of development which is in course of being carried out by the amalgamating companies is intended to provide for the production of complete ranges of dyestuffs and colours required for all industries. Of the proceeds of the present issue, approximately £1,700,000. will be paid to the amalgamating companies to enable them to discharge outstanding liabilities incurred for development purposes, which liabilities were either taken into account in fixing the price paid for the shares of the amalgamating companies or incurred by them subsequent to October 31, 1918. The balance of the proceeds will be utilised for further development of works and plants and for working capital.—The Eastern Chemical Company, Ltd., are offering to shareholders in proportion to their present holdings the balance of the unissued capital—viz., 26,305 participating ordinary shares of £1. each, at 10s. premium. The total capital of the company is £100,000. The list will open on August 11 and close on August 18.

FATALITY AT WOOLWICH ARSENAL.—Some cordite accidentally ignited in one of the huts at Woolwich Arsenal on Wednesday, and a munition girl, Florence Lucas, of Erith, lost her life. Another girl who was at first reported killed was seriously injured. Several others were less seriously hurt.

DYESTUFFS FROM GERMANY.—The Washington correspondent of the *Central News Agency* says: It is learned that officials of the United States Government are favourably considering a proposal to summon a conference of representatives of Great Britain, France, Italy, the United States, Switzerland, and other countries, for the purposes of determining the kind, quantity, and prices of dyes to be taken from Germany under the terms of the Peace Treaty. It is proposed that each delegation shall be composed of one representative of the dye-making industry, one representing dye consumers, and one an impartial business man.

NORFOLK SHALE-OIL DEVELOPMENTS.—We are informed that strong gas pressure, as well as traces of liquid oil, have been found by the drillers on the Norfolk shale-oil fields in making further tests of the properties of English Oilfields, Limited. A new estimate has been made by Dr. Forbes Leslie as to the quantities of petroleum which will be contained in the shales, and the figure is now placed at 200,000,000 tons, obtained from the now proven 1,000,000,000 tons of shale which exist within 300ft. of the surface. Dr. Leslie has presented a report to the directors of the company regarding the sulphur content question referred to in Parliament recently. Dr. Leslie asserts that, apart from the first shale seam, which certainly does contain high percentages of sulphur, all the remaining ten seams are sulphur free.

CHEMISTRY AND THE WAR.—The Birmingham Technical Education Sub-Committee present this week a report to the Education Committee, in which detailed reference is made to the part played by the Chemical Department of the school in regard to research work for the Government. Two of the teaching staff—Dr. T. S. Price (formerly chairman of the Birmingham and Midland Section of the Society of Chemical Industry), the head of the department, and Mr. S. A. Brazier—were given commissions in the R.N.V.R. in connection with special services for the Navy, the former to the rank of Lieutenant-Commander, and he has recently received the O.B.E. (Military Division). In the manufacture for the Government of special drugs—diethylamine and acetal—Dr. Price and Mr. Brazier were assisted by another member of the staff, Mr. A. S. Wood. This work was done under the direction of the Royal Society Committee, and its value has been officially acknowledged. Later Dr. Price and Mr. Brazier took up pioneer work at the Royal Naval Experimental Station, Stratford, which was started by the Government as a result of the German use of poison gas. In April, 1917, Dr. Price was put in charge of all the chemical and technical work undertaken at the experimental station. The work consisted of the manufacture of certain poisonous gases for military use, and also of other gases used for smoke screens and smoke boxes in the Navy. Dr. Price continues to serve as a member of the Chemical Warfare Committee as a representative of the Admiralty.

LEAD POISONING AND WOMEN.—The susceptibility of women to certain forms of lead poisoning and the dangerous effects upon their children are dealt with in Bulletin 253 of the United States Department of Labour Statistics. Lead poisoning is fairly common in America, but before the war few women had been employed in the various lead industries. In England women are barred from lead works. Some German statistics tended to show that women were not really more susceptible than men, but that the sufferers were in general a weakly, badly nourished type of women, not fit for hard work, who drifted into lead works, and that seems to be confirmed to a certain extent in the United States. In the pottery industry more women suffer from lead poisoning than men; but the men belong to a well-to-do trade union and draw good pay, whilst the women have no organisation and are underpaid. In the tile works of the Zanesville district, where men and women are of the same economic class, and badly paid, women show a slightly greater susceptibility. All statistics seem to agree as to the fact that lead poisoning takes peculiar forms in women, and renders them unfit to be mothers, and that they should not be allowed to have anything to do with lead and lead compounds. The danger lies largely also in the deceptive character of the symptoms and in the individual character of the susceptibility. In the same factory one man had worked for thirty-five years in clouds of white lead dust—which should be impossible—and was still hale, while another man fell ill after two weeks, and was dead in five months.

SHALE MINERS' HOURS.—The Scottish shale miners lodged a claim for the seven hours' day granted to the coal miners. A meeting was arranged between representatives of the oil companies and the men, when the representatives of the oil companies stated that they could not see their way to accede to the request. A meeting of the shale miners' executive was held later, when it was agreed to send a deputation to London to lay the matter before the Government.

ZINC AND ZINC DUST PRICES.—No change has been made in the quotation for Australian high-grade zinc dust (88/92 per cent. metallic zinc purity), which remains at £70. per ton f.o.r. Several parcels have changed hands on this basis, and inquiries appear to be more numerous. No further increase has been made in the price of Australian electrolytic zinc (99.95 per cent. metallic zinc), the price remaining at £42. per ton f.o.b. Australia for direct shipment to New Zealand, India, South Africa, and the Far East.

CLEARING HOUSE FOR CASKS.—In view of the widespread attention given to the transport question, the record of the Palm Oil Caskage Clearing House in Liverpool is interesting, says the *Liverpool Daily Post*. Owing to a combination of causes, not the least of which were the difficulties experienced by the brokers in clearing the empty casks on their arrival in Liverpool, the railway companies refused at the close of 1918 to accept empty palm oil casks. As a result of negotiations carried out with the Controller of Oils and Fats (Food Department), a committee of West African merchants and soap manufacturers was formed in order to find a means to overcome the difficulty in regard to the return of the empty palm oil packages to importers. The Committee asked Messrs. Stuart and Douglas, Ltd., to carry out a clearing-house scheme, under the supervision of Mr. Orsini Stuart and staff, and to keep the railway depôts and quays free from congestion, and the trade moving. The first six months' working has proved the benefits of control when carried out with commercial energy and initiative. The Palm Oil Caskage Clearing House (Liverpool) has dealt with 50,000 casks this year from all parts of the United Kingdom, of which about 37,000 have been sorted at and redelivered from the clearing house (representing about 74,000 in and out), and the other 13,000 have been returned to the merchants direct from rail and quay. Congestion no longer exists on the railways, as far as empty palm oil casks are concerned, and the record quoted is one of which the trade and all concerned are justly proud.

EXPLOSIVES.

AT the British Scientific Products Exhibition on Friday (July 18) Mr. J. Young gave an interesting, although more or less popular and elementary, lecture on explosives. The walls of the lecture hall were covered with hanging sheets giving in large educational type information regarding various explosives, and it was not difficult to see that the lecturer's *forte* was that of a teacher. We pick out one or two points of general interest. For instance, the fact that 500 tons of ammonal were employed in the 20 enormous mines which were used to obliterate the Messines Ridge, and that one mine had a crater of 125ft. in diameter gives some conception of the extent to which high explosives were used during the war other than in shells.

Amatol, said Mr. Young, was one of the few real discoveries of the war. It is a mixture of ammonium nitrate and T.N.T. in varying proportions used either in powder form or as a gas. In the latter form it is used in shells, bombs, grenades, and torpedoes. The value of the discovery lay in the fact that there was a shortage of T.N.T., and as only about 20 per cent. of T.N.T. on the average was used, amatol had the effect of doubling our resources of T.N.T.

No matter how much we had of ammonium perchlorate during the war, the supplies were always short, owing to the tremendous quantity required for sea mines, in which also blastine was used to some extent. A mixture of ammonium perchlorate, paraffin wax, and aluminium, however, made an explosive nearly as good as blastine, and an enormous quantity was used for sea mines. Another explosive used when blastine got short was permite, consisting of 82 per cent. NH_4ClO_4 , 10 per cent. zinc dust, 5 per cent. vaseline, and 3 per cent. asphaltum, and varnish. Ammonal consisted of 65 per cent. ammonium nitrate, 15 per cent. T.N.T., 3 per cent. charcoal, and 17 per cent. aluminium filings.

LEGAL INTELLIGENCE.

Carbonate of Soda and Caustic Soda Dispute.

In the Court of Appeal, before Lord Justices Warrington, Duke, and Atkin, on Monday, the case of Chapman and Co., Ltd., v. Agancot was heard upon the appeal of the defendant from an order of Mr. Justice Roche in Chambers.

Mr. Wrottesley, in support of the appeal, said that the defendant appealed from an order of Mr. Justice Roche refusing the defendant unconditional leave to defend the action, imposing the condition that he could not have leave to defend the action unless he brought the whole amount of the plaintiffs' claim into Court within three weeks. Plaintiffs' claim was for the amount due on a bill of exchange accepted by the defendant, and which was given for the amount of freight and other charges on goods sold to the defendant by the plaintiffs, and which were at the time on their way to Italy. The sum claimed was £270. In point of fact the goods never came to the hands of the defendant, but they were sequestered on the frontier owing to the fact that the defendant had become involved in legal proceedings in Italy on former contracts entered into between the partners.

Counsel said that the defendant had a substantial counter claim against the plaintiffs in respect of damages for alleged breach of warranty in respect of 20 tons of carbonate of soda 98 per cent. guaranteed crystal supplied by the plaintiffs to the defendant in 1916, and also in respect of a further 450 tons of carbonate of soda 98 per cent. crystal ordered subsequently. Defendant also had a claim in respect of some soap which the plaintiffs had sold acting as the defendant's agents in December, 1917. In respect of that the defendant claimed an account from the plaintiffs as his agents. Defendant also had another claim in respect of the purchase from the plaintiffs in the autumn of 1917 of 20 tons of 60 to 62 per cent. caustic soda. When it arrived it was not merchantable, and in regard to that heavy claims were made against the defendant in Italy. Defendant asked the plaintiffs to settle those claims, but plaintiffs told defendant to get in touch with the original vendors. Defendant did that, but was told by the original vendors that they could only deal with the parties to whom they sold. Counsel continued that in those circumstances the defendant ought to have unconditional leave to defend the action, as he had a set-off against their claim.

Mr. Jowett having supported the learned Judge's order on behalf of the respondents, their Lordships allowed the appeal, and restored the order of the Master in Chambers, who gave the plaintiffs leave to sign judgment for the amount of the claim, but stayed the levying of execution pending the trial of the defendant's counter-claims.

Foldal Copper Pyrites.

In the King's Bench Division on Monday, Mr. Justice Bray had before him an action under Legal Proceedings Against Enemies Act, 1915, the plaintiffs being Foldal Copper and Sulphur Company, Ltd., of Michael's Alley, Cornhill, London, E.C., and the defendants Duisburger Kupferhuetten A.G., of Duisburg, Rhine Province, Germany.

The plaintiffs claimed a declaration that certain agreements of 1909, 1911, and 1913 for the sale of Foldal copper pyrites were dissolved as from August 4, 1914, by the existence of a state of war between Great Britain and Germany.

Mr. Arthur Sims appeared on behalf of the plaintiffs, and said three agreements had been made between the plaintiffs' company and the defendants. By an agreement of October, 1909, the plaintiffs agreed to sell to the defendants 75,000 tons of Foldal copper pyrites by deliveries of about 15,000 tons during the years 1911, 1912, 1913, 1914, and 1915. There was another agreement in February, 1911, for the sale of 20,000 tons of Foldal copper pyrites, and a further agreement was made in October, 1913, for the sale of 57,000 tons. In August, 1914, there were certain quantities of the goods to be subsequently delivered, and the plaintiffs contended that by the state of war then existing between Great Britain and Germany they were released and absolved from any obligation to supply the Foldal copper pyrites.

Mr. Justice Bray made the declaration in the usual form.

Stafford Coal and Iron Company.

In the Chancery Division on Tuesday, Mr. Justice P. O. Lawrence sanctioned a proposed extension of the objects of the Stafford Coal and Iron Company, Ltd., which gave the company power to deal with its own by-products and manufacture chemicals, cement, gas, and manures, and to set up benevolent funds for its employees.

REPORTS OF COMPANIES.

W. J. Bush and Co., Ltd.

The twenty-second annual general meeting was held in London on July 17, Mr. J. M. Bush (chairman and managing director) presiding.

The Chairman, in the course of his speech, said: The recent increase in the spirit duty up to a total of 51s. 6d. per proof gallon will put essence manufacturers in this country in a most disadvantageous position as compared with their foreign competitors. As soon as freight facilities are restored British manufacturers are almost certain to find that much of their export trade is lost, and the high prices are also likely to cause a smaller demand in the home market. Especially will this be the case in essences in which ethyl compounds are used which have to be made with duty-paid spirits and on which no drawback is allowed. For example, ethyl acetate and ethyl butyrate sell in the United States at one-eighth the price they cost to manufacture in this country at the present rate of duty. Obviously, the remedy is to pay drawback on these compounds, and it is difficult to see the point of view of the Government in refusing so reasonable a request. This situation has been pointed out to the Government by the British Essence Manufacturers' Association. These representations, however, have so far been in vain. All our foreign branches and subsidiary companies, with the exception of Russia, have had a successful year's trading. The sum appearing in the accounts as available for disposal, including the amount brought forward, amounts to £90,257. 19s. 5d., out of which an interim dividend of 5 per cent. has been paid on the ordinary shares. It is now proposed to pay a final dividend of 15 per cent. (making 20 per cent. for the year), to increase the general reserve fund £20,000., and to apply £10,000. to writing down goodwill. This will leave £35,257. 19s. 5d., out of which excess profits duty will be paid and the balance carried forward to next year's accounts.

The report and accounts were adopted.

Borax Consolidated, Ltd.

An extraordinary general meeting was held in London on Tuesday for the purpose of submitting the following resolution: "That the capital of the company be increased from £2,300,000. to £2,900,000. by the creation of 600,000 new deferred ordinary shares of £1. each, to rank equally with the original deferred ordinary shares of the company, and to be issued at such times or time and in such manner and at such premium and generally upon such terms as the directors may think fit." The Right Hon. the Earl of Chichester (the chairman) presided.

The Chairman said: We are at the present time inundated with orders and inquiries for our goods, largely for export. It is evident that, owing to the exhaustion of stocks in many countries, owing to war conditions, there must be a large demand upon us to replenish these, and we anticipate that our mines and refineries will be occupied to their fullest capacity in meeting these demands. That under such conditions more capital must be provided to carry on the business in the most economical manner is evident, and we have most carefully considered, in the interests of the shareholders, the best way to raise this capital, and have come to the conclusion that an enlargement of our deferred ordinary share capital will be the most satisfactory way of providing it. We have confidence that the new capital will enable us to increase our earnings, so that they may correspond to the increased capital, and that if business generally is allowed to carry on we shall be able to show gratifying results.

He then proposed the resolution contained in the notice convening the meeting.

Mr. R. C. Baker seconded the resolution, which was carried unanimously.

British Coalite Company, Ltd.

A series of meetings of the shareholders of the British Coalite Company, Ltd., was held in London on Tuesday for the purpose of passing resolutions providing for the amalgamation of the company with Coalite, Ltd., and Low Temperature Carbonisation, Ltd. Mr. Harry Willmott presided.

The Chairman said: I would assure you that not only has this scheme been the subject of serious consideration by your directors for many months past, but it has been examined with scrupulous care and subjected more than once to the most rigid revision. The directors therefore feel that they can conscientiously recommend it for the acceptance of the shareholders with the certainty that the position of the latter

will be greatly strengthened, and that, as one consequence, the market value of their shares should at no distant date bear a greatly increased and much more equitable approximation to their real value than is the case at present. The chairman concluded by proposing that the scheme for the amalgamation of the company with Coalite, Ltd., and Low Temperature Carbonisation, Ltd., be approved, and that for the purpose of carrying the same into effect the company be wound up voluntarily.

Lieut.-Colonel J. F. C. Hamilton seconded the motion, which was carried unanimously.

A separate meeting of the holders of the ordinary shares was then held, at which a resolution approving of the transfer of the assets and undertaking of the company to Low Temperature Carbonisation, Ltd., and agreeing to accept participating preference shares in that company at the rate of 11 for every 10 ordinary shares of the British Coalite Company, Ltd., was unanimously approved; and at the meeting of the holders of deferred shares a corresponding resolution was also unanimously approved, the proportion of shares in this instance being 17 participating preference shares of Low Temperature Carbonisation, Ltd., for every 20 deferred shares of British Coalite.

Meetings of Coalite, Ltd., were then held, at which corresponding resolutions carrying out the amalgamation were approved.

Cape Asbestos Company, Ltd.

Notwithstanding labour and other difficulties, the Cape Asbestos Company are able to show very satisfactory results for 1918, the net profits for that period amounting to £13,417., as compared with £13,600. and £12,700. for the two preceding years respectively. After adding £5,900., against £4,900., brought forward, there is an available balance of £19,300., against £18,500. last year—an increase of £800. The directors propose to add £5,000., against a similar sum, to reserve, and to pay a dividend of 6 per cent. on the ordinary shares, which compares with a distribution of 5 per cent. for the previous year and 2½ per cent. for 1916. In accordance with the terms of the issue, the preference shareholders are thus entitled to a further distribution equivalent to the dividend on the ordinary shares—viz., 6 per cent. After allowing for the above allocations, there remains a balance of £6,100., against £5,900., to be carried forward.

A. Boake, Roberts and Co., Ltd.

Net profits for the year ended March 31, after providing for debenture interest, depreciation, and excess profits duty, were £31,537. and £18,667. was brought forward. A further dividend of 1½ per cent. is proposed, making 16 per cent. for the twelve months, transferring £5,000. to the reserve (making that fund £75,000.), and carrying forward £6,605.

British South African Explosives Company, Ltd.

Net profits for 1918, after writing off £24,533. for factory depreciation and £1,500. off investments, were £77,648., and £63,565. was brought forward. A dividend of 8½ per cent. is proposed, carrying forward £85,939.

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

Atlas Metal and Alloys Company, Ltd., London, E.C.—Resolved June 20, confirmed July 7: That the company be wound up. H. S. Sugden, 36 and 37, King Street, E.C., and another, liquidators, who are authorised to consent to the Atlas Smelting Company, Ltd., changing its name, with the sanction of the Board of Trade, to the Atlas Metal and Alloys Company, Ltd.

Boundary Chemical Company, Ltd.—Meeting of creditors, H. Sadler's, 31, North John Street, Liverpool, July 25, at 11 a.m.

New Quebec Graphite Company, Ltd.—Resolved June 19, confirmed July 7: That the company be wound up. J. A. Selway, liquidator. Meeting of creditors, 4, Fenchurch Avenue, E.C., July 25, at 11.30 a.m.

Yate Chemical Works, Ltd. (formerly L'Agence Centrale Financiere (The Central Financial Agency), Ltd.), London, E.C.—W. S. Morgan, 3, Pembroke Villas, W. 11, and 18, St. Swithin's Lane, E.C., appointed receiver June 27.

NEW COMPANIES.

Tungsten Manufacturing Company, Ltd.—Private company. Capital £150,000., £1. shares. Manufacturers of tungsten and other metals and articles made therefrom. Office: Thanet House, Strand, W.C.

Whitehall Petroleum Corporation, Ltd.—Private company. Capital £1,000,000., £1. shares. Solicitors: J. Lister, Walsh.

Orchard Sugar Refining Company, Ltd.—Private company. Capital £100,000., £10. shares. Manufacturers, refiners, and importers of and dealers in sugar, syrup, invert sugar, saccharine, laevulose, saccharum, maltose, glucose, caramel, etc. Registered office: Grey Place, Greenock.

Barkershaw Chemical Company, Ltd.—Private company. Capital £1,000., £1. shares. Consulting chemists, chemical engineers, etc. Office: 52a, Heaton Road, Bradford.

F. W. Coombe, Ltd.—Private company. Capital £3,000., £1. shares. Object: To acquire the business of manufacturers of and dealers in glue, gum, and adhesive substances carried on by F. W. Coombe at 8, Arthur Street, E.C., as "Mendine Company," and at 12a, Heron Road, Herne Hill, as "Adhesives Supply Company." Office: 8, Arthur Street, E.C. 4.

Alfred Smith, Ltd.—Private company. Capital £80,000., in 50,000 ordinary and 30,000 6 per cent. cumulative preference shares of £1. each. Object: To take over the business of manufacturing chemists carried on by A., E. and W. Smith, at Excelsior Chemical Works, Clayton, Manchester, as "Alfred Smith," oil refiners, etc.

B. Biggs and Co., Ltd.—Private company. Capital £20,000., £1. shares. Object: To acquire the business carried on at Blondin Works, Old Ford Road, E., by a company of the same name (in liquidation). Makers of methylated spirits, etc. Office: Blondin Works, Blondin Street, Old Ford, E.

Henry Hamilton and Co., Ltd.—Private company. Capital £30,000., £1. shares (10,000 6 per cent. cumulative preference). Merchants, importers, and exporters of oil and general produce. Office: 10, Rumford Place, Liverpool.

James Rudman, Ltd.—Private company. Capital £30,000., £1. shares (10,000 cumulative preference). Paint, varnish, and glue manufacturers, etc. Office: Cambrian Colour Works, River Street, Bristol.

Loftine, Ltd.—Private company. Capital £15,000., £1. shares. Object: To take over the business of manufacturing and dealing in textile detergent compositions for use in wool scouring and other industrial and domestic purposes (particularly the preparation known as "Loftine"). Office: 41, St. Paul's Street, Leeds.

London Metal Company, Ltd.—Private company. Capital £2,000., £1. shares. Office: 5, Laurence Pountney Hill, E.C. 4.

Consolidated Welsh Mines, Ltd.—Capital £300,000., £1. shares. Object: Agreement with W. T. Singleton, of 15, Upper Bedford Place, London, for the sale and purchase of a lease of lead and other mines under certain mine sets in the Cogerriddan Estate, Cardiff. Solicitor: H. Dade, 14, Queen Victoria Street, E.C.

Cornish Meledor China Clay Company, Ltd.—Capital £50,000., £1. shares (15,000 8 per cent. cumulative preference, 15,000 6 per cent. part preference, and 20,000 ordinary). Object: To acquire a portion of Meledor Downs or Common and Meledor Farm, Sun Rising Farm and Break-o'-Day Farm, St. Stephens, Cornwall.

Henry Gardner and Co., Ltd.—Capital £1,000,000., £1. shares. Smelters, rollers, refiners, and manufacturers of and dealers in metals, ores, and metallic and mineral substances, etc. Registered office: 2, Metal Exchange Buildings, E.C.

Resalos Polish Company, Ltd.—Capital £3,000., £1. shares. Office: Reebuck Street, Barnley.

Crosby Trading Company, Ltd.—Private company. Capital £5,500., in 5,000 preference shares of £1. and 10,000 ordinary shares of 1s. each. General merchants, chemical merchants, etc. Office: Alderman House, Bishopsate, E.C.

F. Nickerson and Co., Ltd.—Private company. Capital £10,000., £1. shares. Chemical, druggist, and general merchants. Office: Royal Dock Chambers, Great Grimsby.

Edible Fats (Blackburn), Ltd.—Private company. Capital £3,000., £1. shares (2,998 ordinary and two 5 per cent. preference). Dealers and refiners of tallow and edible fats, bone boilers, etc. Office: Whalley Banks Mills, Blackburn.

Forrest Printing Ink Company, Ltd.—Private company. Capital £15,000., £1. shares. Office: 2-3, Stonecuttet Street, E.C.

Fuelite Company, Ltd.—Private company. Capital £5,000., £1. shares. Object: To acquire the business of a manufacturer of smokeless fuel from coal and coke residues and distiller of tar and rectifier of by-products carried on by W. W. Strafford at "Parkbroke," Hampton-on-Thames. Office: 3, Warwick Court, Holborn.

Harold M. McArthur and Company, Ltd.—Private company. Capital £75,000., £1. shares. Manufacturer and importer of tanning extracts. Office: 327, Vauxhall Road, Liverpool.

Straffon and Co., Ltd.—Private company. Registered July 4. Capital £2,000., £1. shares. Oil and colour merchants, etc. Solicitor: W. G. A. Edwards, 3, Coleman Street, E.C.

United Import and Export Company, Ltd.—Private company. Capital £1,000., 1s. shares. Importers and exporters of general produce, timber, coal, ores, chemicals, etc. First dealers: H. J. Collingwood, 17, Sloane Street, S.W., and W. C. Deere.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W. 1, whence further information may be obtained:—

Sweden.

A firm at Carlstad wish to represent, preferably as sole agents, on a commission basis, United Kingdom manufacturers or exporters of chemicals (particularly those used in pulp and paper-making) and tinplates. (Reference No. 187.)

Spain, Portugal, and Northern Africa.

A Bilbao agent desires to obtain agencies for the whole of Spain for first-class United Kingdom manufacturers of metals, tinplates, galvanised sheets, heavy chemicals, dyes, and any speciality likely to suit the Spanish market, and also for Morocco and the North of Africa and Portugal. (Reference No. 136.)

Argentine Republic.

A firm of agents in Buenos Aires desire to obtain agencies for the Argentine Republic for United Kingdom manufacturers of chemical products and Portland cement. (Reference No. 143.)

Roumania.

A commission agent in Bucharest desires to enter into business relations with United Kingdom manufacturers of chemicals and drugs with a view to representing them in Roumania. (Reference No. 184.)

Italy.

The following inquiries for agencies for United Kingdom manufacturers and exporters from persons and firms in Italy have been received at the British Chamber of Commerce for Italy, 7, Via Carlo Felice, Genoa. All communications regarding the inquiries should be sent to the Secretary of the Chamber, as above:—

A commission agent at Genoa desires to represent manufacturers of chemicals, lubricants, paraffin, etc. (Reference No. 1679.)

A manufacturer at Genoa wishes to take up agencies for chemicals, pharmaceutical products, etc. (Reference No. 1682.)

A commission merchant at Mantova requires the following lines: Chemicals, paints, and dyestuffs. (Reference No. 1693.)

A Genoa agent would represent manufacturers and exporters of heavy chemicals, pharmaceutical products aniline dyes, waxes, gums, oils, glues, drugs, wood pulp, and colonial produce. (Reference No. 1700.)

An agent at Genoa seeks agencies for paints and varnishes, tanning materials, fertilisers, lubricating oils, caustic soda, and drugs. (Reference No. 1701.)

A Genoa merchant would represent, on commission, manufacturers and exporters of dyestuffs and chemicals. (Reference No. 1707.)

A Turin agent seeks agencies for manufacturers of chemicals, etc. (Reference No. 1714.)

A Genoa firm seeks connections with large manufacturers of chemicals and colours. (Reference No. 1716.)

An ex-textile manufacturer wishes for agencies for mineral oil, castor oil, dyes, and chemicals. (Reference No. 1718.)

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS.

(Concluded from page 70.)

CORRESPONDENCE.

*** We do not hold ourselves responsible for the opinions expressed by our correspondents.*

Exports of Chemicals.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir, —With reference to the announcement appearing in last week's issue of your journal, to the effect that all restrictions on the export of chemicals, drugs, and dye stuffs have now been withdrawn, I think it well to draw your attention to the fact that the Order in Council referred to by you had reference only to certain specified chemicals, drugs, etc., and not to all such materials.

The majority of chemicals and drugs have now, of course been removed from the list of prohibited exports, but the export of some chemicals (such as caustic potash, potassium muriate, sulphate, and carbonate), drugs (such as ergot of rye and quinine sulphate), and all synthetic dyes and dye stuffs is still prohibited to all destinations, and shipments can only be effected under licences from the Export Licence Department.

If any exporter is in doubt as to whether any particular chemical, drug, or dyestuff still appears on the list of prohibited exports, information will willingly be accorded to him if he will be good enough to communicate with this Department.—Yours, etc.,

W. H. AMERY, Assistant Secretary.
Board of Trade, War Trade Department, 4, Central Buildings, Westminster, S.W. 1., July 21, 1919.

CORRESPONDENCE.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

The specifications of the following applications are not printed by the Patent Office until the complete specifications have been accepted.

July 14th to July 18th (inclusive).

Heating Material or Performing Chemical Processes in Electrical Furnaces. Aktiebolaget Kvalveindustri. 17,821.
Purification of Argon, etc. Barbet et Fils et Cie, E. 17,706.
Preparing Barium Hydroxide from Barium Sulphide. Barnes, E. A. 17,991.
Roasting Sulphide Ores, Products, etc., and Manufacture of Sulphuric Acid, Sulphurous Anhydride, and Acid Sulphites and Bisulphites Therefrom. Boyd, J.; and Durant, H. T. 17,642.
Treatment of Emulsions, etc. Broadbridge, W.; Edser, E.; and Minerals Separation, Ltd. 18,038.
Chemical Product Obtained from β -naphthol. Brett, A. H. 17,589.
Removal of Gases from Liquids. Elliott, W. S. 17,931.
Superphosphates, etc. Guillaume, F. 17,752.
Drying China Clay, etc. Kent F. J. 17,986.
Bismuth Compound. Kent, T. O. 17,838.
Refining Lead. Leathart, T. H.; and Locke, Blackett, and Co. 17,785.
Applying Nickel Carbonyl in Manufacturing Processes. Lessing, R. 17,709.
Extraction of Fat, Wax, Oil, Gelatine, etc., from Materials. Macgregor, J.; and Scott and Co., E. 17,880.
Elimination of Carboxyl Groups. Marsh, J. E. 17,633.
Treatment of Zinc Solutions. Metals Extraction Corporation; and Petersson, F. 17,929.
Reduction of Nitro, Nitroso, and Azo Compounds, etc. Moore, T. S. 17,568 and 17,963.
Hydroxyazo Dyes. Morgan, G. T. 17,848.
4-nitro- β naphthol. Morgan, G. T. 17,849.
Destructive Distillation of Wood, Woody Fibre, etc. Poore, P. 17,728.
Extraction and Recovery of By-products formed by Destructive Distillation of Wood in Suction Gas Plants. Roberts, J. C. 17,547.
Recovering Bitumens from Shale, etc. Ryan, H. D. 17,777.
Manufacture of Ethyl Alcohol and Residue from Fermented Liquor. Wade, H. (Schneible). 18,041.
Recovering Oil from Shale, etc. Wallace, G. W. 17,810.
Distilling Carbonaceous Materials. Wallace, G. W. 17,811.
Condenser for Distilling Apparatus. Zaeckel, J. H. 17,796.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C.

1917.

Preparation of Lead Acetate. Camus, E.; Duchmine, R.; and Criqueboeuf, G. 6,549. 129,300
Manufacture of Monochloroacetic Acid and of Its Esters. Simon, L. J.; and Chavanne, G. 7,325. 129,301
Nitric Acid and Ammonium Sulphate. Cocking, A. T.; and Kynoch, Ltd. 14,431. 129,305
Nitro-phosphate Fertilisers. Cocking, A. T.; and Kynoch, Ltd. 14,432. 129,306
Removal of Sulphur from Oils. Forwood, G. F.; and Taplay, J. G. 15,672. 129,349
Reducing Iron Ores. Merturi, G. Jakova-. 15,768. 129,354
Continuous Production of Picric Acid or Other Products of Nitration. Brooke, J. N. 16,431. 129,375

1918.

Metallic Lead Powder and Lead Paints. Nelson, J.; and White, W. C. 6,065. 129,392
Treatment of Coal-tar, Pitch, and the Like for the Production of Fuel. Pearson and Son, S.; Smith, J. S.; and Hackford, J. E. 6,280. 129,393
Dye Compositions. Marks, E. C. R. (Sunbeam Chemical Co.). 11,078. 129,417
Low Carbon-ferro-manganese. Hadfield, Sir R. A. 11,198. 129,426
Coke-ovens. Marr, J.; Colquhoun, W.; and Coke Oven Construction Company. 11,256 and 11,257. 129,432 and 129,433
Disintegrating and Screening Pulverulent Material. Fraser, L. M.; and Peel, F. 11,730. 129,458
Hydrogenation of Fats and Oils. Martin, G. 11,762. 129,461
Producing Metallic Cerium and Similar Rare-earth Metals or Alloys Thereof. Alpha Products Company. 14,238. 119,229
Flexible Waterproof Antiseptic and Antifouling Composition. Kelly, M. A. 15,940. 129,526
Filamentous Material from Viscose. Pellerin, A. 21,084. 121,734

1919.

Evaporating or Concentrating Liquids. Shaw, E. 3,238. 129,584

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Nitrophenols. D. B. MacDonald, Leicester; and J. Calvert, Huddersfield. British Patent, 126,062, of 1916.

Nitrophenols are obtained by treating benzene with nitric acid and mercuric nitrate in the presence of carbon dioxide;

2:4-dinitrophenol is the principal product. The process may be carried out by passing carbon dioxide into the mixture of benzene, nitric acid, and mercuric nitrate, or by passing carbon dioxide through nitric acid and leading the mixed vapours into the mixture of benzene, nitric acid, and mercuric nitrate, or by passing carbon dioxide through benzene and leading the mixture of carbon dioxide and benzene vapours into a mixture of nitric acid and mercuric nitrate. The benzene, nitrobenzene, and *o*-nitrophenol are separated from the dinitrophenol by evaporation or steam distillation.

Catalytic Manufacture of Nitric Acid. E. B. Maxted and G. R. Ridsdale, Walsall. British Patent, 126,083, of 1916.

The catalytic oxidation of ammonia to nitric acid or nitrogen oxides is effected by arranging a constant supply of heat of suitable temperature at every point of contact between the gases and the catalyst, followed by cooling the reaction gases as soon as they leave the catalyst. The gases may be passed through iron tubes of small bore, or through iron tubes which have been flattened to the form of a hollow tape, or between iron plates in loose contact or a short distance apart, the tubes, etc., being externally heated, for instance, by a flame or electrically to a red heat, and the time of contact being a fraction of a second. Nickel or cobalt—or, according to the provisional specification, copper or platinum—may be used instead of iron, and the inner surfaces of the tubes may be activated in any known manner, for instance, by treating with a solution of copper, tungsten, cerium, thorium, bismuth, or lead nitrate; or, according to the provisional specification, by coupling with copper or silver. The tubes may be enclosed in sleeves of silica, porcelain, etc.

Ammonium Nitrate. D. Tyrer, Stockton-on-Tees. British Patent, 125,621, of 1916.

Ammonium nitrate is obtained by double decomposition between approximately equivalent quantities of ammonium sulphate and sodium nitrate, the reaction mixture being boiled to precipitate most of the sodium sulphate—i.e., until the boiling point rises to 120° C.; the sodium sulphate is filtered off hot, and washed with a saturated solution of sodium sulphate, and then with water, the ammonium nitrate solution, preferably after a small addition of water, is then treated with a salt of a metal forming an insoluble sulphate, such as calcium or barium nitrate or chloride, so as to convert a part of the remaining sodium sulphate into a more soluble salt; the calcium sulphate, etc., is filtered off and washed, and the ammonium nitrate solution is concentrated until its boiling point is about 120-125° C., and cooled to effect crystallisation, which takes place at from 35-15° C. The ammonium nitrate crystals are washed in concentrated ammonium nitrate solution, and dried at 100° C., and may be purified by crystallisation. The mother-liquor is used, after addition of water, for dissolving fresh ammonium sulphate and sodium nitrate. The first washings of the sodium sulphate, when enough ammonium nitrate has accumulated, are boiled to precipitate sodium sulphate and filtered, and the filtrate is added to the principal mother-liquor. The washings of the sodium sulphate with water may be used as the saturated solution in subsequent operations. The washings of the calcium sulphate precipitate may be used to dilute the ammonium nitrate solution prior to the addition of calcium nitrate. The washings of the ammonium nitrate may be concentrated to crystallise out some of the salt, and the mother-liquor added to the principal mother-liquor.

Ammonium Perchlorate. C. W. Bailey, H. S. Denny, and A. J. Dunk, H.M. Factory, Langwith. British Patent, 125,677, of 1918.

Relates to the production of ammonium perchlorate by the interaction of ammonium sulphate and sodium perchlorate in the presence of water. According to the invention, sodium perchlorate is added to the mother-liquor obtained by causing ammonium sulphate and sodium perchlorate to react in the presence of water at about 30-35° C., the temperature is raised to about 100° C. to cause the separation of anhydrous sodium sulphate, and ammonium sulphate is then added to the residual solution cooled to about 30-35° C. to effect the precipitation of ammonium perchlorate; the mother-liquor obtained is then treated in succession with sodium perchlorate and ammonium sulphate as set forth above.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Halohydrins. Commercial Research Company, New York. British Patent, 126,311. Convention date, May 3, 1918.

In making halohydrins by the action of hypochlorous or hypobromous acid upon gaseous olefines, the acid is prepared by reaction of halogen gas upon water in the presence of a substance which reacts with hydrochloric or hydrobromic acid but not with hypochlorous or hypobromous acid, yielding a solution containing practically no free halogen or hydrochloric or hydrobromic acids. Suitable substances are salts of weak acids, such as carbonates, bicarbonates, acetates, or borates, or acid salts of strong acids such as disodium phosphate. Insoluble salts such as calcium borate or calcium carbonate in the form of soft limestone or pressed blocks of precipitated chalk may be used. Gases containing mixtures of saturated and unsaturated hydrocarbons such as are obtained by destructive distillation of petroleum products or alcohol may be treated. As propylene is reacted upon first, the operation may be conducted in stages to obtain first propylene chlorhydrin and then ethylene chlorhydrin. Hypochlorous acid is prepared by passing chlorine through inlets H into a chamber B containing granular material, which may consist of calcium borate or calcium carbonate, over which is distributed a solution of a salt of a weak acid, such as borax, prepared in a vessel G. The solution of hypochlorous acid passes through water-seals a and falls in a shower through a chamber C, through which a current of gas containing olefines passes from an inlet L to an outlet M. The liquid flows into a tank K, in which it is cooled to remove boric acid, and may be passed through the same or a similar apparatus. The chlorhydrin is separated by distillation or by extraction with ether, gasoline, carbon tetrachloride, or other solvent.

Catalytic Apparatus. Soc Chimique des Usines du Rhone, anciennement Gilliard. P. Monnet et Cartier, Paris. British Patent, 126,279. Convention date, May 3, 1918.

In apparatus for catalytic gaseous reactions, the gases pass through a catalyst which is of such material as can be directly heated by the passage through it of an electric current. To this end, the catalyst may itself be an electric conductor; or if not a conductor, conducting material may be incorporated with it. The container for the catalyst is of non-conducting material. The reactions cited as examples comprise the combination of acetaldehyde and air at 100° C. to give acetic acid, the dehydration of alcohol vapour at 360° C. producing ethylene, and the production of acetone from acetic acid at 460° C., the catalyst in each case being either granulated coke or a mixture of powdered charcoal and alumina, directly heated by an electric current to the requisite temperature.

Alkali Nitrates. F. Bensa, Genoa, Italy. British Patent, 125,453. Convention date, August 4, 1915.

Ammonia is oxidized to nitrogen oxides by the catalytic action of platinized or palladized asbestos followed by the action of layers of the oxides of copper, iron, and rare metals such as thorium, cerium, and didymium in the presence of steam. The nitric and nitrous acids produced are absorbed in solid alkali carbonates or hydrates at a temperature above the melting-point of the nitrates.

Paints, Varnishes, Etc. M. Holzapfel, Newcastle-on-Tyne. British Patent, 126,270. Convention date, May 3, 1918.

A composition adapted for use in the production of paints, varnishes, etc., is prepared by heating wood tar in the presence of basic metal compounds, such as lime, under oxidising conditions, with or without additions of zinc oxide, red lead, litharge, manganese oxide, or similar driers. For example, 90 parts of wood tar, 5 parts of slaked lime, and 5 parts of zinc white are mixed together and heated to about 250° C. for about half an hour, the product being then dissolved in turpentine, benzene, or other hydrocarbon to the consistency

of a varnish or paint oil. The product may be ground up with pigments for the manufacture of paints. During the heating process, a current of air or oxygen may be passed through the mixture. When light-coloured paints, etc., are required, the wood-tar is distilled before use to remove the pitch. A small proportion of whale oil, fish oil, or other fats or fatty acids may be incorporated with the mixture at any stage of the manufacture.

Zinc Sulphides. P. Comment, Dijon, Cote d'Or, France. British Patent 126,274. Convention date, April 30, 1918.

In the production of zinc sulphide by calcining zinc persulphide, ZnS₂, with zinc sulphate and alkali sulphate as described in the parent Specification No. 106,489 and in Specification 114,407, the alkali sulphate may be wholly or partly replaced by an alkali salt capable of producing the sulphate under the reaction conditions, such as sulphite, hyposulphite, or thionate, and the zinc persulphide by a zinc polysulphide containing less sulphur such as may be produced by precipitating a zinc salt with various amounts of alkali or alkaline-earth polysulphide, or by removing some sulphur from zinc persulphide by treatment with solutions of alkalies or alkali or alkaline-earth sulphides. When alkali sulphide is produced as well as sulphate from the salt employed, the zinc sulphate must be sufficient to form zinc sulphide with such sulphide.

Benzene Monosulphonic Acid. Compagnie des Produits Chimiques d'Alais et de la Camargue, Salindres, Gard, France. British Patent, 126,039. Convention date, February 25.

In the production of benzene monosulphonic acid as described in the parent Specification No. 101,793, the benzene vapours are passed through a superheater before entering the sulphonator. Using the apparatus shown in Fig. 1, the

Several continuous treatment apparatus may be arranged in series with a common benzene boiler, the first sulphonator only being fed with sulphuric acid and delivering its sulphonated product to the next sulphonator, and so on; this arrangement permits more complete utilisation of the sulphuric acid.

Methyl Alcohol. J. A. Christiansen, Copenhagen. British Patent, 125,946. Convention date, April 20, 1918.

Methyl alcohol is obtained by reducing an alkyl formate by hydrogen in the presence of a catalyst, such as copper; methyl formate is a suitable parent substance. Methyl formate for use in the process may be made by reaction of carbon monoxide with methyl alcohol under pressure in the presence of sodium methylate, or by passing carbon monoxide into a solution of sodium methylate in methyl alcohol. By combining the processes above described, methyl formate or methyl alcohol can be obtained from the constituents of water gas.

WAGES IN THE RUBBER INDUSTRY.—Women and girl workers engaged in the indiarubber industry of the kingdom have been awarded increases of wages of 5s. and 2s. 6d. respectively, those over 18 years getting the larger sum and those under getting the smaller one. Pieceworkers get an advance which dates back to the first full pay following June 1.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—The report of the Alianza Company, the largest of the English producers, affords an interesting object-lesson on the Chilean nitrate industry, which will be reviewed in detail in next week's issue of this journal. The financial results last year were the best obtained in the 23 years of the company's existence, the gross profit amounting to £480,571.—or about 4s. 9½d. per quintal on 2,010,799 quintals disposed of; the net profit, after deduction of £46,470. for raw material extracted, £65,322. for debenture interest, income tax, etc., and £4,817. for London expenses, was £363,962., compared with £261,388. in 1917. For the second time in succession, a dividend of 40 per cent., free of income tax, is paid on the share capital of £500,000. The Hon. Herbert C. Gibbs, presiding at the general meeting on the 17th instant, explained that a larger distribution would have been made but for the necessity of providing for the excess profits duty (about £50,000.) and the cost of upkeep of one oficina closed and the other likely to follow suit; he further stated that the company had since 1898 distributed £1,690,000. in dividends, returned to the shareholders in 1903 half their capital in cash and debentures (only £99,700. of the latter now outstanding), formed reserves of £246,739., built a new oficina, and acquired new grounds estimated to contain 26 million quintals of nitrate. To finish the picture of phenomenal prosperity the amount "carried forward" to the current year is £299,899., equal to about 60 per cent. of the share capital. Somewhat in the nature of an anticlimax comes the "Alianza's" renewed protest against the payment of income tax upon depreciation funds, seeing that the enormous profits made in the last two years were entirely on sales to the Allied Nitrate of Soda Executive, to which the company's chairman acted as adviser. Equally if not more surprising is the removal of the control to Chili for the admitted purpose of "protecting the foreign shareholders from British taxation." They may find that they, as also their English co-partners, have fallen from the frying-pan into the fire if the Chilean Government carry out the reported intention of replacing the export duty on nitrate by a tax on profits.

Continental Fertiliser Items.—By a decree of July 15, new prices have been fixed for fertilisers in Italy. Per unit of phosphoric anhydride, the price is 1.37 lire, free in wagons Genoa, Leghorn, and Taranto; 1.38 lire, free in wagons at Barletta and Ancona; 1.39 lire, free in wagons at Ravenna; 1.40 lire, free in wagons at Venice. These are the same prices as those recently fixed by the Unione Italiana Concimi, and are very much lower than the old fixed prices, which averaged 1.55 lire per unit.

A considerable improvement is noted in the exportation of Tunisian phosphates for the month of June. This amounted to 26,526 tons, as against 12,336 tons in June, 1918. This makes a total for the first six months of 1919 of 92,490 tons, as against 58,616 tons only during the corresponding period of 1918—an increase of 33,874 tons.

According to French advices, the potash concerns in Alsace that were subsidiary to the German Potash Syndicate will be exploited by a single French company, the capital of which it is intended shall be 50,000,000 francs.

Sulphate of Ammonia.—Not a great deal of business is moving in this material, but the fixed prices appear to have been readily accepted, and may be regarded as fair. Talk of increased production moves from time to time, but there are no special details of moment here. With regard to sulphate of ammonia business in America, news from the Pacific Coast is to the effect that active work in the field is expected to boom the demand for sulphate of ammonia in the coming autumn. Price conditions locally hold back business there at the moment.

Basic Slag.—The rumours of higher prices for basic slag have become again more prominent in connection with dearer coal and consequently dearer iron. Furthermore, the market is apprehensive that the supply may be adversely affected. At the moment there is a fair inquiry for forward, and quite a number of orders are being placed early. This is probably wise in view of what may happen.

Bone Meal.—Bone meals continue to be dear and fairly scarce. Representative prices are £8. for a dissolved bone compound, August delivery, or £8. 2s. 6d. for September delivery. East Indian bone meal is quoted at round about £15. per ton.

Pacific Phosphates.—The chairman of the Pacific Phosphate Company, at a meeting last week, referred to the statement

that a mandate in respect of the important phosphate-bearing island of Nauru had been given to the British Empire. This company and its predecessors have been the pioneers of the phosphate industry in the Pacific Ocean, and they are naturally interested as to what is to happen to these ex-German deposits. It was this company that discovered the phosphates in Nauru, and, by arrangement with the German trading company operating there, obtained an exclusive concession until the year 2000 to work the deposits and any others which might be discovered in the Protectorate. At the same time the rich deposits in Ocean Island were also discovered, and the British Government granted the company an exclusive concession to mine these phosphate deposits until the year 2000. The Pacific Phosphate Company's German shareholdings have during the war been sold to a British corporation by auction. All the ground appears to be cleared for a straightforward progressive policy of exploitation.

Other Fertilisers.—The general fertiliser market is quiet, but there are one or two interesting points. From one source sales of fish guano at £18. to £19. 10s. are mentioned, this material analysing 9 per cent. ammonia and 14 per cent. phosphoric acid. Kainit is again very scarce, but there is more sulphate of potash available at prices as last quoted. In America it is said the potash market is almost stagnant, in spite of certain potash material being offered as low as two dollars per unit. Makers of combined manures are believed to have considerable potash on hand, and the demand is therefore small. The French market is now reported to be regularly quoting cyanamide, nitrate of lime, and nitrate of ammonia. The superphosphate position is without change.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

Trading conditions are becoming chaotic owing to the numerous sectional strikes that spring up day by day, and, in a great measure, to the uncertainty regarding the prices of fuel. Manufacturers absolutely refuse to quote for any large quantities of their productions, and the business transacted in any industry is confined to small limits.

Tinplate manufacturers are much concerned as to their markets, and there are grounds for their fears that many important consumers of plates will be driven elsewhere for their supplies. Hitherto all disputes between masters and men have been settled with the help of a conciliation board, but during the last few days a few of the extremists have taken upon themselves to have an unofficial ballot, the principal question on the paper being, "Are you in favour of an unofficial strike throughout the tinplate trade against the recent findings of the Industrial Council?" Many of the papers have been returned, and these are said to be favourable to the "down tools" policy, and possibly in a few days this industry will be stopped. The men claim that 50 per cent. of the present war bonus should be added to the standard wages, and the remainder retained while the high cost of living continues. The position is fraught with very serious consequences.

The demand for spelter has increased, but this is not so difficult to meet, as there are stocks on hand. There is some difficulty in this industry owing to the employment of Belgians. Employers have explained the position which made Belgian skilled labour necessary at a recent meeting of the Industrial Council, and consideration of the question was adjourned; but during the last few days the speltermen have been holding meetings, and statements have been made that some 24 men from one works received notice, and meanwhile 14 Belgians were brought over. This alleged grievance has resulted in a strike at two of the leading factories.

Coke ovens are working regularly, and at present the supply of sulphate of ammonia has not appreciably decreased, but the outlook is not of a very promising position owing to the coal situation.

The patent-fuel makers, although in a somewhat better position as regards supplies of duff and small coal, are uneasy as to the future. This industry during the war has made considerable progress, but the extra charges for coal are now having a serious effect.

A cargo of 2,000 tons of sulphur ore from Seville came into Swansea Docks on Monday for Messrs. Vivian and Sons.

COURTAULDS, LTD.—Interim dividend of 4s. per share, free of income tax.

MARKET REPORTS.

TAR AND AMMONIA PRODUCTS.

WEDNESDAY.

Benzole: London, 90%, 1s. 11d. to 2s.; North, 1s. 9d. to 1s. 10d.; 50%, 1s. 9d. to 1s. 10d.; North, 1s. 9d., naked. Carbolic acid, crude, 60%, East and West Coast, nominally 1s. 3d.; crystals, 30-40%, 6d. to 6½d., f.o.b. Crude tar London, 42s. to 43s.; Midlands, 37s. to 38s.; North, 36s. to 37s. per ton, ex works. Pitch, 72s. 6d. to 75s.; East Coast, 65s., f.o.b.; West Coast, 52s. to 54s., f.a.s. Solvent naphtha, naked, London, 90-190%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 90-160%, naked, London, 2s. 1d.; North, 1s. 10d. to 1s. 11d. Crude naphtha, naked, 30%, 8d. to 8½d.; North, 7½d. to 7¾d. Refined naphthaline, £18. to £22.; salts, £6. to £7. Toluol, naked, London, 2s. 1d.; North, 2s. Creosote, naked, London, 5½d. to 5¾d.; North, 5d. to 5½d.; heavy oil, 6¾d. to 7d. Anthracene, 40-45%, 6d. per unit. Cresylic acid, 95%, 2s. 7d. to 2s. 8d.; 97-99%, 2s. 9d. to 2s. 10d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: Home trade, £19. 10s. per ton; basis 24½%. Nitrate of soda, £21. to £22.

FERTILISER MATERIALS.

LIVERPOOL, THURSDAY.

Nitrate of soda is easier on spot, and the price of 96 per cent. quality has been reduced to £20. 12s. 6d. per ton, net cash, f.o.r., prompt delivery. East Indian bone meal: Shippers are very firm in their views, the nearest value of 4½ per cent. ammonia and 52 per cent. phosphate of lime, August-September shipment, being £14. per ton, net cash, ex ship Liverpool. On spot, holders ask £15. per ton, net cash, for 4½ per cent. and 45 per cent. quality. Mineral Phosphates: Some business is reported to have been done in 63 per cent. grade Tunisian rock at 8½d. per unit, f.o.b. Tunis, July-August shipment. Dried blood is quiet, the value being 25s. to 30s. per unit of ammonia per ton, net cash.

LONDON METAL MARKET.

THURSDAY.

Copper: Standard brands, £103. 15s. to £104., cash; £104. to £104. 10s., three months; electrolytic, £110. to £120. Tin: Standard, £255. 10s. to £255. 15s., cash; £254. 5s. to £254. 10s., three months; Straits, £225. 10s.; English, £252. to £253., f.o.r. Lead: Soft foreign, £23. 10s.; English, £24. 10s. Spelter, £43.; hard, £34. to £35. Antimony, English regulus, 90%, £40. Aluminium, £150. Nickel, £205., delivered, packages extra. Quicksilver, £22. to £22. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 30s. per unit.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

Business in the home trade during the past week has been on the quiet side, but the inquiry for export is, as a whole, satisfactory, and values all round are fairly well maintained. Resale lots of 70% caustic soda are still available at £17. 10s. per ton. Refined bicarbonate of soda, in bags, at £7. per ton, and 58% alkali at £6. 10s. per ton. Bleaching powder quiet at £15., softwoods, on rails. Hardwoods, £14. per ton, f.o.b. There is no improvement in demand for copper sulphate, and price is nominal at £45. per ton, f.o.b., Liverpool. Chlorate of soda again lower at 7d. Potash easy at 1s. 1d. per lb. Bichromates unchanged at 1s. 6d. and 11d. for potash and soda respectively. Roasted saltcake, in bulk, 60s. per ton, delivered. Phosphate of soda steadier at £25. per ton. Commercial hyposulphite of soda slow of sale at £16. 10s., on rails. Nitrite of soda lower at £53. per ton. White powdered arsenic continues scarce, and £40. is quoted for small lots of Cornish make. Yellow prussiate of potash quiet and unchanged at 1s. 9d. per lb. Soda is selling rather better at 7½d. per lb. Carbonate of potash, 80-85%, steady at £85. per ton, but not much inquiry. Lead salts are a shade easier: White acetate, £84. per ton; brown, £75. per ton. Nitrate, £56. 10s. per ton. Acetic acid and acetate of soda are in steady request at recent rates. English brown acetate of lime firm at £10. per ton. American grey, £19. 10s. net, ex ship. Miscible and solvent wood naphtha quiet at 10s. 6d. per gallon. Green copperas is in better demand, but price easy at £4. 10s., carriage paid. Oxalic acid unchanged at 1s. 2½d. per lb.

SWANSEA MARKET REPORT.

THURSDAY.

Tinplate prices are fairly steady, but the volume of business passing is of a meagre description owing to the uncertainty of the future prospects of getting raw material. Standard boxes were quoted at 33s. to 34s., f.o.b. There is a better demand for copper, and prices are somewhat irregular, with an upward tendency. Some sales for delivery over current quarter at £104. were recorded. Tin has a steady inquiry, and is slightly dearer at £256., prompt, with 5s. to 10s. less for three months. Silver, 54½d. per ounce. Zinc sheets remain quiet and unchanged at £65., f.o.b., New York. Lead: Spanish, £23. 15s.; English, £24. 15s. Spelter, with more inquiry, was dearer at £43. 15s. prompt and £45. three months. Linseed oil scarce at nominal quotations. Cottonseed oil steady, with edible at 135s. per cwt. Palm oil is firmly held notwithstanding poor inquiries: Lagos was quoted at £92.; softs, £91. 10s.; Benin, £88.; and hards, £82. per ton, casks free. Turpentine, better sales at 95s. 6d. per cwt., net, in barrels. Sulphate of copper rather dull at £45. per ton for home purposes, and £47. 5s. for export, less 5 per cent., in casks, f.o.b. Arsenic in better request, with irregular quotations round £42. to £44. per ton. Oxalic acid unchanged at 1s. 3d. per lb. Pitch, with short supplies, dearer at 5½s. 6d. per ton. Nitrate of soda firm at 2½s. 6d. per cwt., in bags, net. Bone meal dearer at 14s. 3d. per cwt. Sulphate of ammonia, £19. 10s. per ton.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

The demand for chemicals for use in the United Kingdom has again been quiet. The market has been disturbed by the uncertainty as to supplies and prices of coal, not only as regards the chemical industry but as regards most other industries. Great dissatisfaction has been caused by the increase in the price that has been announced and by the shortage in the supply, both being caused by the refusal of the miners to bring more than a certain insufficient quantity of coal to the surface. The situation is regarded as not one of legitimate scarcity, but of refusal of those who have been producers of coal in the past, and who have lately been earning at least double their pre-war earnings, to produce sufficient coal for ordinary requirements. All industries alike are affected by the uncertainties of the situation, and everyone is denouncing the selfishness of those who are endangering the trade and stability of the country by the course they are now pursuing. Bleaching powder has been in moderate request, and is £14. 10s. to £15. per ton, free on rail or conveyance, in buyer's packages, and £17. per ton for export. Chloride of calcium has been quieter, and is £8. to £11. per ton, in casks, f.o.r. Caustic soda has been in good request, and is £24. per ton for 76 per cent., £22. per ton for 70 to 72 per cent., and £19. per ton for 60 to 62 per cent. Nitrate of soda has been in quietly steady demand, and is £20. to £21. per ton. Saltcake has been in fair request, and is £6. 10s. per ton, in casks, f.o.b. Soda crystals have been steadily called for, and are £5. per ton, in 2cwt. bags, f.o.r., at works. Bicarbonate of soda has sold with some freedom, and is £7. 5s. to £10. per ton, according to terms of delivery. Borax has been in very fair demand, and is £42. per ton for ordinary and £44. per ton for powdered, in bags. Ammonia alkali continues in good request, and is £6. to £6. 5s. per ton, f.o.r., at works. Hyposulphite of soda has again met with a fair inquiry. Ordinary crystals are £19. to £20. per ton, in 2cwt. bags. Pea crystals are £25. per ton, in 1cwt. kegs. Sulphite has been in quietly steady demand, and is £11. per ton for ordinary and £18. to £19. per ton for pea crystals, in 1cwt. kegs. Bichromate of soda has moved but slowly, and is 9d. per lb. Phosphate of soda has been quiet, and is £25. per ton. Sulphide of sodium has been in fair request, and is £20. per ton, in casks, and £22. per ton, in drums. Chlorate of potash continues to meet with a moderate inquiry, and is 1s. 1d. to 1s. 2d. per lb. Permanganate of potash has been quieter, and is 3s. 6d. per lb. Sulphate of potash has been but little called for, and is £40. per ton. Carbonate of potash has been in very fair demand, and is £85. to £90. per ton for 80 to 85 per cent. Caustic potash has been quieter, and is £90. to £100. per ton for 35° Bé. Nitrate of potash has been steadily called for, and is £58. to £60. per ton for refined and £40. per ton for ordinary. Canadian ashes have been very quiet, and are £200. to £220. per ton.

for first quality, Montreal, and £190. to £210. per ton for second quality. Bichromate of potash has been quiet, and is 1s. 6d. to 1s. 7d. per lb. Yellow prussiate of potash has been but little called for, and is 1s. 9d. to 1s. 10d. per lb. Salamoniac has had a moderate inquiry, and is £80. per ton for lump, £75. per ton for seconds, and £5. per ton extra for ground. Sulphate of ammonia has been very quiet, and is £19. 10s. per ton, less traders' discount of 10s. per ton, free to nearest wharf or railway station, to September 30. Carbonate of ammonia has been rather more in request, and is 6½d. per lb. Muriate has been in very limited demand, and is £50. to £60. per ton, according to quality. Magnesia has been quieter. Carbonate is £3. 10s. per ton, and sulphate £10. to £16. per ton, according to grade. Alum has been in very fair request, and is £18. 10s. per ton for the home trade, and £18. 10s. to £19. 10s. per ton for export. Alumino-ferric has received but little attention, and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina has again been quiet, and is £12. to £18., according to grade. Sulphur has been in moderate demand. English kinds are: Flowers, £32. per ton; roll, £28. per ton; and rock, £22. per ton, in bags, f.o.r. Sicilian grades are: Flowers, £28. per ton; roll, £22. 10s. per ton; and third quality, £17. 15s. per ton. Cream of tartar has been in very fair inquiry, and is £11. 5s. to £11. 10s. per cwt. Tartaric acid has been quieter, and is 3s. 2d. per lb. Boracic acid has been rather more in demand, and is £72. per ton for crystals and £74. per ton for powdered. Oxalic acid has been quiet, and is 4s. 4d. per lb. White acetate of lead has moved but slowly, and is £85. to £90. per ton. Arsenic has been in quietly steady demand, and the price has further advanced. It may be given as £50. per ton for white powdered. Sulphate of copper has been but little called for on home trade account. For agricultural uses in the United Kingdom it is £45. per ton, and for export £47. to £48. per ton, less 5 per cent., in casks, f.o.b., at Liverpool.

TYNE CHEMICAL REPORT.**TUESDAY.**

Chemicals are unchanged. The demand is steady, and consumption in the home trade is improving somewhat. The recent railway strike has interfered with deliveries to a certain extent, but with the resumption of work to-day matters in this respect will soon improve. Bleaching powder

and caustic soda are in good request. Sulphur continues very scarce and firm at £22. to £23. per ton.

The following prices are per ton, net: Bleaching powder, softs and hards, £15.; caustic soda, 74-77%, £23. 5s.; do., 70%, £22.; do., 60%, £20.; recovered sulphur, 2cwt. bags, £23.; hyposulphite of soda, 5-cwt. casks, £19.; do 1cwt. kegs, £25.; sulphite of soda, 5-cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75° Tw., £9. 12s. 6d.; do 100° Tw., £10.; do., 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5.; sulphate of soda (saltcake), in bulk, £3. 10s.; pure white sulphate of alumina, 14-15%, £19. 10s.; blanc fixe, £22.; chloride of barium, £27.; sulphide of sodium, crystals, £18.; do., refined concentrated solid, 60-62%, £25.; hydrate of barium, crystals, £56.

COALS.—Most of the collieries in Durham and Northumberland have been on holiday owing to the peace celebrations, and the coal trade has also been affected by the local railway strikes by reason of the shortage of empty wagons, and a great quantity of tonnage is now awaiting cargoes. Quotations remain very firm. Allies quotations:—Best steam coals, 70s.; best steam small, 45s.; seconds steam coals, 65s. Coke continues in heavy request, and quotations are very firm.

WEST OF SCOTLAND CHEMICALS.**GLASGOW, Wednesday.**

This is Glasgow trades holiday week, and consequently business in the chemical and all other industries locally may be said to be more or less at a standstill. All works are closed down (except in cases of extreme urgency) for the full week, and it will be well into the coming week before business gets back to its normal again. In the circumstances prices for heavy chemicals are scarcely quotable, but the range as given in last issue may, generally speaking, be said still to hold good.

In the sea oil section there is the same holiday inactivity. When the market opens out again next week, however, white oils should still be round about their old figures (80s. for brown and 78s. for black), with Newfoundland cod keeping near to the old quotation of 75s.

Conditions in the coal trade are unchanged, but, of course, the cessation of work industrially in Glasgow and district has materially affected the demand. Export conditions continue quiet.

IMPORTS OF CHEMICAL PRODUCTS**AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.****BRISTOL.**

Publication of Official Returns
Suspended.

GLASGOW.

Week ending July 18.

ALUMINA SULPHATE—
Philadelphia, 56 brls.

BARYTES—

Bombay, 1 cs. (F.), £7.; Colombo 1 c., £25.; Constantinople, 2 c., £65.; Durban, 3 c., £85.; Georgetown, 1 cs. (pt.), £6.; Kilindini, 1 c., £14.; New York, 5 t., £2,300.; Rio de Janeiro, 5 c., £159.; Rotterdam, 9 c., £169.; Rotterdam, 5 c. (F.), £119.; Zanzibar, 1 c., £26.

COAL PRODUCTS—

Alizarine
Barcelona, 17 pkgs., £324.; Bombay, 100 cks., £3,182.; Madras, 100 cks., £3,182.

Aniline Dye
Barcelona, 12 pkgs., £279.; Bordeaux, 1 cs., £24.; Cape Town, 1 cs., £6.; Durban, 1 cs., £37.; Launceston, 1 kg., £21.; Ostend, 2 drms., £39.; Rio de Janeiro, 1 cs. (pt.), £17.; Saffi, 1 ck., £20.

Benzol
Copenhagen, 46 drms., £414.

Benzonaphthol
Batoum, 1 cs. (pt.), £20.; Corral, 1 ck., £77.; Porto Allegro, 1 cs. (pt.), £23.; Rio de Janeiro, 2 cs. (pt.), £18.; Rio Grande do Sul, 1 cs. (pt.), £8.

Betanaphthol
Amsterdam (F.), 1 cs., £25.

Carbolic Acid
Beira, 1 ck., £41.; Calcutta, 4 cs., £21.; Kobe, 158 drms., £890.; Singapore, 8 cks., £39.; Sydney, 1 cs., £8.

Cresote
Bordeaux, 20 cks., £82.; Dordrecht, 18,804 gals., £505.; Durban, 10 drms., £9.; Penang, 2 cks., £11.; Rotterdam, 25 cks., £98.; Rouen, 25 cks., £97.

Cresylic Acid
Melbourne, 30 drms., £38.; Sydney, 300 drms., £375.

Mirbane Oil
Auckland, 1 dr., £27.; Lyttleton, 2 drms., £112.

Naphthalene
Bordeaux, 89 pkgs., £256.; Constantinople, 14 cs., £120.; Madras, 6 cs., £27.; Melbourne, 7 cks., £38.; Mombasa, 2 cs., £6.; Napier, 3 cs., £12.; New York, 136 cks., £300.; Paris, 56 cks., £269.

Pitch
Antwerp, 793 t., £2,740.; Brussels, 160 t., £520.

Tar
Durban, 270 drms., £45.; Lagos, 10 rnfts., £19.; Porto Allegro, 20 brls., £38.; Pt. Elizabeth, 63 drms., £9.; Pt. Sudan, 500 drms., £337.

Tar Oil
Buenos Ayres, 250 cks., £449.

COBALT OXIDE—
Melbourne, 1 cs., £48.

COPPER ARSENITE—
Montreal, 1 cs., £14.

COPPER SULPHATE—
Buenos Ayres, 2 t. 2 c., £104.; Constantinople, 8 c., £32.

COPPER SULPHATE & CYANIDE
Barcelona, 3 drms., £96.

CREAM OF TARTAR—
Abo, 6 c., £68.; Bombay, 4 c., £47.; Beira, 1 c. (F.), £10.; Christiania, 10 c., £193.; Cape Town, 1 cs. (pt.), (F.), £8.; Coronel, 1 c. (F.), £13.; Callao, 2 c., £34.; Delagoa Bay, 2 c. GYPNUM—
Wellington, 20 cks., £24.

HYDROBROMIC ACID—
Cape Town, 1 cs., £7.

HYDROCHLORIC ACID—
Colombo, 2 c., £5.; Christchurch, 3 c., £18.

HYDROFLUORIC ACID—
Auckland, 2 cs., £6.

HYDROGEN PEROXIDE—
Antwerp, 3 cks., £25.; Calcutta, 3 cs., £17.; Melbourne, 5 cs., £37.; Pt. Said, 1 cs. (pt.), £16.

HYPHOSPHORIC ACID—
Sydney, 1 cs., £12.

IODINE (RESUBLIMED)—
Amsterdam, 2 cs. (pt.), £23.; East London, 1 cs. (pt.), £6.; Rotterdam, 1 cs., £83.

IODIFORM—
Calcutta, 2 cs. (pt.), £17.

IRON AND AMMONIUM CITRATE—
Buenos Ayres, 1 cs., £5.
Calcutta, 1 cs. (pt.), 1 cs., £23.
Toronto, 1 cs., £130.

IRON AND AMMONIUM OXALATE
Montreal, 1 cs., £30.

IRON PERCHLORIDE—
Brussels, 5 cks. (pt.), £12.

LACTIC ACID—
Antwerp, 7 cks., £94.; Auckland (F.), 1 cs. (pt.), £6.; Iquique, 1 cs. (pt.), £50.; Mollendo, 1 cs. (pt.), £10.

LEAD ACETATE—
Buenos Ayres, 6 brls., £111.; Constantinople, 1 kg., £15.; Paris, 8 cks., £160.; Pt. Sudan, 1 dr., £5.

LEAD ARSENATE—
East London, 1 ck., £11.

LEAD NITRATE—
Montreal, 3 kgs., £20.

MAGNESIA (CALCINED)—
Buenos Ayres, 2 cs., £45.; Bombay, 4 cs., £35.; Callao, 1 cs., £10.

MAGNESIA (CALCINED)—
Corral, 1 cs., £23.

MAGNESIUM CARBONATE—
Constantinople, 3 cs., £33.; Karachi, 1 cs., £6.; Sydney, 10 cs., £30.

MAGNESIUM CITRATE—
Durban, 1 cs., £8.

MAGNESIUM PEROXIDE—
Batoum, 1 cs. (pt.), £9.

MAGNESIUM SULPHATE—
Accra, 10 c., £22.; Canton, 15 c., £28.; Delagoa Bay, 4 c., £8.; Durban, 4 c., £9.; Iddo, 3 c., £7.; Karachi, 10 c., £25.; Lagos, 12 c., £27.; Montreal, 1 t., £21.; Pt. Said, 10 c., £24.; Pt. Sudan, 2 t., £44.; Rio Grande do Sol, 2 c., £6.; Sierra Leone, 1 t. 8 c., £63.; Toronto, 2 t. 12 c., £53.; Zanzibar, 4 c., £8.

MANGANESE HYPOPHOSPHATE
Gothenburg, 1 cs., £20.

MANGANESE RESINATE—
Antwerp, 1 ck., £8.

MERCURY CHLORIDE—
Bilbao, 1 cs. (pt.), £16.

MERCURY PERCHLORIDE—
Pt. Sudan, 52 cs. (pt.), £17.; Rangoon, 1 cs. (pt.), £9.; Toronto, 1 cs., £31.

MERCURY SUBCHLORIDE—
Cape Town, 1 cs. (pt.), £24.; Pt. Sudan, 52 cs. (pt.), £8.

METHYL ACETONE—
Boulogne, 1 dr., £20.

METHYL SALICYLATE—
Durban, 1 cs., £9.; Paris, 4 drms., £20.

MURIATIC ACID—
Rio de Janeiro, 3 c., £32.

NICKEL SALTS—
Brussels, 5 cks. (pt.), £16.

NICKEL SULPHATE—
Brussels, 5 cks. (pt.), £16.; Novorossik, 20 t. 1 c., £1,142.

NITRIC ACID—
Auckland, 4 c., £30.; Christchurch, 3 c., £15.; Colombo, 2 c., £6.; Mollendo, 1 c., £6.; Pt. Swettenham, 1 c., £12.; Rio de Janeiro, 3 c., £55.; Secondee, 1 c., £7.

OXALIC ACID—
Constantinople (F.), 1 ck., £72.; Mollendo, 1 kg., £16.; Rangoon, 1 kg., £29.; Rouen, 6 cks., £39.

PARALDEHYDE—
Auckland (F.), 1 cs., £6.; Christchurch (F.), 1 cs., £8.

PHENIC ACID—
Athens, 2 cs. (pt.), £20.

PHOSPHORIC ACID—
Cape Town, 2 cs., £8.; Christchurch, 15 cs., £127.; Durban, 2 cs., £18.; Perth, 4 cs., £36.

PHOSPHORUS—
Blenheim, 2 cs., £25.; Launceston, 5 cs., £66.; Rangoon, 1 cs. (pt.), £13.

PICRIC ACID—
Pt. Sudan, 1 cs., £6.

PITCH—
Antwerp, 8 c.

PLUMBAGO—
Bilbao, 3 t. 5 c.

POTASSIUM ACETATE—
Calcutta, 4 cs. (pt.), £12.; Singapore, 1 cs., £8.

POTASSIUM BICARBONATE—
Launceston, 1 kg., £11.; Wellington, 1 ck., £10.

POTASSIUM BICHROMATE—
Brussels, 1 ck., £15.; Ostend, 1 ck., £80.

POTASSIUM BROMIDE—
Calcutta, 3 cs. (pt.), £33.

POTASSIUM CARBONATE—
Bombay, 1 cs. (pt.), £9.

POTASSIUM CHLORATE—
Brussels, 4 c., £30.; Christchurch 3 c., £34.; Colombo, 1 c., £9.; Montreal (F.), 10 c., £70.; Pt. Elizabeth, 1 cs. (pt.), £6.; Rangoon, 1 cs., £20.

POTASSIUM CITRATE—
Calcutta, 1 cs. (pt.), £16.
Launceston, 1 cs. (pt.), £5.

POTASSIUM CYANIDE—
Bombay, 1 cs., £15.

POTASSIUM HYPOPHOSPHATE—
Brussels, 1 cs., £7.

POTASSIUM IODIDE—
Amsterdam, 2 cs. (pt.), £150.;
Antwerp, 1 cs., £40.; Calcutta,
1 cs. (pt.), £10.; Demerara,
1 cs. (pt.), £39.; Durban, 1 cs.
(pt.), £77.; Launceston, 1 cs.
(pt.), £6.; Melbourne, 1 cs., £10.

POTASSIUM METABISULPHATE
Paris, 4 cks., £88.

POTASSIUM PERMANGANATE—
Pt. Sudan, 52 cs. (pt.), £5.;
Rangoon, 1 cs. (pt.), £18.; Rio
de Janeiro, 1 cs. (pt.), £14.

POTASSIUM PRUSSIAN—
Christchurch, 1 cs., £11.

POTASSIUM SULPHOGUAIA-
B; Ayres, 1 cs. (pt.), £9. **COLATE**

PRUSSIAN BLUE—
Buenos Ayres, 2 cs., £30.; Rio de
Janeiro, 1 cs., £15.

PYROGALLIC ACID—
Cape Town, 1 cs. (pt.), £11.

QUININE—
Calcutta, 3,770 ozs.

SALTCAKE—
Antwerp, 200 t. 3 c., £724.

SALTPETRE—
Brussels, 4 c., £15.; Cape Town,
4 c., £12.; Lytleton, 1 t., £59.;
Lagos, 3 c., £18.; Montreal,
1 t., £68.; Rio de Janeiro, 3 t.
18 c., £235.; Rotterdam, 3 t.,
£165.; Santos, 4 t. 18 c., £294.;
Secondee, 6 c., £21.; Singapore,
5 c., £21.; Valencia, 1 t., £56.

SHEEP DIP—
Buenos Ayres, 116 t., £3,132.;
Mombasa, 2 t. 19 c., £192.

SILVER NITRATE—
Barcelona, 3 cks., £57.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ...	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barten House, 66, Deansgate.

NEW ARRANGEMENTS.

The "Chemical Trade Journal" will be published in future a day earlier.

SUBSCRIBERS to whom the Journal is posted direct will therefore receive it each week on Friday.

THE TRADE will in future be able to secure their supplies from our London office, 265, Strand, at 10 a.m. on Fridays.

EDITORIAL NOTICES.

INDEX.

Copies of the Index to Volume LXIV. (January-June, 1919) of the "Chemical Trade Journal and Chemical Engineer," which is now available, will be forwarded to those readers who make early application to the Publishers.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than Wednesday morning.

CURRENT TOPICS.

THE NEW PATENTS BILL.

JUDGING by the reception given to the Government's new Patents and Designs Bill, which was read a second time in the House of Commons on Monday, they have been more successful in meeting the needs of industry than they were in their previous attempt to amend the present admittedly imperfect state of the law as regards patents. That was in the autumn of 1917, but the opposition to the measure was so great that it never got beyond the first-reading stage. At the same time, the present Bill must not be regarded as perfect, and it may be that several amendments will be made during the Committee stage which will give effect to at least some of the ideas which exist as to what is necessary if inventors are to be given a fair chance. One point which will need careful consideration is the extension of the life of a patent from 14 to 16 years under Clause 6 of the Bill. We gather from the speech of the Solicitor-General on the occasion of the second reading that this extension is regarded as sufficient to compensate those inventors whose patents could not be worked, for obvious reasons, during the war, but that will not be the general view. Under the Bill all patents, irrespective of the effect of the war upon their working, will receive the benefit of the two years' extension, so that from that point of view alone this does not treat the patentee affected by the war by any means fairly. Again, many patents expired during the war, and during such period of the war in which they were in force they could not be worked. No provision is made in the Bill for these patents, and we cannot help holding the view that as the Government found no difficulty in preventing certain classes of patents being worked during the war, there should equally be no difficulty, quite apart from the

general revision of the patent law of the country, in publishing an order extending the life of these particular patents, after an inquiry in each case, if need be, for a similar period. More will be heard of this during the Committee proceedings.

The Bill alters the present law in two other important respects, to which attention may be drawn. Clause 1, which consists of no fewer than thirteen sub-sections, aims at making effective what the famous Section 27 of the Act of 1907 failed to do—viz., prevent the abuse of monopoly rights, including the adequate working of patents in this country. As we have previously pointed out, this section of the 1907 Act was very adroitly turned to good account by some foreigners, who were able to secure an order of the Court declaring a patent invalid on account of insufficient working, and then imported the patented article themselves. That was never the intention. It was, in fact, the aim of that section to compel foreign owners of British patents to work them in this country, but most people know how that was evaded. Under Clause 1 of the Bill application is to be made to the Comptroller of Patents, alleging that there has been an abuse of the monopoly rights, and the grounds upon which this allegation can be made are set out. Then it rests with the Comptroller, after inquiry, to deal with the patent in one of several ways, and only in the last resort to revoke it. Thus, Clause 1 of the Bill deals much more comprehensively with the whole position than did Section 27 of the Act of 1907, and covers actual abuse of monopoly rights where these are being exercised, in addition to cases in which the patent is not being worked. During the second reading debate the case of boot and shoe machinery was mentioned, from which it appears that a company in this country which controls all patents for this class of machinery refuse to sell machinery, and will only lease it on onerous terms. The law officers of the Crown suggest that Clause 1 deals with such a position, but the industry does not think so, and it is a point which will have to be fought out during the Committee stage. Then under Clause 2 of the Bill a new class of patent is created. These are to be endorsed "Licences of Right" at the request of the patentee, who may ask for this to be done when he finds himself unable to work the patent for want of means. It will then be open to any person to be granted a licence under the patent upon terms which will be settled by the Comptroller if the parties are unable to agree.

Clause 2 of the Bill applies specifically to chemical products and substances intended for food or medicine. It reads as follows:—

"11. (1) After section thirty-eight of the principal Act, the following section shall be inserted:—

"38a (1) In the case of inventions relating to substances prepared or produced by chemical processes or intended for food or medicine, the specification shall not include claims for the substance itself, except when prepared or produced by the special methods or processes of manufacture described and claimed, or by their obvious chemical equivalents. Provided that in an action for infringement of a patent where the invention relates to the production of a new substance, any substance of the same chemical composition and constitution shall, in the absence of proof to the contrary, be deemed to have been produced by the patented process.

"(2) In the case of any patent for an invention intended for or capable of being used for the preparation or production of food or medicine, the Comptroller shall, unless he sees good reason to the contrary, grant to any person applying for the same, a licence limited to the use of the invention for the purposes of the preparation or production of food or medicine, but not otherwise; and in settling the terms of such licence and fixing the amount of royalty or other con-

sideration payable, the Comptroller shall have regard to the desirability of making the food or medicine available to the public at the lowest possible price.

"Any decision of the Comptroller under this subsection shall be subject to appeal to the Court.

"(2) This section shall apply only to patents applied for after the passing of this Act."

Another point upon which criticism will be offered is that no alteration has been made in the form of appeal from decisions of the Comptroller. Many people wish to see a special appeal tribunal set up, consisting at any rate partly of technical men, and not consisting solely of a judge of the High Court.

These may be regarded as the principal provisions of the Bill, although, of course, there are a very large number of detailed amendments and modifications proposed, the purport of which will be better grasped during the discussion in Committee.

ALKALI WORKS INSPECTION.

THE annual report of the Chief Inspector of Alkali, etc., Works (Mr. W. S. Curphey) for 1918 is to hand as we go to press, and only a brief survey is possible this week. The number of works under inspection (including Scotland) was 1,580, as compared with 1,582 in 1917. There was a further increase in the number of processes under inspection, these being, in 1918, 2,352, or 26 more than in the previous year, and an increase of 99 compared with 1916. There were fluctuations in various processes, but the chief increases were in smelting works, arsenic works, and works dealing with residual products from the carbonisation of coal. These increases were, however, counterbalanced materially by decreases in several classes of works, of which the most numerous were associated with the production of materials used for munitions purposes. In three works registrable processes of manufacture were found in operation in unregistered works, but penalties for the contravention of the Act were not enforced. Complaints were received of the alleged emission of noxious gases or vapours from six registered works. In only one or two cases, however, were there real grounds for complaint. On the whole the general average amounts of acid gases escaping were below those of 1917.

LEAD-COATING IRON.

A THIN coating of lead for sheet iron, iron wire and wire gauze seems to promise considerable usefulness. Such coating, as exhibited by Dr. Charles Baskerville to the American Chemical Society, is applied by a process stated to consist in part in dipping the pickled and washed article into a solution of antimony chloride, then placing in a bath of molten lead or antimony lead, and finally withdrawing, and quenching in oil. Lead-coated iron shingles, 10 by 16 inches in size, painted and unpainted, have been exposed to the weather nearly three years without showing rust spots. The shingles can be bent without cracking the coating, and are claimed to be better and cheaper than tin plates. The thin coated plates can be pressed into desired shapes, such as motor-car hubs, which can be nickel-plated and burnished. Lead-coated wire gauze is stated to be equal to the galvanised, and its production is less expensive. The lead coating is unsuitable for some purposes. The rough surface of heavy pipe for water mains is imperfectly coated and further subject to abrasion in screwing the joints together, and, as iron is electropositive to lead, the uncovered parts of iron or steel exposed to water rust more rapidly than the metal unprotected by lead. The thin coating on cast-iron plates, however, is an inexpensive binder for thick layers of lead cast upon it.

HUDDESFIELD TECHNICAL COLLEGE.—The Huddersfield Technical College has been approved by the Council of the Institute of Chemistry as an institution for the training of candidates for the associateship of the Institute.

RECENT DEVELOPMENTS IN THE FERMENTATION INDUSTRIES*

SIR James J. Dobbie, F.R.S. (the Chairman), after calling attention to the great age of fermentation processes, said that the methods employed four or five thousand years ago were not essentially different from those employed to-day.

It was only in quite recent times, mainly owing to the work of Pasteur and his successors, that the chemical and biological factors involved in the processes employed had begun to be understood, and, as yet, only a small portion of the wine and beer produced was manufactured under efficient scientific control. It was more than a thousand years since the alchemists succeeded by means of their alembics in extracting spirit or alcohol in a comparatively dilute form from wine, and the use of alcohol except for medicinal or drinking purposes was quite a recent development. The invention of the Coffey still and similar fractionating apparatus had made possible the production on a commercial scale of alcohol of sufficient concentration to permit of its use for lighting, heating, solvent, and many other important industrial purposes. The yeast industry was naturally closely bound up with the production of alcohol, which, indeed, was in many cases only a by-product of yeast manufacture. During the war the quantity of yeast produced from a given quantity of grain had been doubled without any considerable loss in amount of alcohol produced. Incidentally it might be noticed that the cost of industrial alcohol had been reduced by about one half owing to the concurrent production of yeast. As every chemist knew, ethyl alcohol might be produced from such compounds as ethylene and acetylene or even from its elements; but so far those processes had not proved successful on a manufacturing scale, and the time still seemed far distant when the production of alcohol would cease to be the principal fermentation industry. The manufacture of other important commercial products, such as acetic acid, dependent on fermentation methods, had only quite recently been subjected to control on scientific principles, and the range of the fermentation industries extended as the result of research. Before the war the manufacture of butyl alcohol had excited much interest in connection with the production of artificial rubber, and, under the stimulus of war, the manufacture of acetone became a national concern of the first importance.

Colonel Sir Frederick Nathan then read a paper on

"THE MANUFACTURE OF ACETONE."

Before the war the main sources of acetone were the United States and Austria. Austria ceased to be a source of acetone when war broke out and the United States became the only source of supply. Steps were therefore taken to augment the American output from acetate of lime, and in addition a contract was placed with a firm who adopted a process for making acetone from vinegar, but although the process proved a success up to a point the yield was poor and the price was very high, and it was eventually abandoned. Two other methods of producing acetone formed the subject of much experimental work. Both were catalytic processes; in one alcohol and in the other calcium carbide were the raw materials employed. The former process, suggested by Dr. Perkin, was worked out by Messrs. Joseph Crosfield and Sons, of Warrington; the latter process was the result of experiments conducted at the McGill University of Montreal, and was worked by the Canada Electro Products Co., of Montreal, the calcium carbide being supplied by the Shawinigan Water and Power Co. Acetone was successfully produced by both these firms, but when the requirements of acetic acid for aeronautical purposes became very large it was necessary to stop the process, which was a three-stage one, at the second or acetic acid stage to provide the necessary quantities.

In the spring of 1915 Dr. C. Weizmann, of Manchester University, brought to the notice of the Admiralty his laboratory experiments on the production of acetone by bacterial fermentation from maize or other substances containing starch. Steps were taken to carry out large-scale experiments on the Weizmann process, for which purpose semi-manufacturing scale plant was fitted up at Messrs. J. and W. Nicholson's Distillery at Bromley-at-Bow, and at the same time arrangements were made to carry on research work under Dr. Weizmann at the Lister Institute. The Lister Institute research work and the experiments at Messrs. Nicholson's Distillery, proved that the process, if carried on under proper

conditions, would produce acetone on a manufacturing scale, and it was decided by the Admiralty to erect a plant at the Royal Naval Cordite Factory for the production of acetone by this process. The factory was duly completed and acetone was made very satisfactorily so long as raw materials were available; damaged rice was mainly used. It was also decided by the Ministry of Munitions to adapt some of the spirit distilleries for the process, and three in London and three in Scotland were selected. The distilleries at Bromley-at-Bow and at Ardgowan, near Greenock, were the first to be completed, and the difficulties encountered at the start were being successfully overcome when it became necessary, owing to the shortage of grain, to abandon the manufacture of acetone by this process at the distilleries.

The use of horse chestnuts having been suggested as a source of acetone in view of the fact that they contain a considerable proportion of starch, experiments were carried out at the Lister Institute which indicated the probability of horse chestnuts being suitable for the purpose. It was established that for the successful fermentation of horse chestnuts the following conditions are essential:—(1) The nuts must be of good quality; (2) they should be dried to a moisture content of not less than 1%; (3) they should be ground to as fine a meal as possible; (4) the meal should be as free from husk as possible.

The manufacture of acetone by the Weizmann process attained the greatest success at the factory of British Acetones, Toronto, Ltd., in Canada. The plant started to work in January, 1917, and continued in operation until the signing of the armistice. At the start there were nine fermenting vessels, each of 30,000 gallons capacity; seven more were added in the early part of 1917 and six more in 1918, making 22 in all, and an output of nearly 200 long tons a month was reached.

In the fermentation of maize or other substances containing starch by the Weizmann process, acetone and butyl alcohol are produced in the proportions of approximately one part of acetone to two of butyl alcohol. As butyl alcohol had only a restricted use both for war and industrial purposes, experiments were started by Dr. Weizmann in order to develop a process for converting normal butyl alcohol into methyl-ethyl-ketone which, in the pure state, is equally suitable as acetone for the manufacture of cordite. The process, which was a catalytic one, was worked out on a laboratory scale and promised to give good yields. An experimental plant was erected at Toronto early in 1917, and as a result of the operation of this plant a suitable type of large scale catalyser was evolved. Samples of methyl-ethyl-ketone were made to enable tests to be carried out with it in the manufacture of cordite. The results of these tests being quite satisfactory it was decided to erect a large scale plant at Toronto which, however, only commenced successful operations just before the signing of the armistice.

The results obtained during the war, especially in Canada and the United States, have proved that acetone can be produced successfully on a large manufacturing scale by the fermentation of substances containing starch. The process cannot, however, be considered as a commercial one likely of being capable of competing with the production of acetone by the destructive distillation of wood, because of the relatively high cost of the raw material and the fact that the production of every part of acetone involves the production of two parts of butyl alcohol having very little value for industrial purposes.

Mr. Amos Gill, B.Sc., followed with a paper on—

"THE ACETONE FERMENTATION PROCESS AND ITS TECHNICAL APPLICATIONS."

In this process, said the author, there is still abundant scope for investigation, both academic and practical. From the point of view of academic research, there is yet to be settled the question of exactly what happens during the fermentation. Briefly, the present knowledge is as follows:—When the fermentation begins, gas, consisting of approximately equal volumes of carbon dioxide and hydrogen, is evolved, and the acidity of the mash, as shown by titration against $N/10$ sodium hydroxide solution, begins to rise, until a maximum is reached. At this stage 10 c.c. of the fermenting mash is neutralised by 4.0 to 5.0 c.c. of the alkali. Up to this point no acetone or butyl alcohol is formed, but as the acidity falls the oil content of the mash increases, when fermentation

* Report of conference at the recent annual meeting of the Society of Chemical Industry.

ceases and no further gas is evolved nor any more acetone and butyl alcohol, the acidity is not completely destroyed, the final acidity of the mash being usually in the vicinity of 2.0 c.c. of alkali considerably higher than the initial acidity of the mash.

It is probable that the maximum acidity is produced by a mixture of acids rather than by a single one, because it cannot be completely neutralised by the addition of milk of lime, and the question arises as to whether some interaction takes place between these acids, the proteins, and the starch present. It is not yet clear what part is played by the actual bacteria and what part by the enzymes present. Certainly the reactions are of a complex nature, but if thoroughly investigated the knowledge gained might be of considerable utility in the working of the process. I think the starting point in this work would be the identification of the acids formed during the early part of the fermentation.

Another question which requires investigation is the loss of acetone and butyl alcohol after the completion of the fermentation, if the mash is kept even for a comparatively short time.

From the purely practical point of view the chief field for investigation is the utilisation of the waste products. In a maize mash fermentation there is a solid residue of approximately 13% of the total maize used. This has a very high oil content, since during the fermentation the maize oil is unaltered. The albuminoid content is also fairly high because all the nitrogen present is not used up by the bacilli during fermentation. The carbohydrate content is small—in fact in a successful fermentation the whole of the carbohydrate should be used up. The chief disadvantage here is the cost involved in recovering this residue in the dry state.

Another problem for the technical investigators is the utilisation of the waste gases produced. A small amount of acetone vapour is carried out with the waste gases, particularly when the fermentation is at the vigorous stage and there is considerable "foaming" or "frothing." The amount of gas being approximately 5 cub. ft. per lb. of maize used (or perhaps slightly less), a factory consuming 100 tons of maize per week would produce over a million cubic feet of gas per week. The first suggestion usually offered is to burn the gases under the boilers and so save fuel. Apart from the risk of explosion and the expense incurred in putting up the necessary plant, it was found at the factory in Toronto that the saving would only be about 1%. Another suggestion is to use the waste gases in a gas engine. Here again, for obvious reasons, the engine must be at a long distance from either the fermenting house or the stills, or there would be considerable risk, and if so placed the gas engine could not be used. If the fermentation factory were near a works using large quantities of hydrogen for fat hardening processes some arrangement might be devised whereby the carbon dioxide could be separated, possibly by cooling and compressing, and the hydrogen liberated in a pure state.

Other investigations should be directed at increased yields or economy in working. In this direction some workers favour a continuous fermentation system, and I understand that some time ago an experimental plant was constructed at Toronto, but I have not heard what results were obtained.

Another point is the disposal of the butyl alcohol. There is in existence a process, patented by the Synthetic Products Company, for the conversion of this into synthetic rubber, but they have their own source of supply for butyl alcohol. During the war the butyl alcohol produced (containing about 90% actual butyl alcohol) was in fair demand for patent cookers and as a methylated spirit substitute, but now that this is again on the market this outlet for the butyl alcohol is closed. Research has been done, and plant erected for the conversion of butyl alcohol into methyl ethyl ketone, and has given satisfactory results under the patent of Dr. Weizmann and Mr. D. A. Legg.

The working of this process in this country is always carried out under the disadvantage of the comparatively high price of raw material. In foreign countries the raw material can be grown cheaply and bought on the spot. For example, in India unpolished rice might be used. Again, the experience at Toronto has upheld the belief that it is best to work the process where a continuous supply of fresh grain is available. Considering that the total weight of finished product is not more than 24% of the grain used, it follows that even if costs of running the factory were approximately the same as in this country the saving in freight would be very considerable.

It therefore seems that the future of the Weizmann process lies abroad, rather than at home, although from the pure research point of view much might be attained in the laboratories at home.

Discussion.

Professor Fernbach discussed at some length the discovery of the fermentation process by which acetone and butyl alcohol were obtained from starchy raw material. It was generally accepted both at home and abroad that he first discovered the process in 1910. At the same time he said that certain misleading statements had been made which he felt ought to be put right. In the first instance it appeared that Sir Frederick Nathan had not been informed by Dr. Weizmann that it was in Professor Fernbach's laboratory that Dr. Weizmann had been taught in 1910 and 1911, under strictly confidential conditions, how acetone and butyl alcohol were produced in the fermentation of maize or other substances containing starch in the proportions approximately of one part of acetone to two of butyl alcohol. As early as 1911 fermentations had been successfully carried out on maize, potatoes, and glucose at an experimental factory in this country; and it was therefore misleading to say that the process used by the Synthetic Products Co. had never employed anything but potatoes.

It was true that at the time of his (Professor Fernbach's) work, one process of fermentation was known in which small amounts of acetone were produced, and others in which butyl alcohol was obtained; but no process was known in which acetone and butyl alcohol were obtained simultaneously in one fermentation. He could support Sir Frederick Nathan's view that the Weizmann process and the Fernbach process were generally similar; he would go further and say that from what had been published the processes were identical. They might wonder why the points now mentioned had not been published earlier; but when asked in 1916 to read a paper on the production of acetone by fermentation before the London Section of this Society, he had been formally vetoed by British Government officials; and it would have been an anti-patriotic act for him—a citizen of the French Republic—not to comply with this decision, or to do anything that appeared objectionable to the Government authorities of an allied nation. In Mr. Gill's paper the plant that had been in work at King's Lynn was described at length and finally reported to be an ideal one. Would it not have been simple justice to say what parts of the plant erected by Professor Fernbach's friends had been maintained and what parts had to be altered? The successes of the so-called Weizmann process dated from the time that the King's Lynn factory was taken over by the Government, after having been worked with complete success by the Synthetic Products Co. in so far as fermentation operations were concerned. The failure to produce acetone in any quantity mentioned by Sir Frederick Nathan, had been entirely due to incomplete and inadequate plant for distillation; and immediately this effect was remedied the plant had been worked at its full output with complete success by the staff of the Synthetic Products Co. The reasons for this success, and for those which Mr. Gill reported in his paper, were mainly that the King's Lynn factory possessed a plant which had been specially designed for the working of the process. A works in France had been manufacturing acetone continuously since 1917, and had only recently been stopped through lack of raw material. The fermenting tanks, which had an average capacity of from 16,000 to 18,000 galls., were charged with a mash containing about 8% of maize or rice which was inoculated with a pure culture contained in a two litre flask. The average duration of fermentation had been 40 to 42 hours. Experience had taught in this sort of manufacture exactly what the practice of alcohol manufacture had shown, namely, that the most perfectly erected lines of pipes did not always avoid infection, and that it was best to dispense with the seed tank, and to seed the fermenting tank direct with a pure culture prepared in the laboratory.

Mr. Grant Hooper said he was sure there was nobody in England who denied to Professor Fernbach the credit of having been the first to produce butyl alcohol and acetone by a fermentation process. He expected that Sir Frederick Nathan and Mr. Gill would say that the reason why the process had been referred to as the "Weizmann process" was because Mr. Weizmann had been placed in charge of the production, and they could only speak of the products under his actual operation. He would like to know a little more precisely perhaps as to the exact cost. Could it under the most favourable conditions ever compete with acetone derived from, say, the destructive distillation of wood? It seemed a little difficult to understand also, that it should not have been possible to produce acetone by the acid process at a cheaper rate than had been possible to produce acetone by this process. He gathered that the

residue in this particular process amounted to 13% solid. It was stated that there was practically no carbo-hydrate remaining. No starch remained, but he wondered whether any dextrinous substance was present; he took it that it was not wholly albuminous matter which remained. In any case, all would agree that the products of existence of any organism were fatal to the continued existence of that organism; but here we had apparently an organism which could exist in the presence of such substances as butyl alcohol and acetone.

The Hon. F. R. Henley said he had found it impossible to carry through fermentation with horse chestnut meal unless it was completely freed from husk, and that was in practice impossible. Another material he had used was acorns. He had used fermented quantities up to 2cwt. in the same way as with horse chestnuts; but in that case he believed the tannin interfered with the fermentation, though with a mixture of 40% of acorn and 60% of rice or maize, the issue was fairly normal. One interesting point that had not been touched upon was the course of the chemical reactions which took place during fermentation. In his experience in the factory the acidity rose steadily for the first 12 hours of fermentation, and then fell steadily until a minimum was reached, which was maintained to the end. If that acidity was neutralised as it was formed the salts of two acids were produced—butylic and acetic acid.

Colonel Gooderham said that in Toronto they had started with a 5% mash and had gradually worked it up to at least 10%. They had had their best results at 10%. They had found that the sluggishness of the ferment was due to using it too soon after it had been put aside for future use.

Dr. Reiley, of the Royal Naval Cordite Factory, said that during several fermentations they had attempted to separate the acids which were formed. In the course of their experiments they had found that butylic and acetic acids were not the only acids produced; there was also a small quantity of another organic acid which they did not succeed in identifying. They had found as fermentation proceeded and acidity was formed, that it was mainly butylic and acetic—four parts acetic to one part butylic. After a few hours the proportion of butylic to acetic increased, and the ratio got smaller and smaller until you got a bigger proportion of butylic as against the acetic. Then as fermentation proceeded the proportion of acetic again rose. They had found they got a rising curve of acidity for a certain number of hours and that afterwards it fell off. As it fell off, they added acetic acid to bring it up to the maximum point again. They found they could keep adding acetic acid slowly and that it seemed to be used up. There was a remarkable action going on there; the bacteria or enzymes were actually able to reduce the acetic acidity and in considerable quantities. In fermentation they had found they could increase the percentage of acetone by the addition of acetic acid. If you made acetic acid by an ordinary fermentation process, for example, by souring cheap wines, you could pump that dilute solution directly into your fermentation and get it converted into acetone. In that way you improved your yield of acetone to about 10.5% and got the normal butyl alcohol production. During the war, however, when the production of acetone was important, that might be useful; but he doubted whether in peace time such a process would have an economic value.

Sir Frederick Nathan said he would like to endorse the statement made by Dr. Grant Hooper that they all perfectly well knew that Professor Fernbach was the first to produce a mixture of acetone and butyl alcohol from potatoes. But in the brief sketch he (Sir Frederick Nathan) had put before the conference, he had tried to avoid anything of a controversial nature. He had stated as briefly as he could, certain facts as far as they concerned the production of acetone in this country, and in Canada and the United States during the war. That acetone had been produced by means of bacteria which were given to the department by Dr. Weizmann. It had been used in this country, in Canada and the United States, and was used in every case with some form of grain and not with potatoes.

The chairman proposed a hearty vote of thanks to the authors of the papers, and at the same time assured Professor Fernbach how heartily they all recognised the unique value of the work he had done.

The following paper was then read by Mr. A. Chaston Chapman:

"A PLEA FOR A NATIONAL INSTITUTE OF INDUSTRIAL MICRO-BIOLOGY."

The first, and perhaps the most important, object of the Institute which I have in my mind would be to provide for the

systematic prosecution of original research, in connection with any industry in which micro-organisms or enzymes play an important part. In the next place, the Institute would serve as a centre for the specialised training of men intending to devote themselves to the teaching of micro-biology and bio-chemistry in our Universities and Technical Schools, and also for the practical instruction of factory managers and other technical employees engaged in the various biological industries. A further function which the proposed Institute might fulfil would be that of providing breweries, distilleries, and other factories with any required organisms in pure culture and in sufficiently large quantities for industrial purposes. At the present time scarcely any such facilities exist in this country. In France the want is to some extent met by the *Service des Levures* of the Pasteur Institute. In Germany the work is done by the Institute for Fermentation Industries, and in one or two other countries there are more or less well-known private establishments such as Jørgensen's Laboratory in Copenhagen.

Then again, the Institute would serve to house as complete a collection of industrial micro-organisms in pure culture as could be got together. No such collection exists in Great Britain, and scientific workers, industrialists, and others are compelled to apply to their friends on the chance that someone may happen to have a specimen of the organism required, or to endeavour to obtain it from the Centralstelle für Pilzkulturen in Amsterdam or (before the war) from the Fermentation Institute in Berlin, from Kral of Prague, or from some other foreign public or private institution. Finally—and this would possibly be not one of the least important of its functions—the proposed Institute would serve as a central home for British micro-biological science, and as the Institution to which all workers in this field of natural knowledge in every part of our Dominions would apply for information to which they could send rare specimens for identification or for investigation, and to which they could, subject to proper safeguards in the matter of priority, communicate any discovery of importance. I am well aware of the excellent work in the domain of industrial micro-biology which is being done in a number of isolated institutions such as the Lister Institute in this country, in one or two well-known American colleges, in the Pasteur Institute in Paris, in the Institute for Fermentation Industries in Berlin, in the Carlsberg Laboratory in Copenhagen, and in some others which it is not necessary to enumerate. Each of these institutions, however, deals with this immense subject in certain aspects only, and as compared with the scheme which I am advocating, they suffer from the great disadvantage that there is no co-ordination and that consequently a combined attack on any of the big problems which are calling for solution is rendered very difficult, if not impossible.

Mr. Wm. B. Brierley (of the Institute of Plant Pathology, Rothamsted Experiment Station, Harpenden), said that as a micrologist, he welcomed the opportunity to say one or two words on the proposition that Mr. Chapman had brought before the meeting. Probably Mr. Chapman, as well as others, would remember that at the Newcastle meeting of the British Association, Section K had held a discussion on the organisation and future progress of the science of micrology. To the great disappointment of many, the Government had not taken up the proposition in its fullest aspect; they had acted on it but only to a certain degree. They had created an Imperial Bureau at Kew but had not had the Industrial micrologist in mind. Last November the Pathological Laboratory at Kew had been transferred to the Rothamsted Experimental Station at Harpenden. An institute of micrology had been set up there, and it was proposed to establish a laboratory where pure cultures might be obtained and supplied to those who wanted them. That laboratory was just about to be inaugurated, and he asked help from those who were interested in the pure cultures of micro-organisms. At that laboratory they would have to confine themselves to those organisms which were pathogenic to plants, and more commonly found in agriculture; but they hoped to extend their activities so as to include those micro-organisms which were of use for industrial purposes, and, possibly, finally, to include a good many of those which were pathogenic to man. If such an institute as that suggested by the author was created, biologists would give it the greatest welcome.

Mr. J. J. Lloyd said this was probably the only country of any importance where there was no Bacteriological Society, and he strongly supported the proposal made in the paper. The difficulty of obtaining and retaining pure cultures was far greater than many people thought, and an institution such as that proposed would be of immense value.

RESIDUAL PRODUCTS OF THE GAS INDUSTRY.

IN the report of the Central Executive Board of the National Gas Council, presented at a general meeting of the Council in London last week, appear the following references to matters concerned with residual products:

The Council communicated with Messrs. Chance and Hunt and Messrs. Brothertons, Ltd., with regard to the possibility of increasing the contract prices paid for crude and concentrated ammoniacal liquor. The Council also laid the facts before the High Explosives Department of the Ministry of Munitions, who expressed the opinion that the Council's arguments regarding increased cost of materials and labour constituted a basis for negotiation between producers and contractors for the purchase of crude and concentrated ammoniacal liquor as to revision of prices. A copy of the letter from the Ministry was sent to the District Institutions and Associations by whom the question of prices had been raised.

On November 15 last, the Council were notified officially that gas need no longer be scrubbed to extract benzole for the High Explosives Department of the Ministry of Munitions. In view of the necessity for maintaining the production from home sources of benzole for motor spirit or other purposes, the Board of Trade and the Coal Mines Department were approached on the subject.

The National Benzole Association having been formed for the purpose of marketing as motor spirit the benzole produced by gas undertakings and coke-ovens, the Council were requested to appoint four district representatives to its Executive Committee. The following were accordingly nominated, and have accepted office: Mr. Alex. Wilson (Glasgow), Mr. J. H. Canning (Newport, Mon.), Mr. J. H. Ellis (Plymouth), and Mr. C. S. Shapley (Leeds). The President of the Association is Mr. D. Milne Watson; and Mr. J. H. Ellis has been nominated by the Council to represent the gas industry as a Vice-President.

The Council having been informed that in certain localities there was a slump in the price of spent oxide owing to the importation of pyrites from abroad, the Secretaries of the District Associations and Institutions of Gas Engineers and Managers were asked to furnish particulars of stocks and prices ruling in their districts, in order that these might be laid before the War Cabinet Industrial Transition Committee. When the information had been received, Mr. Napier, of the Scottish Gas Council, and Mr. P. E. Williams, of the London Commercial Gas Company, were asked to appear on the Council's behalf before the War Cabinet Industrial Transition Committee. Mr. Williams thereupon reported on the whole subject; and this report was circulated for suggestion for action to be made by the members of the Executive Committee. The War Cabinet Industrial Transition Committee is apparently no longer in existence, but the Council propose to take further steps to secure better prices for spent oxide supplied by gas undertakings.

A draft scheme for the purchase of tar by distillers from gas undertakings has been agreed upon by the Joint Committee of Tar Producers and Distillers. In December last, a communication (covering a questionnaire) was sent to gas undertakings throughout the country. About 100 replies have been received, indicating that the scheme appeared to be a suitable one for adoption by the undertaking. An agreement has now been drawn up by counsel; and this will shortly receive the further attention of the Joint Committee.

ESTIMATION OF NITROGEN.

ONE of the drawbacks of the highly accurate Dumas' method is the length of time occupied in cooling the tube between one estimation and the next. L. Dexheimer (*Zeitsch. anal. Chem.*, 1919, 58, 13-19) has devised a method of continuous operation which avoids this necessity, and enables 15-20 estimations of nitrogen to be carried out in a day. After the end of the first combustion the current of carbon dioxide is sent through the tube in the reverse direction, and the flame under the hinder portion of the tube is extinguished as far as the granulated cupric oxide. The latter and the copper spiral are heated continuously during a series of estimations. The reversal of the carbon-dioxide current prevents the access of air during the operation of withdrawing the combustion boat and the plug of copper oxide at the hinder end and the substitution of a fresh boat and fresh

plug of copper oxide, which are kept ready. In order to prevent the immediate volatilisation of the new substance the combustion tube should project 15-20 cm. beyond the furnace at this end, and this portion of the tube is always cold. When the boat has been inserted in this portion and the stopper of the tube replaced, the current of carbon-dioxide is again passed in the forward direction and a fresh nitrometer is fitted to the apparatus. The absence of air is next confirmed by means of this nitrometer, and as soon as this is indicated, the boat is pushed forward into the combustion zone. After two or three estimations it becomes necessary to regenerate the copper oxide by passing a current of oxygen through the tube in the reverse direction, and this is so arranged that it is introduced through a capillary tube which passes through the copper spiral so that the latter is not oxidised. The passage of oxygen is performed at the same time as the current of carbon dioxide is reversed, and the excess of oxygen is subsequently swept out by the carbon dioxide. The manipulation of the boat is effected by a wire with a loop at the end which is passed through the stopper of the combustion tube and is lubricated with glycerol.—*Analyst*.

ELECTRO-CHEMICAL INDUSTRIES OF NORWAY.

A CORRESPONDENT of the *Financier*, writing from Christiania on recent developments in the Norwegian electro-chemical industries, states that during the war large sums were put up for the erection of new plant and machinery, mostly at an excessive cost, but for the time being huge profits were made. The question that is exercising the minds of people now is the extent to which these industries will be able to maintain an output commensurate with the power available and the capital employed when markets resume a more normal condition. Generally, the opinion obtains that, whilst the future is promising, an anxious time will be experienced during the next year or two, and that many factories will have to close down wholly or partially until existing supplies are diminished and absorbed. To the extent to which some industries are dependent upon the importation of raw materials the outlook is more dubious. So far as raw materials can be obtained in Norway, however, the position is more promising, and in the manufacture of such articles as ammonium, calcium and sodium nitrates there is little to fear beyond the uncertainty of the labour position. The whole problem would be easier if more experience of pre-war conditions had been gained, but so many products are entirely the result of abnormal war activity that those concerned with the management are filled with anxiety as to the future.

Large factories have been built for the manufacture of concentrated sulphuric acid, whilst alumina sulphate has been produced for the first time in Norway. The making of electrodes is a new industry. A process has been elaborated during the war in Norway, and has proved a great success, so much so that manufacture is now being undertaken in several parts of the world. This results from the complete carbonisation of a combination of anthracite, pitch, and other similar materials. It has been found possible to obtain 99 per cent. of pure carbon content at quite a reasonable cost, and the product possesses quite a long life. By this process the electrodes are produced by the factories for their own use, and no outside labour is employed. In ferro-alloys a lot has been done during the war with ferro-chrome, ferro-manganese, and ferro-silicates, whilst another war development is the production of molybdenum, but that is not entirely treated in Norway, and is exported in the form of a concentrate. As already stated, so far as these industries are self-contained, it is believed that, with the use of electric power, they will, apart from labour troubles, be in a favourable competitive position for some years to come, but considerable anxiety exists regarding those that are dependent upon imported raw materials, and a policy of marking time has been adopted.

ZINC AND ZINC DUST PRICES.—Australian high-grade zinc dust (88/92 per cent. metallic zinc purity) is quoted at £70. per ton f.o.r. Substantial sales have taken place during the past week, and it is understood that period contracts have been entered into at a reduced price. The price of Australian electrolytic zinc, containing 99.95 per cent. metallic zinc, is unchanged at £42. per ton f.o.b. Australia for direct shipment to New Zealand, India, South Africa, and the Far East.

CHROME TANNING INDUSTRY.

A Conference on the Chrome Tanning Industry took place at the annual meeting of the Society of Chemical Industry, in collaboration with the United Tanners Federation and the Federation of Curriers, Light Leather Tanners and Dressers.

Dr. Chas. Keane, in introducing Mr. Francis H. Briggs, President of the Federation of Curriers, Light Leather Tanners and Dressers, expressed the appreciation of the Society of Chemical Industry, which was a society of chemists only, at being brought into touch with those who were connected with special industries which had relation to chemistry.

Mr. Briggs then took the chair. The subject to be discussed, he said, had been very much neglected, yet from the national standpoint the subject of chrome tanning was one of profound interest, because we controlled the greater portion of raw material. In India alone, the total of hides was in the neighbourhood of 12 millions, but whilst the largest proportion of that, some 20 years ago, was dealt with in this country mostly by vegetable tanning, in the year 1913, 80 per cent of these hides were dealt with by the Central Powers, and made mostly into chrome leather; a very large proportion of which found its way back to London. The same position existed in regard to Indian goat skins which were tanned, dressed, and made into glacé kid. That was a very sad state of affairs, and he could not help thinking that a great deal of it was due to the world of science. Austrians, Germans, and especially the Americans, had fostered the process of tanning to such an extent that they had left us high and dry to look on and regret that we had been so slow in pushing forward with the raw materials which we controlled.

Professor D. McCandlish read a paper on—

"THE DEVELOPMENT OF THE CHROME TANNING INDUSTRY IN THE UNITED STATES."

As the United States has been so closely associated with the chrome tanning industry since its inception, it seems appropriate that special consideration be given to the part taken by that country in originating and developing what is comparatively a new method of tanning. The commercial employment of chromium compounds as tanning materials in America commenced about 1884, when Augustus Schultz of New York was granted a United States patent for what he described as "An improved process for the tanning of hides and skins." In this method of tanning, the skin is impregnated with chromic acid, which is readily absorbed by the skin fibres in the first bath. The chromic acid is subsequently reduced in a second bath to a basic chromium salt, which is the actual tanning agent. A mixture of sodium or potassium bichromate with hydrochloric or sulphuric acid is used for the first bath, and a mixture of sodium thiosulphate with either of these acids constitutes the second or reducing bath.

Several years before Schultz patented his method, Professor Knapp in Germany had described a process for making chrome leather by the use of basic chromium chloride solution, made by dissolving precipitated chromic hydroxide in hydrochloric acid and rendering the solution basic with sodium carbonate. Martin Dennis, of Newark, N.J., evidently became aware of the possibilities of this method, and in 1893 was granted a patent for a basic chrome tanning liquor which closely resembled Knapp's basic solution. By means of such a liquor, properly prepared hides and skins may be converted into very satisfactory leather, and as the tanning is completed in one solution, this system is known as the "one-bath," as distinct from Schultz's "two-bath" process. Although the ultimate tanning agent in both processes is the same, i.e., a basic chromium salt, there is one essential difference between the methods. In the two-bath process finely-divided sulphur, liberated from the thiosulphate-acid solution in the second bath, is deposited in and upon the fibres of the leather, giving a certain characteristic softness not readily obtained by the one-bath tannage.

The processes described form the foundation upon which the chrome tanning industry of the United States has been built. Whilst the advantages and disadvantages of chrome and vegetable tanned leathers have been the subject of many controversies, the fact remains that so far as upper leather is concerned, the former has largely supplanted the latter during the past twenty years in the United States as well as in this country.

The actual tanning processes have been greatly improved. In the one-bath system a better understanding of the necessary relationship between the basicity of the liquor and the condition of the raw pelt has helped to do away with a great deal of the uncertainty which existed in the earlier days.

The fat-liquoring of leather was formerly carried out with emulsions of animal and vegetable oils in soap solution. Mineral oils have been looked upon with disfavour not only because they were used as adulterants of the more expensive oils mentioned, but because they did not give satisfactory emulsions with soap solution. A development which may have far-reaching effect is the utilisation of mineral oils for fat-liquoring purposes in conjunction with sulphonated animal, vegetable, or fish oils, which are excellent emulsifying media and possess lubricating properties themselves.

A noteworthy addition to the mordants available for use upon chrome leather previous to dyeing with aniline colours was made a few years ago. An extract prepared from osage orange wood, introduced under the name of Aurantine, has found successful application as a substitute for fustic extract. The yellow colouring matter of the extract is readily absorbed by chrome leather and this preparation will probably be more extensively used when it is better known.

In the finishing operations considerable ingenuity has been exercised in devising means of overcoming defects in the skins and improving the appearance of the leather. A process for finishing coloured chrome leather which fairly effectively covers irregularities arising from uneven colour absorption in the dyebath, and tends to give a desirable even appearance, employs what are known as pigment finishes. These consist of finely ground earth colours suspended in suitable gum or resin solutions, and can be applied in the same way as ordinary finishes. If the skin defects are very prominent, it may be necessary to buff the grain lightly on an emery or carborundum wheel to obtain an even bottom on which to apply the finish. The finishes are so constituted, and have such good covering property, that it is not always easy to decide without the aid of a microscope if the grain has actually been buffed.

Mr. M. C. Lamb followed with a paper dealing with:

"THE CHROME TANNING INDUSTRY IN GREAT BRITAIN."

The first attempt at the conversion of prepared hide into leather by a process of mineral tanning is generally credited to Professor F. L. Knapp, who obtained patent rights for the use of normal or basic salts of chromium iron, manganese, etc., in combination with fatty acids for the purpose. The patent of Christian Heinzerling of 1878 was the first process of mineral-tanning to be applied on a commercial scale. Heinzerling's method consisted of the application of a mixture of potash alum and potassium bichromate and the subsequent treatment of the hide with albuminous matter such as blood. During the period when the Eglinton Chrome Tannery Co. were endeavouring to pioneer this process, Professor J. J. Hummel, of the Yorkshire College, Leeds, was consulted with a view to devising a process for fixing the chrome salt on the fibre. After some experimenting, he suggested a method then used in the chrome-mordanting of wool and cotton, of applying chromic acid to the prepared hide and subsequently reducing this by treatment with sodium bisulphite or thiosulphate. Samples of leather were actually produced by this process, but for some reason, unknown to the author, the method was not worked on a commercial scale, though it anticipated the method patented by Augustus Schultz in America in 1884.

In 1893, Martin Dennis took out patent rights in America for the use of a basic chromium chloride solution for tanning. The Martin Dennis process as regards the preparation of the chrome tanning liquor is very similar to that originally advocated by Knapp. This process was the commercial pioneer of the now common method of chrome tanning by what is termed the "single-bath" process, depending upon the utilisation of a basic chromium sulphate or a basic chromium chloride solution.

The methods of Schultz and Martin Dennis were brought to the notice of the British leather trade by Professor H. R. Procter.

The progress of the application of the "single-bath" method of chrome tanning became more rapid after the publications of Procter in 1897 and 1898, in which he advocated, in the first place, the reduction of an acidified solution of potassium bichromate by organic reducing agents, e.g., glucose, sugar, etc., following on somewhat similar lines to the method described by Hummel in the account of chromium mordants in his book entitled "The Dyeing of Textile Fabrics," published in 1886; and a still more simple method of making a basic chrome liquor by the addition of an alkaline carbonate to a solution of chrome alum. This salt, which was obtainable in large quantities as a by-product in the manufacture of alizarine from anthracene, having very little

commercial application, was available at a very low price. The liquor was more simply prepared than that patented by Martin Dennis and was more uniform than that obtained by the reduction of chromic acid with organic reducing agents. In consequence, this method of preparing chrome liquors was almost universally adopted and continued to be used up to 1914, when owing to difficulties in obtaining chrome alum, tanners had of necessity to revert to the manufacture of chrome liquors by the reduction of chromic acid by reducing agents, glucose, farina and starch being employed until the use of these materials was prohibited, when sodium bisulphite, sodium thiosulphate, and sulphurous acid were pressed into service.

A few special points of importance showing the progress that has been made in the manufacture of chrome leather in Great Britain may be mentioned.

It was found that, in the original formula of Schultz, consisting of 5% of potassium bichromate and 2½% commercial hydrochloric acid, only about two-thirds of the total quantity of bichromate is converted into chromic acid, and the unconverted bichromate is not absorbed and subsequently reduced. Considerable economy was effected by the use of a sufficient amount of acid in the first bath to effect the almost complete conversion of the bichromate into chromic acid. The quantity of thiosulphate (10%) and hydrochloric acid (5%) recommended by Schultz was found to be insufficient, and the quantities were materially increased.

Whereas it was customary a few years ago to use a fresh solution of thiosulphate and acid for each pack of goods, it is now more general to use a standing bath; this has resulted in considerable economy and it is generally conceded that the finished leather is improved.

During the past few years great attention has been drawn to the importance of the degree of basicity of the chrome liquor, when processing goods by the single-bath method and to the necessity for adjustment of this for the particular class of goods being processed.

Discussion.

The Chairman said the trade was now beginning to do what it ought to have done 10, 15 or 20 years ago. Firms were now spending £5,000 per annum in research work and there was a great opening for chemists in consequence. The paper proved conclusively that the scientific man had not been sufficiently recognised by the trade in England. He hoped, however, that scientific men would now recognise that the tanners were out for the best, and that best could only be obtained by co-ordination. The question of combining on a large scale was a question for the various firms concerned.

Mr. Richardson asked whether it was possible for a steady, quiet business man here in a moderately large way to compete with the large American tanners.

Professor McCandlish said it was rather a wide question, and his opinion must be considered to be that of one man only. Possibly a word as to the development of the large American tanners might be interesting. One particular firm was started by a practical working German tanner, who started with a few skins which he dressed himself. In the course of 20 or 30 years that business developed into a tannery turning out 5,000 skins per working day. The firm was now spending £10,000 a year on research. He did not feel in a position to answer the question put by Mr. Richardson, although the chances were that the small English tanners could compete. The chrome leather and glacé kid produced here were equal in quality to American, and why they were not produced in a larger quantity was a question for the tanner to answer and not the chemist.

Mr. F. Innes thought the whole question came back to education. If the tanners of to-day had been taught science at school there would have been more hope of chemists getting earlier into the trade. He had known of firms here where the chemists had had considerable difficulty in getting the confidence of the firm which employed them and who found that alterations in processes were made without their knowledge. That was altogether wrong in principle.

Professor McCandlish said that on the whole American tanners were making more use of chemists than English tanners. At the same time a chemist must have a good working knowledge of tannery conditions before he could be regarded as competent to guide the chemical necessities of a tannery.

Mr. Challis spoke of the difficulty there had been in obtaining chromium chemicals during the war, and asked if that difficulty still existed. A little before the war there had been difficulty in getting sodium chromate. He also referred to a new process called "Pyrotan." The description he had seen

spoke of baths of alum and other salts being used, and he asked if anybody could say whether this process was likely to beat chrome tanning in the future.

Mr. Richardson said he had found Pyrotan leather unsatisfactory.

The Chairman said that Pyrotan leather was more or less in its infancy.

Mr. Woodruff said that what he believed was lacking in the tanning industry was that there were no process chemists, and until we could get some process chemists, or some tanners in the trade who could tan and also understand the language of the chemist, we should not make progress.

Mr. Sage proposed a vote of thanks to the authors of the papers.

Professor McCandlish replying, said he knew some of the difficulties encountered by the chemist in a tannery. One essential thing was to obtain the goodwill of the foremen and workpeople. The tanning industry had been conducted on certain lines for centuries and anybody who proposed to vary the old rules was looked upon with suspicion. One point that had not been touched on was the question of a tariff. He had omitted all reference to it in his remarks, but the American chrome tanning industry had been built up behind a tariff which had remained in force for a great number of years, and only in recent years had been taken off. He had been in America at the time when chrome leather was put on the free list. The removal of the tariff had adversely affected the American industry and the German leather was coming in in large quantities. The English tanner had had a real difficulty in having to compete with the cheap labour of Germany on the one hand, and the highly organised production of America on the other. These had been severe difficulties to face in an open market.

Mr. Lamb also briefly replied.

NIGERIAN INDIGO.

THE native indigo plant of West Africa, *Lonchocarpus cyanescens*, yields under suitable conditions the same blue dye, indigotin, as the ordinary indigo plant (*Indigofera*) and is largely used by the natives in dyeing. In Abeokuta, in the Southern Provinces of Nigeria, there are plantations of the plant extending to several hundred acres; but, as a rule, the leaves and young shoots are collected from wild plants, which are, however, commonly preserved by clearing away the surrounding scrub. In its natural state the plant is a climber, reaching a height of 30ft.; but under cultivation it becomes a bush 7 or 8ft. high, owing to the regular cutting.

Specimens of the dried plant from Sierra Leone and the Southern Provinces, Nigeria, examined at the Imperial Institute some years ago, were found to yield 0.65 per cent. of indigotin, whilst a sample of lump indigo prepared from the plant by natives of Kontagora, Northern Provinces, Nigeria, gave only a low yield of indigotin, viz., 21.5 per cent., as compared with 60 per cent. in good commercial Bengal indigo derived from *Indigofera*. A further specimen of indigo from Nigeria examined in 1917, the botanical source of which was not stated, was also of rather low grade, containing 27.5 per cent. of indigotin; but in this case the yield was reduced owing to the presence of a large amount of mineral matter in the sample.

In order to determine the yield and quality of indigo which *L. cyanescens* will furnish, a series of experiments was conducted recently in the Southern Provinces, Nigeria, and ten samples of indigo were forwarded to the Imperial Institute for examination last year. The results of this investigation, according to the *Bulletin* of the Institute, indicate that indigo of good quality containing up to 56 per cent. of indigotin can be prepared from the fresh leaves of *Lonchocarpus cyanescens*. The indigo of best quality was obtained by the use of the usual method employed in India, but the yield was much less than that obtained in India from green plants of *Indigofera* spp.

INSTITUTE OF CHEMISTRY: PASS LIST.—In the July Examinations for the Associateship of the Institute (A.I.C.), held recently, one candidate passed in branch (a), mineral chemistry, Lieut. Cecil William Wood, King's College, London; two candidates passed in branch (d), organic chemistry, Lewis Guy Peirson, B.A. (Cantab.), and John Edwin Pollock, B.Sc. (Lond.), University College, Reading; and one candidate in branch (g), chemical technology, with textile chemistry as special subject, Percy Edward Stanhope, Royal Technical Institute, Salford.

THE NITRATE POSITION.

THE world-war having practically come to an end in November last on the signature of the armistice, hopes were entertained that supplies of nitrate of soda from Chili might reach Europe in time for the agricultural season of 1919. Not until May 15, however, was the article released from Government control, and so small were the available stocks that the most optimistic trade estimate of the consumption, including that for chemical purposes, in the United Kingdom in the past six months is under 20,000 tons. This figure compares with 80,610 tons in the corresponding period in 1914, and shows that the British farmer paid little attention to the Board of Agriculture's tempting offer of the Chilean fertiliser at £20. per ton, which, by the way, was soon withdrawn at the instigation of the Ministry of Munitions, able to dispose of its surplus stock at higher prices to Continental buyers. Large transshipments were so made to Holland, Belgium, Denmark, and Spain, but as nitrate was "a closed book," and the Government are not at all likely to have published particulars, we hesitate to follow the more or less guess-work current estimates. The European total of "about" 450,000 tons, comparing with 1,495,860 tons in the first half of 1914, is considered "quite satisfactory," and the quota allowed to Holland, 115,000 tons, is certainly imposing, considering that out of 88,600 tons delivered in the pre-war period from Rotterdam a large part was sent to Germany, now out of the running. At all events, there is little risk in agreeing that France and Belgium, which then accounted for 544,000 tons, "would last season have taken more than 237,000 tons if their richest agricultural regions had not been ravaged by war, if larger supplies had been available, and if exorbitant prices had not been asked by the Government agents." The following are the official statistics relating to the industry in Chili:—

	1919. Tons.	1918. Tons.	Inc. or Dec. Tons.
Production six months to June 30 ..	900,000	1,438,000	- 538,000
Shipments:—			
To Europe (including Egypt	58,000	522,000	- 464,000
.. United States and other destinations	181,000	816,000	- 635,000
Total Shipments	239,000	1,338,000	- 1,099,000
Stocks in Chili, June 30	1,488,760	990,000	+ 498,760

Through the closure of oficinas, crowded with nitrate and unable to market their stocks, the output steadily diminished from January onwards, until in June it reached only 128,000 tons, or about half the normal monthly total. The decrease on the half-year was consequently half a million tons compared with the corresponding period in 1918; and while some of the more favourably placed companies with extensive "canchas," or drying-floors, will no doubt continue to produce nitrate, the majority are by *force majeure* compelled to cease operations. This is the more to be regretted as the cost of production has considerably fallen, through the depreciation of the Chilean currency in which wages are paid and the lessened competition for labour. Bags, fuel, and all imported articles are still dear, but, on the other hand, the export duty has, with the aforesaid fall in exchange, returned to a normal level. The cost of production varies according to the grade of the raw material available, and it is therefore difficult to fix an "average," but it may safely enough be placed at under 7s. per quintal, f.o.b., excluding those oficinas able to live only on fancy prices. It is generally admitted that the cost can be reduced through improvements in the mode of extraction, leaving less nitrate in the *ripio*, or sludge; but inasmuch as the best scientific brains have been occupied over the matter during the past quarter of a century, recent claims in that direction may be accepted *cum grano salis*.

The great decrease in shipments from Chili, although synchronising with a material falling-off in production, has resulted in an enormous accumulation of stocks, now exceeding 1,500,000 tons, and, unfortunately, there is no prospect of an early removal of the incubus. If the war had lasted until now the necessary tonnage would have been provided by the Allies in order to meet their urgent requirements of munitions. In ordinary times the nitrate wanted in Europe and elsewhere for agricultural purposes would have been sold on the West Coast and shipped to the different destinations at moderate freights. At the present moment the required shipping is unavailable, except for a few neutral boats asking exorbitant rates, and the nitrate producers, through no fault of their own, are landed in a blind alley. The Shipping Con-

troller has just informed a deputation that, much to his regret, he will be unable to allow British vessels to go to Chili for some months to come, as these are wanted to load foodstuffs in other parts of the world. A certain number of the French ships regularly employed as nitrate carriers before the war may be available, although many were victims of the submarines; while several of the German sailing vessels and steamers laid up in Valparaiso were lost in the great storm at that port a couple of weeks ago. It will therefore be seen that, although a few hundreds of thousands of tons may be shipped this year to Europe and the United States (to the latter in American bottoms), the bulk of the present stocks of nitrate in Chili, plus the balance of the 1919 output, will remain stranded there until next year.

To complicate an already sufficiently confused situation comes the formation of the so-called "Nitrate Producers' Association," particulars of which have been given in these columns. Alarmed at the prospect of a falling market, the majority of the producers, representing about 73 per cent. of the total output capacity, determined in January last to "centralise" sales at "fixed prices," instead of allowing individual transactions as in all previous "combinations," merely restricting the output. This step, long advocated in some quarters, but never carried out, was ostensibly taken in order to counteract the not unnatural intention of the Chilean Government henceforth to have a voice in the control of the industry, officially considered to have lapsed into a condition detrimental to the national interests. These producers, however, reckoned without their host. Having fixed their prices at the inordinately high level of 10s. 1d. per quintal, f.o.b., for ordinary nitrate, and 10s. 4d. for "refined," they discovered to their dismay that they were being undersold by the Government dealing with the production of the native Antofagasta and Union Companies, and the powerful German oficinas remaining outside the ring. Exact particulars of the transactions are not yet available, but their importance can be gauged from the semi-official mention of 900,000 tons to France, 100,000 tons to Italy, 50,000 tons to Holland, and 20,000 tons to Spain. The consequence is that the association, whose members have not sold a ton of nitrate since November, is completely shut out of the market! It is therefore hardly surprising that the associated producers are already regretting the new regime, not a voice being raised in its favour at the recent meetings of nitrate companies held in London, and its early demise may safely be expected, in the absence of a *modus vivendi* with the Chilean Government. The latter's intervention is variously described as incomprehensible, inconsistent, and disastrous, but inasmuch as the industry is the corner-stone of the national finances, the official steps taken for the removal of the deadlock can readily be understood. The loss in revenue from the export duty alone was nearly three millions sterling in the six months compared with the corresponding period last year, and its continuance would seriously imperil the solvency of the State. Judging from the experience at home, we are by no means enamoured of Government interference with trade, but in the present case the insinuations in the Press seem far-fetched—that the main object is to provide political protégés with "soft jobs." The sale of nitrate at prices considerably below those "fixed" by the Association, however distasteful to the latter, is, at all events, not a heinous offence to the consumer, the leading performer in the piece.

Before the war the major part of the exports of the Chilean fertiliser passed through the hands of the big German houses—Weber, Vorwerk, Gildemeister, of Hamburg, Bremen, and Valparaiso,—the British share of the business being comparatively small. It remains to be seen to what extent those firms will be able to resume their activities; and meantime the Allied and neutral merchants should have an excellent opportunity of extending their operations, when tonnage becomes available. At present, however, they and the large dealers are up in arms at the system of "fixed prices," relegating them to the position of mere commission agents, precluding chances of profit, and thus removing all incentive to "forward" purchases. The interests of company agents and directors, themselves nitrate merchants, are also threatened, and there is a general cry for "a free market," even at the risk (*sic*) of a temporary collapse in values. The withdrawal of the obnoxious condition may therefore be expected at an early date, since it is a *sine qua non* to the revival of the trade; yet it is to be feared that even the removal of this principal plank in the Association's platform will have little immediate effect. After comparing notes, and as a result of abstruse calculations, the leading statisticians have come to the conclusion that the world's requirements of Chilean nitrate of soda—excluding Germany and Austria, formerly the largest

consumers—are likely to reach two million tons in the year ending June 30, 1920. That the demand would be heavy if abundant supplies were available at moderate prices goes without saying, but, unfortunately, both those indispensable conditions are absent, the dearth of tonnage preventing the shipment of anything like the above total within the period named, and excessive freights raising the c.i.f. value of nitrate to a prohibitive level for agricultural purposes. It is said that 130s. per ton has recently been paid for steamers to the United Kingdom, and 200s. to the Continent, compared with about 25s. before the war.

The next manurial season in Europe is so distant that there is no occasion to indulge in predictions beyond the safe one that nitrate of soda will be dear for some time to come. Fortunately, the British farmer has got on very comfortably with sulphate of ammonia; likewise Germany with the synthetic product, an exceptionally fine harvest being expected there. Germany has by the way, undertaken under the Peace Treaty to supply France with 30,000 tons per annum for three years—sufficient proof in itself of the "atmospheric nitrogen" competition of which the Chilean nitrate producers will have to run the gauntlet. Every civilised country is now busy tapping the boundless nitrogenous sources in the air, and the annual output of these substitutes for natural nitrate of soda, already running into formidable figures, will rapidly expand. The latter's present parlous position will no doubt improve with the eventual increase of tonnage available for exports, but high authorities in the trade are of opinion that it will not return to normal conditions before 1921. In the meantime, the producers, instead of earning big profits like a year ago, are carrying heavy stocks at high rates of interest, and in many cases incurring stoppage expenses. As it never rains but it pours, the extremely profitable sales of iodine to the Allies for the treatment of the wounded have practically ceased since the signature of the armistice. On the prospective reduction or disappearance of dividends, nitrate shares have, as we expected, suffered a severe fall, and those of our readers who happen to hold these cannot complain of not having been warned against the risk.

NEWS FROM THE ANTIPODES.

[FROM OUR OWN CORRESPONDENT.]

SYDNEY, June 9.

Wages in the Soap Industry.—Fresh claims have been submitted by the Factory Employees' Union in connection with the soap and candle industry. It is requested that the hours of labour shall be 44 per week, except in cases of night work. The rate of wages includes: Working foreman on any shifts in glycerine room, £5.; man alone, or with only one assistant, in glycerine room, £4. 15s.; all other labour in glycerine department, not classified, £4. 10s.; yardsmen and warehousemen, £4. 7s. 6d.; man in charge of soapmaking, £5. 10s.; assistant soapmaker, £5. 5s.; soap mixer and boiler, £4. 5s.

Castor Oil.—In addition to the castor oil made in the Commonwealth from imported beans, Australia and New Zealand import 500,000 gallons annually from India. And this expensive importation, it is claimed, is quite unnecessary, for, according to Mr. Pye, Director of the Dookie Agricultural College, Australia could supply her own needs as to this commodity. In the course of his report on the subject to the Institute of Science, Mr. Pye states that undoubtedly in Queensland and in the warm parts of other States the production of castor beans would be excellent. He recommends that a small area of one of the northern irrigation settlements be devoted to the production of castor beans, for, judging by his experience in the north, he is of the opinion that complete success would be met with.

By-products From Wood.—Giving evidence before the Industries Committee at Palmerston North, New Zealand, as to the value of by-products obtained from wood, Mr. J. A. Nash stated that from one cord of rata wood £56. worth of acid, 16s. worth of oil, 15s. worth of tar, and £10. worth of charcoal could be obtained. He said any wood could be used, and even sawdust. A company was being formed to carry on the work here. Captain Proove stated that dyes could be obtained from native woods, and had been used by Maoris for dyeing flax mats. He suggested scientific investigation by the Government. Mr. J. M. Johnston suggested that the Gov-

ernment should make experiments with English hemp in suitable districts, and advocated a geological survey of the Dominion to locate coal and minerals in payable quantities. Mr. M. A. Elliott urged the Government to assist in producing by-products from wool scouring.

Dye Imports.—The importation into Australia of dyes of other than British origin was prohibited by Proclamation of February 25 last. The Commonwealth Government state that permission will be given for the importation of foreign dyes in cases where the Commissioner for Dyes, Board of Trade, certifies that the same dye of British manufacture or an effective British substitute is non-existent or produced to an inadequate extent, but the quantity admitted under this concession is not to exceed six-months supply. It is also explained that for the purposes of the Commonwealth Proclamation, "British" means produced or manufactured in a finished state in some part of the British Empire and thence shipped to Australia.

Market.—Caustic soda, English brands, is becoming very scarce. For 76 per cent. holders are asking £35., and for 72 per cent. £32. American is obtainable at about £28. in distributing lots. G grade rosin, in wholesale parcels, is quoted at from £30. to £30. 10s., and N grade at from £34. to £34. 10s. net. Distributing rates are somewhat higher. A small lot of soda ash has changed hands at £15., but it is stated that this is somewhat above the market. Japanese carbide sells at from 38s. to 40s. a drum. Regarding chemicals generally importers emphasise that present prices in Sydney are, and have been for some time, below indent equivalents. Trading has been done from stocks in hand, and when these are exhausted different prices must rule. Some of the wholesale quotations for various lines are interesting. Citric acid is quoted for large parcels at 3s. 7½d., English make, while Italian is cheaper. Cream of tartar, English, is quoted at 3s. 3d., while Italian has sold as low as 2s. 9d. These prices are below indent equivalents, as the c.i.f. and e. prices quoted from abroad are—for citric acid 4s. 7d., and for tartaric 3s. 4d. Sales of silicate of soda between houses have been made at £28. Other quotations are:—Alum: Japanese, £30.; English, £33. per ton. Arsenic: White, £70.; grey, £65. per ton. Bluestone: Macclesfield's, £54.; Japanese, £44. net per ton. Boracic acid, £90. per ton. Borax: Powdered or lump, £60. per ton. Carbon bisulphide: Colonial, 10d. per lb. Carbolic acid: English, 98 per cent., 9s.; colonial, 9s. per gallon. Cyanide, 98 per cent., 1s. 7d. per lb. Quicksilver, 7s. per lb. Soda: Bicarbonate, in kegs, £18.; soda crystals, £10. Sulphur: American flowers, £36.; Japanese, common, £18. per ton. Oxalic acid, 2s. 9d. per lb. Chloride of calcium, £20. per ton. Whiting, English, £19. per ton. Oils and paint materials prove slow of sale, the prolonged spell of wet weather having affected business. Linseed oil is quieter on the basis of 8s. 4d. per gallon for raw. American white lead is offered at from £68. per ton, and Australian at from £67., according to quantity. Stocks of British white lead are reported small at £86. basis. Turpentine steady at about 5s. 8d. per gallon. Vegetable and Eastern seed oils dull. Japanese cottonseed oil offered at 8s., rapeseed oil at 8s., and soya bean oil at 7s. 6d. per gallon. Australian castor oil is to be had at 7s. 6d. Fish oils weak. Japanese cod oil on offer at 4s. 6d., and herring No. 1. at 4s. 3d., while New Zealand whale oil has sellers at 4s. In sympathy with the rise in the value of tallow, candles have advanced in price about ½d. per lb., and all tallow derivatives are higher. It is stated that soaps, what with tallow prices, and the other ingredients advancing, are now about 75 per cent. dearer than they were a few months ago.

SCIENTIFIC PRODUCTS EXHIBITION.—A notable exhibit at the British Scientific Products Exhibition, now being held in London, is that of the Lennox Foundry Co. Ltd., Tantiron Foundry, Glenville Grove, London, S.E. 8. In addition to working plant which is on view, photographs are shown of chemical plant manufactured by them, including autoclaves up to 500 gallons capacity and for pressures up to 50 atmospheres; compressors for Haber synthetic ammonia plant; nitrate of ammonia separators (plants having a capacity of 70 tons per day have been constructed); and semi-industrial electrically-heated plant for vacuum drying, etc. The Lennox Foundry Company also show their well-known acid-resisting metal, "Tantiron," in various forms, including special metal for hydrochloric acid.

BRITISH ASSOCIATION OF CHEMISTS.

"It we don't hang together we shall assuredly all hang separately."
—JOHN HANCOCK, when signing the Declaration of Independence.

Hon. Registrar: Dr. FRANCIS W. KAY,
Chemical Department, The University,
Liverpool.

NOTICES.

NOTICES and reports from secretaries of local Sections and articles and correspondence for these pages should be sent to the hon. editor, Dr. E. H. Rodd, 7, Mauldeth Road West, Withington, Manchester, and not to the *Chemical Trade Journal and Chemical Engineer*.

The hon. editor will be glad to receive short articles on the views of members with respect to the B.A.C., its aims and aspirations, for publication in these pages. Such articles should be accompanied by the name and address of the writer, not necessarily for publication.

Reprints of the proceedings of the British Association of Chemists as published in the *Chemical Trade Journal and Chemical Engineer* can be obtained from the hon. editor on payment of an annual subscription of 4s.

Applications for membership of the B.A.C. should be sent to the Registrar, Dr. F. W. Kay, not to the Hon. Editor.

THE PROCEEDINGS OF THE ASSOCIATION.

The Council.

A meeting of the Council was held on Saturday, July 12, at the St James's Hotel, Derby, Professor J. W. Hinchley in the chair, and ten members present.

Nominations Committee.—On the recommendation of the Nominations Committee, forty-seven candidates were elected to full membership of the Association. A number of other names of candidates were submitted, but were referred back to the Nominations Committee. These latter names had been referred back by the Nominations Committee to the local assessors, by whom, after further scrutiny, they had been approved, but they had not been finally confirmed by the Nominations Committee. Complaints of delay in dealing with applications have been made, but it was pointed out that the Nominations Committee have a difficult task to perform, requiring considerable care, and that there is a certain amount of inevitable delay because the members of the committee live in different parts of the country. The work is to be accelerated as much as possible.

It was reported that certain sections have not yet appointed local assessors, and a motion proposed by Mr. Millington, seconded by Mr. Crowther, "That local sections which have not appointed assessors be asked to do so at once," was carried unanimously.

Whitley Councils Committee.—The minutes of a conference held in Manchester on June 21 between the National Union of Scientific Workers, the National Association of Industrial Chemists, the Oil and Colour Chemists' Association, and the British Association of Chemists to consider the question of the representation of chemists on Whitley Councils, were read by Dr. Forster. At this meeting the practical steps to be taken for the formation of a federal body representing the various societies had been considered, but little progress had been made, because some of the delegates had not been invested with full powers by the societies which they represented. The Whitley Councils Committee of the B.A.C. therefore requested to be given authority to come to definite decisions on behalf of the Association at the next conference. After a lengthy discussion, a motion was carried unanimously: "That the delegates attending the next conference should have full power to act for the B.A.C., but that the result be submitted to the Council for ratification."

Trade Union Registration.—Mr. Millington submitted the first draft of the proposed regulations. It was agreed that a copy of this draft be sent to all local section committees for suggestions and amendments, which are to be forwarded to Mr. W. E. Kay. The draft is then to be submitted to a solicitor.

Munition Chemists Committee.—The Committee appointed at the last meeting of the Council to inquire into the treatment of chemists employed by the Ministry of Munitions presented a full report. It was shown clearly in the report that the Ministry refused to consider applications for a revision the scale of salaries of chemists because the chemists were taking joint action, whilst, at the same time, the Government were encouraging the organisation of other classes of workers in self-defence by promoting the formation of Whitley Councils. It was decided to bring the matter before the notice of Parliament with the least possible delay. Pro-

fessor Hinchley promising to approach members of Parliament at once.

Salaries.—The question of minimum salaries for qualified chemists came up for discussion, and various suggestions were made. As some of the sections had not yet given the matter full consideration, it was decided to submit the proposals to the local sections for them to consider before coming to a final decision.

Income Tax Rebate.—The question of income tax rebate for chemists on account of books, subscriptions to societies, and other necessary expenses of the professional chemist, was brought forward for discussion by the Leeds and Bradford section. It was pointed out that at present the granting of a rebate seemed to depend on the personal idiosyncrasies of the local surveyor of taxes. The Society of Dyers and Colourists has definitely obtained a rebate on the subscription of its members, and there is no reason why all subscriptions should not be exempt from tax. It was resolved: "That the members of the Committees should send any suggestions with regard to rebate on income tax to the secretary of the Leeds and Bradford section, who shall draft a letter to the Income Tax Commissioners for submission to the next Council meeting."

Other Business.—A letter was read from Miss A. S. White, of the Chemists' Department of the Admiralty, Portsmouth, asking for propaganda material in connection with the B.A.C., and for a list of chemists in Government employment who have joined the Association to date. It was resolved: "That Miss White be asked to act as consul to the Civil Service Section of the Portsmouth district for the B.A.C."

In connection with the advertisements which are discussed in a separate article in this issue, the Council decided to take action by writing to the editors of the journals in which the advertisements appeared, pointing out their undesirable character.

A motion was passed requesting local secretaries to supply matter for the Proceedings of the Association for publication in the *Chemical Trade Journal and Chemical Engineer* at least once a month.

The next meeting of the Council will be held at Derby on August 23.

UNPROFESSIONAL CONDUCT.

At the meeting at Derby on July 12 the attention of the Council was drawn to two advertisements which had recently appeared in the technical press, and which revealed the possibility of the existence of two forms of very undesirable conduct practised, presumably by members of the chemical profession. Such practices are unanimously condemned by the Council as being against the best interests of all members of the profession, whether employers or employees, and it is felt that they should be brought prominently before the notice of the members of the B.A.C.

The first example is contained in an advertisement in which a prize of £100. is offered for the best descriptive method of producing a commercial chemical of a prescribed strength and purity. The offer may have been perfectly innocently made by the advertiser, but the procedure furnishes obviously a means of obtaining the greatest possible amount of information for the least possible outlay—a sprat to catch a whale; a prize of £100. in exchange for perhaps many thousands of pounds profit. Apparently all the competitors for the prize put their information unreservedly at the disposal of the advertiser, who, although he may reluctantly be compelled to withhold the prize on account of none of the attempts being suitable for his purpose, may still make out a composite process from the information thus gained gratuitously.

Who, it may be asked, is likely to enter for this competition? Not a manufacturer having a working process. Nor, it is to be hoped, would a chemist or a workman employed by such a manufacturer sell the confidential information which he has acquired in the course of his service. On the other hand, no chemist who had laboriously worked out a process at his own expense would be likely to part with information on the chance of winning an amount which might easily be less than he had expended on his research. Many chemists are, however, so poorly paid that the prize offered might be a real temptation to some of them to commit a breach of trust. It is difficult to conceive to whom the advertisement would appeal except to such people as these, and in these circumstances the method of procedure cannot be too severely condemned. Any person who wishes to obtain information regarding a chemical manufacturing process can approach a consulting chemist, or employ research chemists of

his own, or make a reasonable arrangement with somebody having practical experience of the subject. The offer of a prize, as in this instance, gives rise to grave suspicion.

In the second case to which the attention of the Council was drawn, an analytical chemist was advertised for, and applicants were required to carry out a difficult test analysis before their applications for the post could be considered. Up to the present, so far as is known, the advertiser has proved very difficult to satisfy, or is extremely slow in coming to a decision. Here, again, it appears that the information is being obtained "on the cheap." The analyses are done, and the advertiser is under no obligation to employ the applicant or to pay him a farthing for the work he has carried out. The procedure is one which must be condemned. A chemist must be accepted on the strength of his qualifications, to obtain which he has been through an expensive training. When a standard qualification is recognised for all chemists we shall be adequately protected against such attempts at exploitation, and this is one of the objects for which the B.A.C. is fighting. These two instances emphasise most strongly the need for thorough organisation of our profession on the lines which have been adopted by the B.A.C.—the union of all qualified chemists for their economic welfare.

A SWEATED INDUSTRY.

The following has been received from a correspondent:—"It was with great interest that I read the article 'A Sweated Industry' in your issue of July 5, and I can fully endorse the same. I am an analytical chemist and assayer with considerable experience during the past 16 years both here and abroad. I have just returned from the front, where I was chief gas officer to the 1st Australian Division, with which I left Australia in 1914. On arriving here last January I looked around for months for a position, and was really astonished at the salaries offered to experienced men. The standard appears to be £150., and this is ridiculous in these days. Further, girls seem to be preferred to men.

"What sort of a show would we have made in the past war if we had not had the services of our chemists? Think of the gas attacks and the experiments and research which had to be carried out before we got the upper hand in this direction. Then, again, look at the advance made with our flying machines, which would not have been possible without the aid of chemists. Many of our people do not seem to realise this. Our profession is the worst paid of all; and, personally, I am sorry now that I did not go in for coal-mining, as the miners appear to get all they ask for!"

Our correspondent concludes with the suggestion that the B.A.C. should organise an employment bureau, keep a register of qualified chemists, and secure for chemists a reasonable standard of salaries. All these matters are, of course, engaging the closest attention of the Council, and are gradually becoming materialised.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

The outlook in West Cumberland has worsened rather than improved. It is true that there is as yet no slackening in the demand for the low phosphorus brands of iron, but requirements of ordinary iron are dwindling, and there is a furnace less in blast this week on the kind of iron for which the local coke is used. The prospects are not good. Rail-makers on the coast are working from hand to mouth. They are not able to get orders in face of the American competition, and there seems nothing for it presently but the closing down of the rolling mills at Workington and Barrow. In that case, of course, the coking industry will be the first to suffer, and unless an export market can be found it is to be feared that most if not all of the plants will be laid idle. Up to the present, however, all but one of the coking plants are working, though only at two-thirds of their capacity; and the make of by-products has, of course, correspondingly declined. None, save benzole and sulphate of ammonia, however, are in keen request. Benzole is being taken largely by Irish users, but there is also a good local market for the spirit. Sulphate of ammonia is freely absorbed, in spite of the fact that none of it is going abroad. Pitch and creosote are in diminished demand, and very little in fact has been shipped of late. For other by-products the demand is extremely limited, and a portion of the plant of the chemical works is idle.

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

Abbey Chemical Company, Ltd., London, E.C.—J. Fabian, 27, Clements Lane, E.C., chartered accountant, appointed receiver July 11.

Boundary Chemical Company, Ltd.—Resolved June 23, confirmed July 9: That the company be wound up. H. Sadler, 31, North John Street, Liverpool, chartered accountant, liquidator.

Craven Lime Company, Ltd.—Resolved June 23, confirmed July 14: That the company be wound up with a view to its reconstruction. G. H. Archer, Burley Grange, Leeds, liquidator, who is authorised to consent to the registration of a new company.

New Cheshire Salt Company, Ltd.—Resolved June 18, confirmed July 16: That the company be wound up. E. Andrews, 13, Eastgate Row North, Chester, incorporated accountant, liquidator. Meeting of creditors at liquidator's, July 31.

Pusing Bharu Tin Mines, Ltd.—Resolved June 26, confirmed July 14: That the company be wound up. H. P. Hood, 65, London Wall, E.C., liquidator. Meeting of creditors at liquidator's, July 31.

Pusing Lama Tin Mines, Ltd.—Resolved June 26, confirmed July 14: That the company be wound up. H. P. Hood, 65, London Wall, E.C., liquidator. Meeting of creditors at liquidator's, July 31.

Siputeh Tin Mines, Ltd.—Resolved June 26, confirmed July 14: That the company be wound up. H. P. Hood, 65, London Wall, E.C., liquidator. Meeting of creditors at liquidator's, July 31.

Treburland Wolfram and Tin Company, Ltd., London, E.C.—Meeting of creditors registered office, 87, Bishopsgate, E.C., August 1, at 12 noon.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Bowley, S., and Son (Joseph Jno. Bowley and Joseph Plunkett Bowley), Wellington Works, Wellington Road, Battersea Bridge, oil importers and refiners. August 21, 1918. (July 18.)

Couch and Co. (Geo. Edwd. Hunt, Wm. Ernest Moist, Chas. Wright, and Francis Joseph Emblem), Berkley Metal Works, Berkley Street, Birmingham, metal refiners. June 30. Debts by G. E. Hunt and W. E. Moist at 6, Berkley Street, Birmingham. (July 15.)

NEW COMPANIES.

Associated Lead Manufacturers, Ltd.—Capital £1,500,000., in 1,000,000 preference and 500,000 ordinary shares of £1. each. Office: 70, Lombard Street, E.C.

Carbon Smokeless Fuel, Ltd.—Capital £75,000., £1. shares. Object: To acquire coal mines, coal, coke, coal gas, and chemical substances for the manufacture of benzole and sulphate of ammonia. Office: 5, Albany Court Yard, Piccadilly, W.

Forster's Glass Company, Ltd.—Capital £350,000., £1. shares (175,000 7½ per cent. cumulative preference). Registered office: Atlas Glass Works, St. Helens, Lancs.

Gwinear Tin Mines, Ltd.—Capital £60,000., 5s. shares. Office: 63-4, New Broad Street, E.C. 2.

Activated Sludge Company, Ltd.—Private company. Capital £30,000., £1. shares. Object: To acquire a process of sewage purification and of treatment of residual sewage known as the Activated Sludge Process, carried on by Jones and Attwood, Ltd., at the Titan Works, Stourbridge. Solicitors: Harward and Evers, High Street, Stourbridge.

Broughton Dye Manufactory, Ltd.—Private company. Capital £2,000., £1. shares. Object: To acquire the business of dye manufacturers carried on by Shinzo Yamaji and J. F. Gleave at Manchester. Solicitor: F. C. Webb, 26, Corporation Street, Manchester.

Cooper Metals (Coventry), Ltd.—Private company. Capital £3,000., £1. shares. Office: 42, Earl Street, Coventry.

ITEMS OF INTEREST.

SCIENTIFIC PRODUCTS EXHIBITION AT GLASGOW.—Glasgow Corporation has arranged for the British Science and Key Industries Exhibition to be held there from November 17 to November 29.

PATENTS AND TRADE MARK CONGRESS AT BRUSSELS.—An International Congress of Allies and Neutrals to discuss the question of Patents and Trade Marks is being organised to take place at Brussels in September.

FIRE.—Damage estimated at £20,000.. was caused by a fire at the basic slag works of Messrs. Bolckow, Vaughan and Co., between South Bank and Grangetown, near Middlesbrough, on Saturday night. The works were completely gutted, and much valuable plant and machinery were destroyed.

NEW INDUSTRY AT SELBY.—A new enterprise is reported from Selby (Yorks.). Several acres of land in the Holmes, near this market town, have been purchased for the erection thereon of a chemical works. It is stated to be for a firm of Swiss manufacturers, and one of the principal products will be eau-de-Cologne.

CHEMICAL WORKS FATALITY.—A fatal accident occurred at the United Alkali Co.'s works, Flint, on Wednesday. Two workmen, John Henry Martin and William Williams, were working in an acid still, when it collapsed. Martin was completely buried, and when rescued was found to be dead. Williams received serious injuries.

REPORTED SALE OF OLYMPIA OIL MILLS.—A Darlington newspaper last week announced that the Olympia Oil and Cake Mills at Selby, and the associated undertakings of the Selby Warehouse and Transport Company and Ardol, Ltd., were being transferred to other ownership, and mentioned the name of Jurgens, Ltd., margarine manufacturers.

REVISED FRENCH IMPORT REGULATIONS.—The *Board of Trade Journal* publishes a translation of the new French official decree, further relaxing the import restrictions, as from July 13. Import prohibitions in respect of the following, among other, articles are abolished: Potash, coal-tar dyes and intermediate coal-tar products, and perfumery.

OBITUARY.—Mr. George Thomas Barker, for many years manager at the Runcorn works of the United Alkali Co., Ltd., died suddenly on Friday of last week, at the age of 51 years.—The death is announced, at 67 years of age, of Professor Emil Fischer, professor of chemistry in the University of Berlin, foreign member of the Royal Society, and Nobel laureate in chemistry in 1902.

SILVER CHLORIDE.—An investigation of the vapour pressure of silver chloride is in progress at the Berkeley station of the U.S. Bureau of Mines. The method is not yet sufficiently standardised to yield thoroughly reliable results, but the work so far indicates that the vapour pressure of silver chloride is less than 5mm. at 1,000°C., and in the vicinity of 15mm. at 1,150°C. It is therefore much less volatile than lead chloride.

PERSONAL.—It is announced that Professor W. M. Gardner, Head of the Chemistry and Dyeing Department of Bradford Technical College since 1895, and Principal of the College since 1906, is retiring on account of ill-health.—Owing to continued ill-health, Mr. Cyril Haslam has been obliged to resign the chairmanship of Joseph Crosfield and Sons, Ltd., Warrington. The directors have elected Mr. Giles Hunt to be chairman in his place.

LIMESTONE RESOURCES OF NEW SOUTH WALES.—The great importance of the limestone industry to New South Wales is emphasised in a publication issued by the State Department of Mines. The value of the annual production of limestone and its products within the State has risen from an insignificant amount until now it exceeds £500,000, and ranks sixth in importance of the mineral industries of New South Wales. This marked growth is due primarily to the rapid increase in the output of Portland cement since the first modern plant, fitted with rotary kilns, was erected in 1901, the annual production having increased from about 10,000 tons in 1900 to approximately 130,000 tons in 1917. The numerous analyses given, except in specified cases, must, in view of the large areas represented by some of the samples, be taken only as indicative of the composition of the limestone in question. In the event of any of these deposits being commercially exploited for purposes where a uniform quality of limestone is imperative, more adequate bulk sampling, together with careful analytical tests of different bands or beds in the deposit, would, of course, be necessary.

NEW ISSUES.—Borax, Consolidated, Ltd., are issuing 250,000 deferred ordinary shares of £1. each at 37s. 6d. per share, ranking with the existing shares for dividend from October 1 last.—Formed with a capital of £250,000. in £1. ordinary shares, the Oilfields of England now invite subscriptions for 170,000 of these at par. The company has been granted a Government licence to bore for and produce petroleum oil within an area of about eight square miles, known as the Kelham Estate, situated near Newark, in the county of Nottingham.

NEW FRENCH CUSTOMS DUTIES.—By a French Presidential decree of July 8, the Customs duties leviable on a large number of manufactured goods on importation into France and Algeria were increased. For this purpose, for each category of goods specified in the tariff a "coefficient" or multiplier was fixed respecting the relation between the values of the goods in 1913 and in 1918 according to the official valuations laid down for those years by the Permanent Commission on Customs Values. The present rates of duty are therefore the specific rates contained in the pre-war tariff multiplied by the "coefficient" (varying from 1.1 to 3) attributed to the class of article concerned. In the case of "chemical products obtained from coal tar," for example, the "coefficient" is 2.5; and for "dyes derived from coal tar, picric acid, and other colouring matters," the "coefficient" is 3.

BUSINESS NOTICE.—We are informed that owing to the rapid extension of their business, the Deptford Steel and Ironworks, Ltd., incorporating the Homogeneous Lead Coating Co., have agreed to lease an extensive new factory in Bradley Mills Road, Huddersfield, in order to carry on their business of chemical plumbers and electro-platers, which was started at Deptford in 1915. The company's specialities are the homogeneous lead lining and coating of receivers, tanks and chemical plant of all description, electro-tinning, zincing, leading and coppering, also sherardising. The results obtained in practice by their special process of homogeneous lead lining have proved to be of utmost value to the chemical trade, especially those processes in which the vessels in use have to be subjected alternatively to pressure and vacuum. We understand that at the present time they have large orders in hand for electro-tinning vessels for holding the various oils used in the manufacture of margarine.

SOAP, OIL, AND CANDLE WORKERS' DEMANDS.—Dissatisfaction in the soap, candle, and oil refining industries was discussed at a gathering of workers in the Port Sunlight and Bromborough district on Sunday last. Recently a demand was made before the Court of Arbitration for 15s. per week advance for men and 7s. 6d. per week for youths and women, and it was refused. Reports from Leeds, Manchester, Birmingham, London, Glasgow, Bristol, and other places were submitted as to the feeling of the workers, and the Port Sunlight shop stewards committee during the week had passed a resolution requesting the Union Executive to take action within ten days. Mr. Jones, one of the organisers, said they had to meet the Industrial Council in the trade in order that the matter might first be discussed with the employers, and, should no result come of the effort, then the Executive would probably ask for more serious support. A resolution to defer further action until after the Industrial Council meeting was unanimously passed.

SELENIUM APPLICATIONS.—In an article on selenium and its applications, by L. Ancel (*Chimie et Industrie*), attention is drawn, among other things—mostly well known—to the use of selenium cells as smoke recorders in chimneys. A selenium cell is mounted on one side of a chimney or flue; on the opposite side is fixed a lamp. The amount of light falling upon the selenium and hence the resistance of the cell will depend upon the density of the smoke in the flue; the fire can therefore be controlled by the galvanometer records. Ancel describes the device very briefly; he mentions that the cell should admit of easy access, so that the smoke settling on the glass cover of the cell may be wiped off, and also that selenium cells are very sensitive to infra-red heat rays as well as to light. It is not settled yet, in fact, whether the light effect on selenium is not essentially a heat effect; that point would in a way militate against the reliability of the selenium cell to act as a smoke recorder. We should also like to hear more about the other novel application of selenium cells, mentioned by Ancel, for controlling the contact sulphuric acid process by the degree of the transparency of the gases in the reaction tube. Ancel, however, does not give any technical data.—*Engineering*.

PARLIAMENTARY NEWS.

Patents and Designs Bill

IN the House of Commons on Monday, Sir A. Geddes, President of the Board of Trade, moved the second reading of the Patents and Designs Bill. He said it was very urgent that we should have, now that we were looking forward to restoring trade, certain new powers and improvements in our patent laws. Broadly, the position of the bill was to improve the position of the inventor, and to make it easier for the man without capital who was an inventor to get the fruits of his invention to himself, and remove him from the position in which so many poor inventors were of having to part far below the real value of their inventions with their rights in them in order that they might be worked at all. That was provided for under Clause 2. Under Clause 1 they had a whole series of arrangements by which they hoped to prevent the abuse of patents, whereby in the case of certain foreign-owned patents the mere fact that this country gave patent protection was utilised by unscrupulous competitors to do damage to the country whose benefits they were receiving. In Clause 6 there was a very important provision with regard to the duration of protection which a patent conferred. The present duration of protection was 14 years. They proposed that it should be increased to 16 years. During the war it had been quite impossible to get many patents worked, and inventors had lost some years which might have been fruitful. It seemed an act of justice, therefore, that there should be an extra period of protection given. In addition to the automatic extension of two years they also had certain provisions which would enable on cause shown a further extension to be obtained by those who had suffered. By the combination of these two methods they hoped to meet the difficulty and also to give greater encouragement to the inventor. There were in Clause 18 provisions for dealing with the patent agent and transforming that calling into a profession.

Mr. Wallace directed attention to the position in the boot and shoe machinery trade, which, he said, was held as a monopoly in this country to the extent of 85 per cent. by an English company with headquarters at Leicester—the British United Shoe Machinery Company. Though it was registered in Leicester, it was really an American company in disguise. The American Company controlled the whole policy of the English company. In about twelve years they succeeded in eliminating all other competition in the United States. They bought up every possible patent, and in that period profits to the extent of 50,000,000 dollars had been amassed. At present the company controlled 98 per cent. of the whole trade in America. If a bootmaker wanted to buy boot and shoe machinery he found he could not buy it from the English company, but he could only lease it on certain onerous terms. Taking the case of a firm which wished to instal a machine or the British Machinery Company, it was leased under certain conditions over a term of years. At the same time the firm must bind itself that whenever any other machine would run out they would on no account buy from any other firm. If in the course of a year or two the firm had bought one or two other machines and leases were running out at different times, they discovered that once they were within the meshes of that company there was absolutely no escape. He thought that was an intolerable position for a great British industry. In the interest of freedom of trade and commerce, and from the point of view of encouraging legitimate competition and stimulating British invention, he hoped the President of the Board of Trade would seriously consider the effect of this position on the boot and shoe machinery trade in this country. He moved the rejection of the measure.

Sir E. Jones seconded, and expressed disappointment and astonishment that the President of the Board of Trade had not provided for dealing with this serious matter spoken of by Mr. Wallace. It was a monopoly which during the war had been found to be too powerful for the Government.

Sir G. Croydon Marks said that Clause 1 of the bill dealt very effectually with the very abuse of which hon. members had complained. It remedied it in a way the Americans could not get round. The moment the bill passed every American licence was nullified. He urged that patents ought to be extended beyond sixteen years. While there had been five years of war, and five years of taxes paid and Government fees received, the Government were now going to give only two years extension, and he thought in that respect the Government had not gone far enough.

Mr. W. Graham said that there was no desire on the part of the promoters of the motion to deter the progress of the bill,

but what they were concerned with was to make absolutely certain that the bill would meet a very difficult and a very trying set of circumstances of the highest importance to industry in this country. They would not press their motion for rejection but they urged that it must be strengthened to deal with the trust influences otherwise it would largely fail to attain the object it had in view.

Sir W. Pearce thought the House would be glad to hear that hon. members did not intend to press their motion for the rejection of the bill. They had made a very strong case, and if Clause 1 did not meet the case, perhaps the Government might be prepared to agree to Amendments in Committee. But there was no provision, so far as he could see, to meet what had happened during the war. During the war any application for a patent had been obliged to carry nationality, and there had been a good many restrictions which provided that everybody should know on whose behalf protection or a patent was required. He was not at all sure something of the same sort was not necessary in this bill, and he could see nothing of the kind to meet what had been instituted during the war. He welcomed the bill as a great improvement on the bill which was drafted in 1917. He was sure the Government had been wise in extending the term limiting the duration of patents from fourteen to sixteen years. They had not gone as far as industry and science desired, but they had gone some way. Not only during the war had it not been possible to work a patent, but during the present time it was difficult to get any plant to put a patent into operation, and therefore he was quite sure the Government had been wise in granting this extension. Clause II. was a great improvement, speaking for the chemical industry. The Clause, as now drafted, depended upon process rather than the actual substance itself, and in that, he thought the Government had taken the right view. He noticed that no difference had been made in the Court of Appeal. He knew that scientific industry would be very glad to see a different Court of Appeal. They would like a special Court with technical knowledge. It had been pressed upon the Government on many occasions, and he would like again to suggest to them that, when the bill got into Committee, they might be prepared to listen to suggestions of that kind. But in many respects the bill was a great improvement. It was a great addition to the law of 1907, and a great improvement on the Government's first attempt in 1917.

The Solicitor-General (Sir E. Pollock) said that within the proper limits of a Patent Bill he thought that his right hon. friend had gone as far as he ought to go. But in regard to those trusts and the restraint of trade, these must be dealt with in a trust bill, which, he understood, would be introduced in the autumn. The bill was read a second time.

Trade Marks Bill.

Sir Auckland Geddes in moving the second reading of the Trade Marks Bill, said that it fell naturally into three parts, the last part being a series of minor amendments of existing legislation. The first and second parts were of some importance. The first part of the bill proposed that there should be a second class of trade mark rather different from that with which we had been familiar. It was intended to have a list of trade marks which had a common law existence and could be protected. For that purpose it was proposed to have a Part B of the Register of Trade Marks, and it would be much easier for anyone who wished to register to get on to that part than on to Part A. The second part of the bill was of very considerable practical importance. There was a great abuse at the present time in connection with the use of words in trading, and it was to deal with that abuse that this second part of the bill was designed. For example, there was the case of drugs which in the past were patent drugs. During the course of their existence their name had become the one practical description of them, and when the name became a trade mark they had a permanent continuation of the patent protection. Aspirin was a case in point. It was to deal with these blocking names of other manufacturers of the same chemical substances that this bill was brought before the House. It was not an ambitious measure, but quite a modest one, and he thought that it would make a great improvement in our present legislation governing the use and protection of trade marks.

The bill was read a second time.

Alcohol Motor Fuel.

Mr. Manville asked the Prime Minister what action, if any, has been taken to give effect to recommendation No. 17 of the Interdepartmental Committee on Alcohol Motor Fuel, which Committee reported under date June 23 last (Command Paper

(Continued on page 125.)

PARLIAMENTARY NEWS.

(Continued from page 124.)

No. 218) that an official organisation, permanent in character and provided with the necessary funds, should be established forthwith by the Government to encourage and develop the production and utilisation of power alcohol within the Empire as a fuel alternative to petrol?

Mr. Bonar Law: The report has been referred to the Scientific and Industrial Research Department, with special reference to the Recommendation No. 17, and the question is at the moment under consideration.

Nitrogen Products Committee Report.

Captain W. Benn asked the Parliamentary Secretary to the Ministry of Munitions whether the report of the Nitrogen Products Committee is ready; if so, when will it be published; and whether other countries are already establishing factories and availing themselves of the investigations made by this Committee?

Mr. Hope: The report has been received and is under consideration, as is also the question of publication. I am not aware of action being taken in other countries such as that suggested in the question.

Woolwich Arsenal Cordite Fire.

Sir Kingsley Wood asked the Parliamentary Secretary to the Ministry of Munitions whether he can make any statement concerning the cordite fire which took place at Woolwich Arsenal on July 23.

Mr. Hope: The fire in question occurred during the breaking down of unserviceable small arms ammunition. During the operation of extracting the cordite one of the cartridges caught fire. It is surmised that some of the cap composition had broken loose and had got into the cartridge case, and that friction caused by the extraction of the cordite ignited it. The flame spread to other cartridges and caused a fire. This is the first instance that has occurred of any ignition of the charge, though the operation of breaking down small arms ammunition has been going on since 1917.

LEGAL INTELLIGENCE.

Starch Contract.

In the King's Bench Division on Monday, Mr. Justice Bailhache gave judgment in an action brought by Messrs. Joseph Cowden and Co., Liverpool, against the Corn Products Co., Ltd., London, for damages for alleged breach of contract in connection with a shipment of 770 tons of starch. The defendants relied upon the *force majeure* clause in the contract.

Mr. Justice Bailhache, in giving judgment, said the defendants had not succeeded in bringing their case within the protection of the *force majeure* clause. The defendants had failed to prove to his satisfaction that they made the necessary contracts for the shipping space required for the conveyance of the goods. His Lordship also saw no evidence at all to show that if such space was secured it was in fact commandeered by the British authorities. There must be judgment against the defendants.

His Lordship left the question of damages standing over to see if the parties could agree between themselves. It might be that business men could arrange it by some further contract. He would take the date of the breach as around the end of February or the beginning of March.

After counsel for the parties had consulted together, Mr. A. Neilson, K.C., for the defendants, announced that it was agreed that the price of starch should be based at 80s. instead of 100s. a cwt. He asked for a stay of execution as an enormous sum of money was involved. The claim was for upwards of £46,000., but by the agreement which he announced it might be reduced to somewhere in the neighbourhood of £20,000.

His Lordship granted a stay of execution provided the money was paid into court and an appeal entered within fourteen days.

Failure of a Chemical Engineer.

At the London Bankruptcy Court on Friday last week, before Mr. Francke, the public examination was appointed to be held of George Edward Heyl, described as a consulting chemical engineer, carrying on business at King's House, Kingsway, W.C., lately residing at 78a, Lexham Gardens,

Kensington. The statement of affairs filed by the debtor disclosed gross liabilities amounting to £77,760. 18s. 3d., of which £70,895 18s. 11d. was due to unsecured creditors. The assets consisted of trade fixtures, fittings, utensils, etc., valued at £100., and "consideration for sale of debtor's interest in processes, leases, buildings, plant, book debts, cash and stock at Barking and Corton, near Weymouth, to a company," which the debtor estimated to be worth £300,000., and one book debt for £20., making the total assets amount to £300,120., from which have to be deducted seven creditors for rent, etc., amounting to £313. 12s. 8d., leaving the net assets at £299,806. 7s. 4d., thus showing a surplus of assets over liabilities of £228,910. 8s. 5d.

Upon the debtor's name being called, he did not respond, and the Official Receiver stated that he understood the bankrupt had been granted a passport to go out to Esthonia. He asked that the examination might be adjourned *sine die*, and the learned Registrar said he would grant that application, but at the same time he thought the Official Receiver should write to the Foreign Office to the effect that by the debtor being granted a passport, the Order of the Bankruptcy Court was being set at defiance.

The debtor's solicitor promised to advise his client to surrender to the Court as soon as he returned, but the Official Receiver said he was going to apply for a warrant for the debtor's arrest.

Compensation for an Explosion.

Lord Justice Scrutton, sitting in the King's Bench Division on Wednesday, gave a considered judgment in a case that had been before him for some days arising out of an explosion in September, 1916, at the Rainham Chemical Company's works, when considerable loss of life and damage to property resulted. The plaintiffs, the Belvedere Fish Guano Company, Ltd., claimed to recover in respect of the damage to their works against the Chemical Company and Messrs. S. J. Feltham and R. W. Partridge.

Lord Justice Scrutton held that the plaintiffs were entitled to recover against all three defendants, and there would be a reference for the assessment of the damages.

In the second claim (by Messrs. Ind, Coope and Co.) he also gave judgment for the plaintiffs against the same defendants. Other defendants in that case were given judgment in their favour.

Sequel to a Deal in Soft Soap.

In the Lord Mayor's Court, on Monday, before the Recorder (Sir Forrest Fulton, K.C.), a claim was made by Mr. Frederick Archibald Roberts, trading as the Alliance Trade Extension Agency, general agents and merchants, of Camomile Street, E.C., against Mr. Arthur Bennett, Seeley Street, Tooting, for £35. in respect of the purchase of a ton of soft soap from the defendant which was not delivered.

Mr. Power, counsel for the plaintiff, said that on September 7 last plaintiff bought from the defendant one ton of soft soap at the price of £32. 10s. per ton. Defendant undertook to arrange for delivery. On September 12 defendant called upon the plaintiff and stated that the soap was ready for delivery. The plaintiff gave the defendant a cheque for the price of soap on the faith of the representations that the soap was ready for delivery. The plaintiff's cheque had been cleared, but he had never seen the soap. The defendant was written to on several occasions about the matter, and it was only when the matter was placed in the hands of the solicitor that a letter was written by the defendant, in which he alleged that the sale of the soft soap was made by a company and not by him (defendant). Plaintiff gave evidence in support of his claim, and said had the soap been delivered in accordance with the arrangements he could have resold it at a price of £58. per ton. In those proceedings he was claiming a nominal sum of £2. 10s. for loss of profit, which together with the return of the money paid for the soap made up the sum sued for. There was no truth in the suggestion that he had dealt with a company in the matter and not the defendant.

Cross-examined by the defendant, who conducted his case in person, plaintiff said the only receipt he had for his money was his cheque. He had no sale note.

The defendant, in his evidence, said that the deal in soft soap was made by him for the British Flour Co., Ltd. He had not had the benefit of the money paid him by the plaintiff; it went to the British Flour Co., Ltd.

The Recorder, after hearing the evidence, gave judgment for the plaintiff for the amount claimed, with costs.

REPORTS OF COMPANIES.

Mond Nickel Company, Ltd.

The annual general meeting was held in London on July 24; Mr. Robert Mond, J.P. (chairman of the company), presided.

The Chairman, in moving the adoption of the report and accounts, said that the board had placed the whole of the company's output of nickel at the disposal of the Government during the war, and, in spite of difficulties of labour and material, had doubled the output between 1914 and 1917. But for those difficulties the plant for trebling the pre-war output would have been completed. The make of their other main product—copper sulphate—had also doubled during the war. It was chiefly used for agricultural purposes, and as a result of lengthy chemical research the company had been able to elaborate a mixture called "Blighty," which only required dissolving in the requisite amount of water to form the best spraying mixture. They were satisfied with the progress that article had made on the market. In common with other manufacturing concerns, their cost of production had been immensely increased in the course of the war; but notwithstanding they had succeeded in selling their nickel to the Government at only comparatively slight advances, as they had realised much higher prices for their copper sulphate in the export markets. At home the Board of Agriculture had fixed a much lower price for copper sulphate than that ruling abroad, by which the farmers in this country had benefited. The platinum and palladium from the residues of the refining process had helped to supply the enormous war demand for these precious metals. Dealing with the accounts, the Chairman said that the issue of preference shares last December had been a great success. As regarded stocks, the figure of £2,200,741. showed a large increase, the fact being that, whereas the special war demand for their products had ceased when the armistice was signed, the peace demand did not revive during the financial year; but the directors felt confident, now that the peace treaty had been signed, the revival of trade would within a reasonable time bring those stocks down to a more normal level.

Sir Robert A. Hadfield, Bart., seconded the motion, and it was carried unanimously.

Nobel's Explosives Company, Ltd.

Sir Ralph W. Anstruther presided at the annual meeting held in Glasgow, and moved the adoption of the report, which stated that the net profit for 1918, after providing for depreciation, was £568,615., and £84,881. was brought in. The amount available for distribution, after payment of the preference dividend, was £603,496., and the directors recommend a dividend on the ordinary capital at the rate of 30 per cent., less tax, carrying forward £65,473. The Chairman spoke of the activities of the company during the war; but that was past, and they had to address themselves to problems unconnected with a state of war. Now that the nations of the world were striving to return to peaceful pursuits, the company's products in the industrial sense were amongst those for which the call was made. He was glad to tell them that they were already beginning to feel an increased demand for their commodities. Explosives Trades, Ltd., would be able to direct their activities.

The report was adopted.

Brimsdown Lead Company, Ltd.

Report for 1918 shows net profit of £5,599., after providing for depreciation and income tax. Since the armistice some of the difficulties occasioned by the war have disappeared, and the output has increased. In the early part of this year preference shareholders were invited to express their opinion on a scheme for funding the arrears of preference dividend. The opinion of the majority was in favour of the scheme, but a number of shareholders thought that the present state of the company warranted a somewhat more liberal treatment without greatly disturbing the financial position. The directors are desirous of meeting the wishes of all the shareholders to the utmost extent which the well-being of the company permits, and now suggest the following modification: Instead of their existing shares of 15s. each, the preference shareholders shall take one preference share of 10s. ranking for a non-cumulative dividend at the rate of 7 per cent. per annum from January 1, 1919, and two ordinary shares of 5s. each, all issued as fully paid. Half of the ordinary shares thus issued to preference shareholders will be by way of capital bonus out of undivided profits. Formal resolutions to carry out this object will be submitted.

(Advs. continued from page vii.)

Plant, Apparatus, and Materials
For Sale.—continued.

PARAPHENYLENEDIAMINE
(Ursol). Benzaldehyde.—English manufacturers solicit inquiries; home and export buyers; prompt deliveries; stock.—Box "8,899," Chemical Trade Journal Office, 265, Strand, London, W.C. 2.

SILICA Flour, of all grades, from 20 mesh to 200 mesh; also Extra Fine and Superfine (air-blown) Flour Silica; our 120 mesh grade contains not more than 0.5% residue on interwoven silk test sieve; fine grinding a speciality; grinding of chemicals and minerals undertaken for the trade.—The Star Quarries, Ltd., Cathedral Chambers, 5, St. Werburgh Street, Chester.

FOR Sale.—Best White American
Barvies; spot delivery.—Box "8,950," Chemical Trade Journal Office, 265, Strand, London, W.C. 2.

TWO Horizontal Mixers, by Christy and Norris, 7ft. 6in. long, 6ft. 9in. deep, by 4ft. 6in. wide, constructed of 3in. steel plate, with heavy mixing gears, fitted fast and loose pulleys, 5ft. by 6in. face; almost new.—Box "E.V.," Chemical Trade Journal Office, 265, Strand, London, W.C. 2.

BARIUM Chloride, 3½cwt.; Stearine, 1cwt.; Naphthalenic Acid, 3cwt. Box "8,902," Chemical Trade Journal Office, 265, Strand, London, W.C. 2.

FOR Sale. 10-20 tons Bleaching Powder, in hardwood casks; £12. 10s. per ton, immediate delivery. Particulars, Box No. "H. S. 8,914," Chemical Trade Journal Office, 265, Strand, London, W.C. 2.

Plant, Apparatus, and Materials
For Sale.—continued.

BELLADONNA Leaf.—Produce of about 100 good plants for sale (growing crop); also roots later.—Offers to Box "8,887," Chemical Trade Journal Office, 265, Strand, London, W.C. 2.

FOR Sale.—Three Moritz Mechanical Pyrites Burners, each having 8 shelves, giving a total burning area of about 1,200 sq. ft., and capable of treating about 8 tons of fines per diem; complete with driving gear, air-cooled shafts and arms, gas trunks, hoppers, inspection doors, drying floors, staging, and weigh machine, in sound condition; the burners are of strong construction, and have had very little wear, one being practically new. Four heavy cast-iron Acid Eggs, each about 40 cub. ft. capacity, flanged ends and four flanged services. Inspection and offers invited.—Apply Box No. "8,889," Chemical Trade Journal Office, 265, Strand, London, W.C. 2.

Miscellaneous.

GRINDING of every description of Chemical and other materials for the trade, with improved mills.—Thos. Hill-Jones, Ltd., "Invicta" Mills, Bow Common Lane, London. E. Telegrams: "Medikaster London." Telephone: 3635 East.

George Ellison FOR **ELECTRIC CONTROL GEAR**
BIRMINGHAM

Miscellaneous—continued

GRINDING of Chemicals and Minerals undertaken for the trade; new and up-to-date plant; fine grinding a speciality; complete patent processes carried out under bond of secrecy.—The Star Quarries, Ltd., Cathedral Chambers, 5, St. Werburgh Street, Chester.

WORK two hours daily in your own home. Several pounds weekly easily earned by simply following our valuable printed instructions, which are forwarded for 1s. P.O. also stamped addressed envelope enclosed; I guarantee that failure is impossible; genuine offer, suitable for all. This advertisement is not inserted to deceive the unwary, but to help you to earn an honest living without hard work.—Albert Feather, 95, White Abbey Road, Manningham, Bradford, Yorkshire.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

The specifications of the following applications are not printed by the Patent Office until the complete specifications have been accepted.

July 21st to July 26th (inclusive).

- Continuous Distillation and Fractionation of Petroleum, etc. Allan, H. L. 18,405.
 Product for Manufacture of Paint. Barbe, A. L. 18,392.
 Ethylidene Diacetate and Acetic Anhydride. Boake, Roberts, and Co., A.; and Durraus, T. H. 18,116.
 Separation of Sulphur from Furnace Gases. Collins, C. G. 18,255.
 Distillation of Hydrocarbon Oils. Dalley, C. (Greenway). 18,151.
 Extraction of Tin from Tin-bearing Ores. Laurie, D. Northall-; and Osmosis Co. 18,340.
 Sulphate of Ammonia. Lessing, R. 18,358.
 Soap Powders. Nordiska Fabriker De-No-Fa Aktieselskap. 18,538.
 Polymerisation of Un-saturated Fatty Acids. Nordiska Fabriker De-No-Fa Aktieselskap. 18,541.
 Fertilisers Containing Nitrogen and Phosphoric Acid. Norsk Hydro-Electrisk Kvælstofaktieselskab. 18,536.
 Extraction of Gold. Ormandy, W. R.; and Osmosis Co. 18,341.
 Coating Iron, Steel, etc., with Aluminium, etc. Partridge, H. E.; and Thompson, J. and W. J. 18,498.
 Dehydrating, Reducing, Calcining, or Roasting Minerals, etc. Réol, J. 18,584.
 Distilling Petroleum. Wade, H. (Standard Oil Co.). 18,162 and 18,163.
 Reduction of Ores. Wiberg, F. M. 18,337.
 Continuous Analysis of Gases. Wollaston, T. R. 18,280.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane. W.C.

1915.

- Picric Acid. Heinemann. 11,005.
 1917.
 Recovery of Nickel from Its Sulphide or Oxide. Annable, H. W. C.; and Nickel Concentration, Ltd. 17,031. 129,667
 Nitrates. Adams, H. E. F. Goold-; Partington, J. K.; and Rideal, E. K. 17,670. 129,699
 Construction of Acid-resisting Tanks, Conduits, and the Like. Brookes Chemicals, Ltd.; and Brooke, N. 17,836. 129,709
 Treatment of Smoke and Fume or Other Dust-laden Gas. Gibbs, W. E.; Gilderson, R. J.; and Adams, H. E. F. Goold-. 18,179. 129,721

1918.

- Purification of Hydrogen. Rideal, E. K.; and Taylor, H. S. 4,532. 129,743
 Conducting High-temperature Reactions. Testrup, N.; and Techno-Chemical Laboratories, Ltd. 9,655 and 10,930. 129,758 and 129,771
 Apparatus for the Distillation or Treatment of Ammoniacal Liquors and the Like. Wyld, W. 10,162. 129,765
 Extraction of Lead from Its Ores. Elmore, F. E. 11,126. 129,773
 Ortho-oxy-azo-dyestuffs and Chromium Compounds Thereof. Imray, O. (Soc. of Chemical Industry in Basle). 11,458. 129,782
 Obtaining Nicotine, Potash, etc., from Tobacco, Tobacco Stalks, and Offal Tobacco. Jephcott, H. 11,637. 129,791
 Vulcanisation of Rubber. North British Rubber Co.; and Porritt, B. D. 11,686. 129,798
 Determining and Indicating Heat Losses in Furnaces. Chopin, M. 11,724. 129,804
 Toilet Soaps. Betjemann, J. G. 11,733. 129,807
 Obtaining Bromide Derivatives of Indigo and of Its Homologues. Soc. Chimique des Usines du Rhone. 13,618. 119,860
 Sulphate of Ammonia. Oakbank Oil Company; and Wishart, J. 13,842. 129,850
 Denturist for Rendering Alcohol Unfit for Human Consumption. Joseph, A. F. (Ray, W. N., and Symons, C. T.). 19,095. 129,904
 Continuous-pressure Filtering Process. McCaskell, J. A. 19,133. 129,905

1919.

- Copper Alloy. Berry, W. D. 10,358. 129,956
 Chromium Sulphate. Mooney, F. M. 11,216. 129,958

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Picric Acid. N. H. Graesser and E. Mather, Ruabon, Denbighshire. British Patent, 126,078, of 1916.

Picric acid is separated from liquors or solids containing it, such as the product of nitration, waste nitration liquor, picric acid washings, waste picric acid, etc., by adding benzene or other volatile organic solvent of picric acid, separating the picric acid solution so obtained, and evaporating the solvent therefrom. When treating the nitration product, this may be previously freed from excess of nitric acid and diluted to reduce the concentration of the sulphuric acid. If the liquors contain tarry or other matters soluble in benzene, the solution

may be cooled to crystallise out benzene picrate, which is then decomposed by heat.

Nitric Acid. E. B. Maxted and T. A. Smith, Walsall, Staffordshire. British Patent, 126,704, of 1917.

Nitric acid of high concentration is obtained by the reaction of water, excess of oxygen, and large excess of liquid nitrogen peroxide or trioxide at pressures not appreciably exceeding atmospheric, the excess of nitrogen oxide being subsequently expelled, for instance, by a current of air or by gently heating, but without separating the separate layers when such layers form. According to the Provisional Specification, water vapour, oxygen, and excess of a gaseous nitrogen oxide (including nitric oxide) may be employed, or water vapour, nitrogen oxide, and excess of oxygen.

Purifying Oils. J. L. Mantle, Merry Hill, near Wolverhampton. British Patent, 126,882, of 1918.

Barium chloride is used to desulphurise used lubricating oil from the sumps of internal-combustion engines, or in the course of manufacture. Heavy matters are first allowed to settle. The oil is drawn off, heated to about 100° C., and treated with crystals of barium chloride. The temperature is maintained until the surface is free from scum, when the oil is filtered.

Glycerine. G. T. Lemmens, Watlington, Kent. British Patent, 126,706, of 1917.

In the production of glycerine by heating oil or fat in an autoclave at a pressure of about 100lb. per sq. in. in the presence of zinc oxide, hydroxide, etc., the operation is carried out in two stages to increase the yield of glycerine. After heating for a period such as eight hours, the strong glycerine solution is drawn off and replaced by hot distilled water, and the heating is continued for a further period such as four hours. The relatively dilute solution of glycerine from the second stage of the process may be used instead of water for the initial treatment of the next charge of oil or fat.

Treating Waste Acid. British Dyes, Ltd., J. Turner, and H. Dean, Huddersfield. British Patent, 127,039, of 1917.

Waste acid liquors or wash-waters from the manufacture of explosives, such as picric acid and other nitro-bodies, are rendered innocuous by being treated with scrap iron in pits or tanks which may be provided with agitators. The nitro-bodies are reduced to amido-bodies. Waste alkali such as lime or soda, or waste sodium or calcium sulphite, may be added and the liquid filtered.

Acid Tanks. British Dyes, Ltd., J. Turner, and J. H. West, Huddersfield. British Patent, 124,997, of 1918.

Tanks for transporting acids, etc., by road, rail, or water are formed of sections lined with ebonite, vulcanite, etc., vulcanised on, and all fittings liable to come into contact with the acid are similarly coated. The sections are connected by means of angle-irons *d*, with coated surfaces, and coated baffle-

plates *e* are provided, the joints being made tight by soft-rubber washers. A manhole cover *m* is provided with a stirrup *p* to indicate the height to which the tank is to be filled, and with a cover *o* for an inspection opening. A pipe *q* for filling and emptying depends into a sump *h*, its lower end being supported by a casting *u*, and a pipe *v* with baffles serves as a vent or for the introduction of compressed air.

Formaldehyde Manufacture. G. Calvert, Twickenham Park, Middlesex. British Patent, 126,479, of 1918.

In apparatus for producing formaldehyde, wherein the vapour of methyl alcohol is mixed with a regulated supply of air at the entrance of the tube containing the catalyst (copper, silver, etc.), the alcohol vapours are preheated by passage through a coil of piping surrounding the catalyst tube before entering the tube. Figs. 3 and 4 show a large-scale

apparatus for producing formaldehyde solution; methyl alcohol vapour from boiler 1 passes through coils 13 surrounding the catalyst tubes 7, and thence to conical nozzles 14 adjustably mounted at the ends of the tubes 7; the air enters between the nozzle and tube, and the supply is regulated by screwing up the nozzle. The catalyst consists of copper gauze packed in two portions 11, 11'. The products of combustion pass through valve boxes 20 to a receiver 24 and a cooler 25, and thence to absorption apparatus 26, similar to that described in Specification 814/15.

Sodium Nitrite Manufacture. J. Grayson, Huddersfield. British Patent, 127,183, of 1918.

Sodium nitrite is obtained by reducing nitric acid to nitric oxide by means of sulphur di-oxide, purifying the nitric oxide by washing with water and then with dilute soda, and then adding air to produce approximately N_2O_4 , and absorbing in soda solution. Nitric acid is prepared in a retort B from sulphuric acid and sodium nitrate, and sulphur dioxide in a retort A. The sulphur dioxide is led into the retort B, and the mixed gases pass through a tube C, in which sulphuric

acid condenses and is collected in a trap F and tank G, which supplies the retort B. The gas is washed by water and soda in packed towers H, K respectively, and, from the tower K, passes by a pipe k having two sight-tubes k^1, k^2 , Fig. 2, with an air inlet k^3 between them. Air is admitted in the requisite quantity, and the gas then passes to the soda absorption tower L, the exit gases escaping by a pipe l having two sight-tubes l^1, l^2 , with an air inlet l^3 between them, Fig. 1. The admission of air by the inlet k^3 is controlled by testing the gas in the pipe l . If the correct amount of air has been added, there will be a small quantity of nitric oxide in the pipe l , which will be colourless in the tube l^1 , but, on admission of a little air by l^3 , will show a slight colour in l^2 . As the absorption proceeds, more soda-ash is added to the liquor in the tower L.

Sulphuretted Dyes. Brotherton and Co., Leeds; and E. F. Ehrhardt and W. W. Kay, Mersey Chemical Works, New Ferry, Cheshire. British Patent, 127,143, of 1918.

Sulphuretted dyes are obtained by heating with sulphur and sodium sulphide mixtures of an azo dye from diazotised picramic acid and phenol or a cresol or cresols with free phenol or a cresol or cresols. According to an example, a mixture of picramic acid-azo-*m*-cresol with meta-para-cresol is used.

Chlorhydrocarbons. V. J. Harding, Montreal, Canada. British Patent, 126,511, of 1918.

Olefine dichlorides are prepared by reaction of gaseous olefines (ethylene, propylene, etc.) with chlorine in presence of a contact substance (brick, pumice, sand, glass, coke, charcoal, ferric oxide, alumina, magnesia, etc.) in the absence of water or steam.

Treating Solids with Gases. A. Rudge and United Alkali Company, Ltd., Liverpool. British Patent, 126,773, of 1918.

Apparatus for treating solids with gases in counter-current—for instance, for making chloride of lime—consists of a long cylinder 1 provided with lifters 2 in the form of bars carried on the inside of the cylinder with about an inch of clearance between, and with cooling-means which may consist of water-sprays from a pipe 18 arranged over the whole or part of the tube. The lime is fed in from a hopper 7 by a conveyer 8

on a hollow shaft 9, through which the waste gas is withdrawn by a fan 14^a, and the product is withdrawn from a hopper 15 provided with double slides 16, 17, while the gas is admitted by a pipe 21, having a flexible connection 22 upon which is a clip to constrict or cut off the gas inlet. The cylinder is rotated upon rollers 4. The whole or any part of the water spray can be cut off by valves 18^a, 18^b. Openings 19 are provided for inspection or sampling or for the reception of thermometers as at 20.

Indigo Dyes. A. M. Hart, West Hampstead, London. British Patent, 126,754, of 1918.

Indigo is sulphonated by means of concentrated sulphuric acid, the solution is mixed with alum and the mass fused. The product, cooled and ground to powder, is soluble in hot water, and dyes wool blue shades in acid baths. Cream of tartar may be added in addition to alum; the indigo sulphonic acid solution may be neutralised with soda and crystallised before fusing with alum. Products giving navy-blue shades may be obtained by mixing the above-described preparations with a soluble or sulphonated cudbear product. The soluble cudbear products referred to may be obtained (1) by boiling cudbear with methylated spirit, filtering, and evaporating the solution to dryness; (2) extracting cudbear with strong ammonia, filtering, adding soda, neutralising with sulphuric acid, and crystallising. Sulphonated cudbear is obtained by treating cudbear with dilute sulphuric acid and neutralising and crystallising the product.

Separating Dust from Gases. Huntington, Heberlein and Co., and H. J. Bush, London; and H. A. Burns, Finchley, Middlesex. British Patent, 127,119, of 1918.

In separating suspended particles from gases, such as blast-furnace gases by electrical means, such as the means described in Specification 5969/08, dust of a conducting character, such as iron oxide, is mixed with the gases in order to yield on the surface of the electrodes a conducting deposit.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Superphosphate Prices in Spain.—The Spanish Ministry of supplies has issued a decree modifying the maximum prices of superphosphate of lime. The prices per 100 kilogrammes, without packing, in minimum parcels of 10 tons, on wagon at the factories on the coast (the cost of transport to be added for interior factories), will be as follows: Superphosphate, 18-20 per cent., 25 pesetas; 16-18 per cent., 20-25 pesetas; 15-17 per cent., 19 pesetas; and 13-15 per cent., 16 pesetas. The said prices will be applicable to all purchases made by agriculturists from July 1, and will be valid until the end of December.

Sulphate of Ammonia.—Trading in sulphate of ammonia is steady at the moment, and it is clear that the material is in continued high repute in agricultural circles here. Farmers have to pay, of course, more than last season, but this does not appear to be likely to affect their purchases materially. Recurrent fears about the position of the coal market tend to complicate the sulphate situation somewhat, as in this connection there might arise a shorter supply than anticipated. On the other hand, there is an expectation of imports of sulphate of ammonia from Germany in the near future. Diverse views are expressed with regard to this. Whilst some have it that Germany cannot possibly do much in this respect for some time to come, there are other people who expect big things. Some muriate of ammonia is also reported to have been offered lately at the high price of £55. per ton. Across the Channel the French Government recently reduced their official price of sulphate of ammonia by 10 per cent., but it must be remembered that conditions in the two countries with regard either to production or distribution are very different.

Superphosphates.—There appears to be no change with regard to this material. Prices for delivery during the period ending September are likely to be higher than those ruling for the same period last year, and that is as far as forecasts go at present. Farmers who are wise are acting upon this, and are purchasing and taking delivery early. Imports of phosphate of lime and rock phosphate into this country for the six months ended June this year were 205,135 tons, against 242,939 tons in the first half of last year, and 73,953 tons in the first six months of the year before.

Bones and Bone Meals.—Imported bones generally are in very short supply, the reason still being the lack of suitable shipping space. They come over only in small quantities, and under restricted conditions. The bone meal market is firm, with a fair demand at prices already given here. Sellers regard prices as by no means high in view of all conditions; but needy buyers are still asking when further shipments are to arrive, especially out of the big surplus stocks that are known to exist in India. According to the Board of Trade returns for the six months ended June, the imports into this country of bones for manure amounted to 2,172 tons, against 1,856 tons in the corresponding six months of last year, and 2,740 tons in the corresponding period of 1917.

Blood and Tankage.—Supplies of dried blood are short, with a fairly good demand at about 25s. per unit for ammonia.

Foreign tankage is in fair demand, but business appears to be almost impossible owing to freight difficulties. Prices may be given as at 25s. per unit for ammonia and 2s. for phosphate. Meat meal is very difficult to obtain, with prices as above, but no guarantee of quick delivery. Fish meal is also in demand, but here, again, the business is limited by the supply. Prices are said to be in the region of 27s. 6d. per unit of ammonia.

Potash.—There is not a great deal of business passing in any potash descriptions, and the latest statement is to the effect that the manures are still very scarce in England.

Basic Slag.—This material remains in good request at late rates. The cheaper kinds are especially going off well, 22 per cent. material selling readily at £3. 12s. to £3. 12s. 6d.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

There is little or no change in the position of the tinplate industry. Manufacturers are declining to quote for any volume of orders, and only immediate wants are being attended to owing to the uncertainty of the fuel situation. The Americans are trying to force business at prices much below those of South Wales makers. The question of the demand for a 12½ per cent. advance was considered on Monday. The arbitrator (Mr. Marlay Samson, K.C.) will give his award at an early date. The "unofficial" ballot has been concluded, but as the proceedings were private the result is not known. It is extremely unlikely, however, that any stoppage will take place as the employees have had the position of the trade placed before them, the latest information being that a firm of English merchants has secured a contract with American makers, the plates being delivered at Liverpool at a price of 31s. per box, or about 2s. 6d. cheaper than Welsh quotations.

Supplies in the patent-fuel trade are falling short of the demands, and owing to restrictions difficulties are placed in the way of healthy expansion. The exports for the week were only moderate, the largest cargo of 2,400 tons going to Genoa from Swansea. Cardiff's foreign business went to Morlaix, Rouen, and St. Malo, whilst from Swansea shipments were sent to St. Brieux, Rouen, Dieppe, Rotterdam, and Havre. Newport makers despatched 1,800 tons to Port Said and a cargo left Port Talbot for Rouen.

The various copper works are practically inoperative owing to the scarcity of copper ore and the industrial unrest.

The coke-ovens are working well, and the production of by-products is being fairly well maintained. Sulphate of ammonia sells steadily. The position at Ebbw Vale through the damping down of the blast-furnaces is most serious, as unfortunately this procedure may affect many other industries hereabouts. There is a magnificent battery of by-product ovens, and it is feared that these may have to become inoperative. There are 150 operating and another 100 nearly completed.

A cargo of 2,494 tons of iron pyrites has arrived at Newport from Seville.

MARKET REPORTS.**LONDON METAL MARKET.**

THURSDAY.

Copper: Standard brands, £104. 10s. to £104. 15s., cash; £105. to £105. 5s., three months; electrolytic, £110. to £125. Tin: Standard, £268. to £268. 5s., cash; £266. to 266. 5s., three months; Straits, £270.; English, £263. to £265. Lead: Soft foreign, £24.; English, £25. Spelter, £41. 10s.; hard, £32. to £33. Antimony, English regulus, 90%, £40. Aluminium, £150. Nickel, £205., delivered, packages extra. Quicksilver, £23. to £23. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 30s. per unit.

TAR AND AMMONIA PRODUCTS

WEDNESDAY.

Benzole: London, 90%, 2s.; North, 1s. 10d. to 1s. 11d.; 50%, 1s. 10d.; North, 1s. 9½d., naked. Carbolic acid, crude, 60%, East and West Coast, nominally 1s. 5d. to 1s. 6d.; crystals, 30-40%, 6d. to 6½d., f.o.b. Crude tar, London, 45s. to 60s.; Midlands, 44s. to 46s.; North, 45s. per ton, ex works. Pitch, 72s. 6d. to 75s.; East Coast, 65s., f.o.b.; West Coast, 53s. to 55s., f.a.s. Solvent naphtha, naked, London, 90-100%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 90-100%, naked,

London, 2s. 1d.; North, 1s. 10d. to 1s. 11d. Crude naphtha, naked, 30%, 9d.; North, 8d. Refined naphthaline, £18. to £22.; salts, £6. to £7. Toluol, naked, London, 2s. 6d.; North, 2s. 5d. Creosote, naked, London, 6½d.; North, 5½d. to 6d.; heavy oil, 6½d. to 7d. Anthracene, 40-45%, 6d. per unit. Cresylic acid, 95%, 2s. 7d. to 2s. 8d.; 97-99%, 2s. 9d. to 2s. 10d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: Home trade, £19. 10s. per ton; basis 24½%. Nitrate of soda, £21. to £22.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

Business generally is in an unsettled condition owing to the coal advance and labour troubles, but values all round remain fairly steady, and there are no material alterations in prices to record. 70% caustic soda continues easy at £18. for resale parcels. Refined bicarbonate of soda, bags, at £7. 5s. per ton, and 58% alkali at £6. 10s. per ton. Bleaching powder quiet at £15., softwoods, on rails; and £14. for hardwoods, f.o.b. Saltcake, in bulk, firm at 60s. per ton, carriage paid. Recovered rock sulphur easier at £18. per ton, on rails. The export position of copper sulphate is

unchanged, and price remains nominal at £45., f.o.b. Chlorate of soda weak at 7d. per lb. Potash, 1s. 1d. per lb. For bichromates, makers' quotations are unchanged at 1s. 6d. and 11d. per lb. for potash and soda respectively. Commercial hypo. soda dull at £16. 10s., on rails. Phosphate of soda steady at £25. per ton. Concentrated sodium sulphate in only small request at £20. per ton. Home supplies of arsenic continue scarce and quotations higher at £46. per ton. Yellow prussiate of potash and soda are steady and unaltered at recent rates. Lead salts are firm. White acetate at £83., and brown £75. Nitrate dull at £56. per ton. Acetate of soda a turn easier at £52. per ton. Acetic acid unchanged. English brown acetate of lime well maintained at £19. per ton. American grey firm at £19., c.i.f. Miscible and solvent wood naphtha are lower at 10s. per gallon. Green copperas is meeting with more inquiry, but prices still tend downwards. Oxalic acid is moving off fairly well at 1s. 2½d. per lb.

SWANSEA MARKET REPORT.

THURSDAY.

Quotations for tinplates are irregular and only small business is being transacted around 33s. per standard box f.o.b. Copper is better sought after and prices have an upward tendency. Some sales were made at £107. per ton prompt and £107. 10s. 0d. three months. Tin shows great activity at £268. prompt and £266. three months. Lead transactions are more numerous at £24. prompt and £24. 10s. three months. Spelter is less called for at £42. 15s. 0d. f.o.b., Silver 55½d. per ounce. Nickel prices have improved, and are £205. per ton including free delivery, London or equal. Aluminium, £150. Antimony, nominal, with English 90% regulus at £40. Quicksilver, quiet at £22. 5s. per bottle. Sulphate of copper, more active at £45. per ton for home purposes, and £47. 5s. 0d. export. Sulphate of ammonia, steady: United Kingdom, fine, £19. 10s. 0d. per ton; export prices, nominal. Nitrate of soda, quiet and steady, at £21. 10s. 0d. per ton. Turpentine, held firmly at 111s. per cwt. Arsenic in better demand and prices higher; white powdered in bags, £50. per ton f.o.b. Bone meal, 14s. 3d. per cwt. Pitch, in good demand, at 51s. 6d. per ton at ship. Oxalic acid, quiet at 1s. 3d. per lb. Zinc sheets, unchanged at £65. per ton f.o.b. at New York.

TURPENTINE MARKET REPORT.

Messrs. James Watt and Son, Ltd., of 101, Leadenhall Street, London, E.C.3, report that the stocks of turpentine on July 26 were: American, 33,471 barrels, compared with 3,395 barrels at the corresponding date of 1918; French 46 barrels (15 barrels); and Spanish 224 barrels (1,717 barrels.) Deliveries during the week ended July 26 were 2,367 barrels, against 472 barrels last year, and since January 1, 39,018 barrels, compared with 11,440 barrels in 1918. The price on Saturday last was 107s. 6d. per cwt. compared with 116s. at the corresponding date of last year. September-December delivery was quoted at 110s. and January-April (1920) 116s. 6s.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

Business in chemicals has kept up remarkably well in view of the interruptions of ship and railway transportation and of production in industries outside the Liverpool area. Inquiries on home-trade account have come in rather numerous, and on export account a very fair number have been received. Bleaching powder has been quiet. Prices are £14. 10s. to £15. per ton, free on rail or conveyance in buyers' packages, and £17. per ton for export. Chloride of calcium has been more in request, and is £8. to £11. per ton, in casks, f.o.r. Caustic soda has been well inquired for, and is £24. per ton for 76%, £22. per ton for 70 to 72%, and £19. per ton for 60 to 62%. Nitrate of soda has sold a little more freely, and is £20. 10s. to £21. 10s. per ton. Saltcake continues to meet with a fair inquiry, and is £6. 10s. per ton, in casks, f.o.b. Soda crystals have had a fairly active inquiry, and are £5. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has been in good request, and is £7. 5s. to £10. per ton, according to terms of delivery. Borax has been well inquired for, and is scarce. It is £42. per ton for ordinary, and £44. per ton for powdered, in bags. Ammonia alkali has sold rather freely, and is £6. to £6. 5s. per ton, f.o.r. at works. Hyposulphite of soda has been more in request, and is £19. to £20. per ton for ordinary crystals, in

2cwt. bags, and £25. per ton for pea crystals, in 1cwt. kegs. Sulphite has been in moderate request, and is £11. per ton for ordinary, and £18. to £19. per ton for pea crystals, in 1cwt. kegs. Bichromate of soda has been in fair inquiry, and is 9d. per lb. Phosphate of soda continues quiet, and is £25. per ton. Sulphide of sodium has been in quietly steady demand, and is £20. per ton, in casks, and £22. per ton, in drums. Chlorate of potash has been quiet, and is 1s. 1d. to 1s. 3d. per lb. Permanganate of potash has been rather more inquired for, and is 3s. 6d. per lb. Sulphate of potash has been inactive, and is £40. per ton. Carbonate of potash has again met with a very fair inquiry, and is £85. to £90. per ton for 80 to 85%. Caustic potash has been more in request, and is £90. to £100. per ton for 35° Bé. Nitrate of potash has been in very fair demand, and is £50. to £58. per ton for refined, and £40. per ton for ordinary. Canadian ashes have had a very limited sale, and are £200. to £220. per ton for first quality Montreal, and £190. to £210. per ton for second quality. Bichromate of potash has been in moderate request, and is 1s. 6d. to 1s. 7d. per lb. Yellow prussiate of potash has been quiet, and is 1s. 9d. to 1s. 10d. per lb. Sal ammoniac has been rather more in demand, and is £80. per ton for lump, £75. per ton for seconds, and £5. per ton extra for ground. Sulphate of ammonia has been in quietly steady request, and is £19. 10s. per ton, less traders' discount of 10s. per ton, free to nearest wharf or railway station, to September 30. Carbonate of ammonia has been in very fair inquiry, and is 6½d. per lb. Muriate has been but little called for, and is £50. to £60. per ton, according to quality. Magnesia has been rather more inquired for. Carbonate is £3. 10s. per ton, and sulphate £10. to £16. per ton, according to grade. Alum has been more in demand, and is £18. 10s. per ton for the home trade, and £18. 10s. to £19. 10s. per ton for export. Aluminoferric has been very quiet, and is £8. 10s. to £12. per ton according to quality. Sulphate of alumina has been but little in request, and is £12. to £18. per ton according to grade. Sulphur has been more in demand, and in very light supply. English kinds are: Flowers, £32. per ton; roll, £28. per ton; and rock, £22. per ton, in bags, f.o.r. Sicilian grades are: Flowers, £28. per ton; roll, £22. 10s. per ton; and third quality, £17. 15s. per ton. Cream of tartar has been more in demand, and is £11. 5s. to £11. 10s. per cwt. Tartaric acid has had a quietly steady sale, and is 3s. 1d. per lb. Boracic acid has been in good request, and is £72. per ton for crystals, and £74. per ton for powdered. Oxalic acid has again been quiet, and is 1s. 3d. per lb. White acetate of lead has had but a limited inquiry, and is £85. to £90. per ton. Arsenic has been more in request, and the price still keeps high. It may be given as from £45. to £50. per ton for white powdered. Sulphate of copper has received but little attention on home-trade account, but has been in moderate demand for export. For farm purposes in the United Kingdom it is £45. per ton, and for export £47. to £48. per ton, less 5%, in casks, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.

TUESDAY.

There is little change to report in the chemical market; the demand continues steady. Bleaching powder and caustic soda are in good demand, while sulphur continues scarce and firm.

The following prices are per ton, net: Bleaching powder, softs and hards, £15.; caustic soda, 74/77%, £23. 5s.; do., 70%, £22.; do., 60%, £20.; recovered sulphur, 2 cwt. bags, £23.; hyposulphite of soda, 5/7cwt. casks, £19.; do., 1cwt. kegs, £25.; sulphite of soda, 5/7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75° Tw., £9. 12s. 6d.; do., 100° Tw., £10.; do., 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5.; sulphate of soda (salt cake), £3. 10s.; pure white sulphate of alumina, 14/15%, £19. 10s.; blanc fixe, £22.; chloride of barium, £27.; sulphide of sodium, crystals, £18.; do., refined concentrated solid, 60/62%, £25.; hydrate of barium, crystals, £56.

COALS.—There is no improvement in the position of affairs in the coal market, and the uncertainty as to the course the Yorkshire miners will take is accentuating the difficulties of the position. It is clear that the Americans are making huge efforts to capture the export trade of this country—and the increased production at the German mines is having its effect also. Quotations for the neutral markets are about as follows: Best Northumberland steam, 85s. to 90s. per ton; best Northumberland smalls, 45s. per ton; best Durham gas coal, 70s. to 72s. 6d.; seconds, do., 67s. 6d. to 70s.; bunkers, 60s.; foundry coke, 70s. to 75s.; gas coke, 78s. 6d.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

Business is still to the slow side in the local chemical trade. During the past week many firms have really only been marking time until the more general resumption, and in consequence dealings have generally been small and unimportant. Prices remain more or less on the old footing, and may still be quoted as follows:—arsenic, £40. per ton, net, Glasgow; bicarbonate of soda, £8. 15s. and £10. per ton for 6-8 casks and 1cwt. kegs, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags, and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £24. per ton, net, Glasgow; chlorate of potash, 1s. 3d. per lb., net, Glasgow;

chlorate of soda, 10d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 88%, £11. 5s. per cwt., net, Glasgow; salammmoniac, £80. and £75. per ton, net, any port, for first and second lump respectively; salammmoniac crystals £85. per ton, net, Glasgow; saltpetre, £3. 5s. per cwt., net, Glasgow; tartaric acid, 3s. 1d. per lb., 5%, Glasgow.

In the sea oil section the conditions are also unsettled with the prevailing holiday feeling in the air, and business during the past week has been of small compass. Whale oil is still coming on the market at about 80s. for brown, and 78s. for black, and most orders are put through close on these figures. Newfoundland cod has not had many important dealings, and the price is still at the old level of 75s.; while the market continues without either pale seal or Menhaden.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

BRISTOL.

Publication of Official Returns Suspended.

GLASGOW.

Week ending July 26.

ACETONE—
Baltimore, 154 drms.
DEXTRINE—
New York, 4,839 bgs.
DYESTUFFS—
Cutch
Rangoon, 1,100 bxs.
FISH OIL—
Philadelphia, 300 brls.

Harcourt, 260 bxs.; Pt. Louis, 12 pkgs.; Piraeus, 14 bxs.; Pt. Said, 2,750 bxs.; Pt. Stanley, 4 pkgs.; Pt. Sudan, 2,255 pkgs.; Rangoon, 3,648 bxs.; Quittah, 3 pkgs.; St. John's N.F., 228 bxs.; Samarang, 100 bxs.; Sao Paulo, 2 cs.; Seconde, 125 bxs.; Shanghai, 4,500 bxs.; Singapore, 2,320 bxs.; Smyrna, 20 cs.; Soerabaya, 550 cs.; Sydney, 2 bxs.; Tientsin, 167 cs.; Timoe, Tilly, 100 cs.; Tripoli, 2 cs.; Tuticorin, 45 cs.; Warri, 36 bxs.; Wellington, 110 bxs.

SODA ASH—

Algoa Bay, 40 pkgs.; Amsterdam, 2,000 pkgs.; Bombay, 40 pkgs.; Calcutta, 10,351 pkgs.; Catania, 100 pkgs.; Dalny, 4,032 pkgs.; Durban, 10 pkgs.; Fremantle, 2,320 pkgs.; Karachi, 1,750 pkgs.; Kobe, 18,862 pkgs.; Leghorn, 200 pkgs.; Maranhham, 1,201 pkgs.; Naples, 200 bgs.; New Orleans, 2,000 bgs.; Oporto, 73 cks.; Penang, 30 pkgs.; Piraeus, 450 pkgs.; Skein, 18,906 bgs.; Tientsin, 9,800 bgs.; Volo, 100 pkgs.; Wellington, 398 pkgs.

SODA CRYSTALS—

Alexandria, 150 pkgs.; Bangkok, 67 brls.; Pt. Said, 100 pkgs.

SODIUM BICARBONATE—

Amsterdam, 60 pkgs.; Bagdad, 25 brls.; Bangkok, 40 pkgs.; Calcutta, 2,000 pkgs.; Catania, 30 pkgs.; Ceara, 20 pkgs.; East London, 30 pkgs.; Genoa, 225 pkgs.; Galatz, 40 pkgs.; Hong Kong, 302 pkgs.; Karachi, 1,215 pkgs.; Kingston, Ja., 20 pkgs.; Kobe, 1,077 pkgs.; Lisbon, 100 pkgs.; Moji, 215 pkgs.; Montreal, 150 pkgs.; Naples, 250 kgs.; Rangoon, 1,134 kgs.; Salonika, 20 kgs.; Soerabaya, 150 kgs.; Yokohama, 1,077 pkgs.

SODIUM CYANIDE—

Batavia, 15 cs.

SODIUM SILICATE—

Adelaide, 229 pkgs.; Auckland, 10 pkgs.; Algoa Bay, 140 pkgs.; Boston, 20 cks.; Buenos Ayres, 671 pkgs.; Dundee, 27 pkgs.; Genoa, 1,300 pkgs.; Leghorn, 33 pkgs.; Madras, 30 pkgs.; Maranhham, 50 pkgs.; Melbourne, 343 pkgs.; Natal, 16 pkgs.; Piraeus, 300 pkgs.; Shanghai, 384 pkgs.

SULPHUR—

Black River, 2 c., £11.; Dundee, 5 t. 2 c., £141.; Hong Kong, 3 t., £120.; Lagos, 5 t., £160.; Monrovia, 2 c., £5.; Pernambuco, 1 t. 19 c., £54.; Quittah, 3 c., £7.

SUPERPHOSPHATE (otherwise undescribed)—

Teneriffe, 68 t.

SUPERPHOSPHATE OF LIME—

Orotava, 10 t.

STEARINE—

La Libertad, 10 bgs.

TALLOW—

Marseilles, 465 pkgs.

TARTARIC ACID—

New York, 2 t., £638.

WOOD PRESERVATIVE—

Burutu, 1 t. 10 c., £7.; Cape Town, 1 t. 18 c., £65.; Grand Bassam, 1 c., £3.; Lome, 4 c., £7.; Monte Video, 6 t. 16 c., £183.; Pt. Gentil, 10 c., £20.; Tloilo, 3 c., £4.

ZINC CHLORIDE—

Alexandria, 3 t., £255.; Bombay, 3 t. 18 c., £235.

ZINC SULPHATE—

Bombay, 1 t., £23.

LONDON.

Week ending July 23.

ACETANILID—

Havre, 11 cks., £280.

ACETIC ACID—

Alexandria, 6 cs., £26.; Antwerp 3 brls., £51.; Auckland, 1 cs., £6.; Canton, 1 cs., 21 cs. (pt.), £29.; Christchurch, 25 cs., £74.; Jaffa, 1 cs., £5.; Lyttleton, 8 cs., £24.; Rio de Janeiro, 3 cs., £7.; Wellington, 1 kg., £8.

ACETO SALICYLIC ACID—

Athens (F.), 1 cs. (pt.), £8.; Penang, 1 cs. (pt.), £6.

ACETONE—

Rangoon, 2 drms., £21.

ALUM—

Cape Town, 5 c., £7.; Durban, 10 c., £11.; Rio de Janeiro, 6 c., £14.

AMMONIA—

Alexandria, 8 cs., £45.; Antwerp, 2 drms., £26.; Buenos Ayres, 15 drms., £192.; Canton, 1 cs. (pt.), £8.; Durban, 20 cs., £40.; Madras, 2 cs., £7.; Mombasa, 3 cs., £6.; Paris, 39 drms., £355.; Pt. Elizabeth, 6 cs., £23.; Rio de Janeiro, 10 cs., £48.; Soerabaya, 8 cs., £21.; Tokio, 4 cs., £15.; Wellington, 19 cs. (pt.), £14.

AMMONIUM BROMIDE—

Antwerp, 3 cs., £116.

AMMONIUM CARBONATE—

Calcutta, 4 c., £19.; Callao, 10 c., £50.; Hong Kong, 5 c., £22.; Mauritius, 2 c., £6.; Porto Alegre, 10 c., £90.; Rio de Janeiro, 3 t. 18 c., £389.; Santos, 17 c., £86.; Sao Paulo, 4 t. 4 c., £433.

AMMONIUM CHLORIDE—

Canton, 3 cs., £18.; Hong Kong, 1 ck., £6.

AMMONIUM MURIATE—

Athens, 2 c., £7.; Brussels, 1 t. 4 c., £60.; Bombay, 5 t. 2 c., £369.; Buenos Ayres, 1 t. 10 c., £106.; Hobart, 3 c., £18.; Rosario, 1 t. 1 c., £72.; Shanghai, 4 c., £18.

AMYL ACETATE—

Barcelona, 1 drms., £55.; Kobe, 10 drms., £110.

ANTIMONY REGULUS—

Amsterdam, 5 t.

ANTIMONY SULPHATE—

Abo, 1 ck., £56.; Buenos Ayres, 3 cs., £68.; Bordeaux, 4 cks., £223.; New York, 20 cks., £428.; Rotterdam, 12 cks., £400.; Trelleborg, 1 ck., £25.

ANTIMONY SULPHIDE—

Brussels, 2 cks., £24.

ANTIMONY TARTRATE—

Brussels, 2 cs., £33.; Sao Paulo, 1 cs. (pt.), £14.

ARSENIC—

Buenos Ayres, 20 t. 1 c., £700.; Calcutta, 6 t., £528.; Lisbon, 6 c., £15.; Valencia, 1 t. 4 c., £35.

BEES WAX—

Amsterdam, 1 t.

BENZOIC ACID—

Paris, 1 ck., £35.; Rangoon, 1 cs. (pt.), £7.

BISMUTH CARBONATE—

Corral, 1 cs. (pt.), £23.; Durban, 1 cs. (pt.), £22.; Hong Kong, 1 cs. (pt.), £22.; Stockholm, 1 cs. (pt.), £9.

BISMUTH CITRATE—

Durban, 1 cs. (pt.), £11.

BISMUTH METAL—

Osaka, 3 t.

BISMUTH SALICYLATE—

Corral, 1 cs. (pt.), £23.

BISMUTH SUBGALLATE—

Athens, 1 cs. (pt.), £20.; Alexandria, 1 cs. (pt.), £9.

BISMUTH SUBNITRATE—

Athens, 1 cs. (pt.), £18.; Alexandria, 1 cs. (pt.), £8.; Calcutta, 1 cs. (pt.), 1 cs., £10.

BISMUTH SUBNITRATE—

Corral, 1 cs. (pt.), £23.; Durban, 1 cs. (pt.), £5.; Sao Paulo, 1 cs., £8.; Stockholm, 1 cs. (pt.), £118.

BISMUTH SUBSALICYLATE—

Stockholm, 1 cs. (pt.), £77.

BORAX—

Antwerp, 59 t. 9 c., £1,911.; Hobart, 2 c., £5.; Hong Kong, 10 c., £25.; Kobe, 5 c., £10.; Madras, 12 c., £66.

BORIC ACID—

Calcutta, 12 c., £48.; Canton, 3 c., £14.; Colombo, 1 c., £5.; Mossel Bay, 10 c. (F.), £37.; Shanghai, 15 t., £1,110.; Smyrna 2 c., £11.

CABLE WAX—

Antwerp, 10 c.

CALCIUM CARBIDE

Batoum, 5 t. 18 c., £147.; Galatz, 10 c., £12.

CALCIUM CARBONATE—

Buenos Ayres, 2 cks., £11.

CALCIUM CHLORATE—

Brussels, 2 cs., £5.; Singapore, 1 c., £5.; Sydney, 1 t. 7 c., £54.

CALCIUM GLYCEROPHOSPHATE

Valparaiso, 1 cs. (pt.), £8.

CALCIUM IODIDE—

Stockholm, 4 cs., £375.

CALCIUM LACTATE—

Alexandria, 1 cs. (pt.), £6.

CARBON (RETORT)

Hoganas, 162 t., £1,020.

CARNAUBA WAX—

Italy, 1 t.

CAUSTIC SODA—

Galatz, 9 t. 18 c., £365.; Larache, 10 c., £12.; Penang, 13 c., £30.; Sydney, 18 c., £47.

CERESINE WAX—

Antwerp, 3 t. 4 c.

CHEMICALS (otherwise undescribed)

Alexandria, 3 cs. (pt.), £24.; Beyrout, 1 cs., £7.; Bombay, 12 cs., £147.; Buenos Ayres, 16 pks., £136.; Calcutta, 6 cs., £26.; Colombo, 4 cs., £62.; Durban, 2 cs., £45.; Durban, 20 pks. (F.), £110.; Foochow, 2 cs., £19.; Jaffa, 3 cs., £6.; Kilindini, 1 cs., £8.; Malta, 3 cs., £30.; Montreal, 2 cs., £71.; New York, 2 cs., £350.; Paris, 1 cs., £7.; Pt. Swettenham, 1 cs., £7.; Shanghai, 2 pks., £83.; Singapore, 2 cs., £27.; Smyrna, 5 kgs., £7.; Sydney, 3 cs. (pt.), £87.

CHINA CLAY—

Buenos Ayres, 10 t.

CINNAMIC ACID—

Paris, 1 cs., £30.

CITRIC ACID—

Alexandria, 2 c., £39.; Antwerp, 10 c. (F.), £236.; Amsterdam, 10 c. (F.), £230.; Barbados, 1 c., £25.; Beira, 2 c., £48.; Calcutta, 2 c., £50.; Cape Town, 1 cs., £11.; East London, 1 cs. (pt.), £9.; Pt. Elizabeth, 1 c., £31.

COAL PRODUCTS—

Aniline Colour
Singapore, 1 cs., £20.

Aniline Dye

Buenos Ayres, 1 cs., £86.; Genoa, 9 pks., £675.; Lisbon, 1 cs., £40.; Paris, 1 ck., £27.; Toronto, 1 ck., £50.

Benzonate

Beira, 50 drms., £100.

Benzonaphthol

Athens (F.), 1 cs. (pt.), £18.; Corral, 1 cs. (pt.), £23.

Carbolic Acid

Calcutta, 5 cs. (pt.), £27.; Kobe, 79 drms., £170.; Osaka, 131 drms., £340.; Sydney, 100 drms., £98.; Wei-Hai-Wei, 9 pks., £9.; Yokohama, 317 cks., £5,000.

Croosote

Buenos Ayres, 22 drms., £254.; Dordrecht, 18,804 gals., £505.; Canton, 1 ck., £6.; Paris, 120 cks., £397.; Shanghai, 26 pks., 10 cks., £104.; Singapore, 2 cks., £11.; Sourabaya, 50 drms., £150.; Trelleborg, 100 cks., £180.

COAL PRODUCTS—

Cresylic Acid
Casablanca, 20 brls., £124.

Mineral Black

Trinidad, 5 cks., £10.

Naphthalene

Alexandria, 2 pks., £9.; Colombo, 10 drms., £21.; Constantinople, 2 cks., £18.; Jaffa, 1 kg., £11.; Madras, 6 cs., £19.; Malta, 5 drms., £25.; Montreal, 25 cks., £85.; New York, 136 cks., £225.; Wellington, 10 drms., £15.

Pitch

Antwerp, 345 t., £1,207.

Tar

Santa Cruz (Arg.), 50 drms., £24.; Trelleborg, 300 cks., £170.

Tar Oil

Havre, 100 cks., £156.

Trioxymethylene

Brussels, 1 cs., £36.

Xylol

Paris, 3 drms., £39.

COPPER SALTS—

Dunedin, 1 dr., £15.

COPPER SUBOXIDE—

Rotterdam, 1 ck., £50.

COPPER SULPHATE—

Channel Islands, 37 bgs., £88.; Mossamedes, 9 c., £21.

CREAM OF TARTAR—

Amsterdam, 1 c., £20.; Broome, 2 c. (F.), £31.; Calcutta, 1 c., £21.; East London, 1 cs. (pt.) (F.), £14.; East London, 2 c., £31.; Hong Kong, 1 c. (F.), £31.; Limon, 2 c., £56.; Madras, 1 c. (F.), £10.; Osaka, 2 t., £500.; Pt. Elizabeth, 1 c. (F.), £12.; Shanghai, 3 cs. (F.), £13.; St. John, N.B., (transit), 1 t 6 c. (F.), £200.

DISINFECTANTS (otherwise notes.)

Alexandria, 1 c., £6.; Beira, 14 c., £47.; Bombay, 13 t. 6 c., £575.; Cape Town, 3 c., £17.; Cocos, 2 c., £5.; Colombo, 5 t. 12 c., £255.; Danzig, 5 t., £374.; Durban, 2 c., £15.; Hankow, 3 c., £8.; Hong Kong, 5 t., £287.; Jaffa, 1 c., £8.; Karachi, 4 t. 9 c., £192.; Kilindini, 1 t. 2 c., £54.; Madras, 3 t. 1 c., £26.; Monte Video, 1 t. 10 c., £95.; Paris, 4 t. 12 c., £120.; Paris, 1 t. (F.), £120.; Pt. Elizabeth, 5 c., £10.; Singapore, 2 t. 5 c., £73.; Zanzibar, 6 c., £16.

ETHER—

Alexandria, 1 cs. (pt.), £7.; Constantinople, 1 cs., £10.; Jaffa, 1 cs., £20.; Malta, 2 cs., £17.; Pt. Swettenham, 1 cs. (pt.), £7.

ETHER (ACETIC)—

Madras, 1 cs., £7.

ETHER (ANHYDROUS)—

Dunedin, 1 cs., £75.

ETHYL CHLORIDE—

Durban, 1 cs., £7.; Wellington, 8 cs. (pt.), £6.

FATTY ACIDS—

Bordeaux, 11 t.; Galatz, £850.; Nantes, £1,300.; Rotterdam, 15 t. 2 c.; Rouen, 9 t. 19 c.

FULLER'S EARTH—

Buenos Ayres, 46 t.

GALLIC ACID—

Brussels, 1 kg., £20.

GELATINE—

Shanghai, 10 c.

GLUE—

Kobe, 25 t.; Yokohama, 17 t. 10 c.

GLUE, SIZE, AND GELATINE—

Antwerp, 7 t. 12 c.; Auckland, 5 c.; Beira, 4 c.; Bilbao, 2 t. 10 c.; Bombay, 2 t. 13 c.; Bordeaux, 10 c.; Bundaberg, 1 c.; Calcutta, 2 c.; Christiania, 2 c.; Cape Town, 12 c.; Cologne, 17 t. 11 c.; Colombo, 1 t.; Dieppe, 1 t. 5 c.; Durban, 3 c.; Helsingfors, 5 t.; Lytleton, 1 c.; Lima, 10 c.; Melbourne, 6 c.; Montreal, 2 t.; Ostend, 1 c.; Singapore, 10 c.; Sydney, 1 c.; Wellington, 3 c.

GLYCERINE—

Alexandria, 12 c., £90.; Beira, 2 c., £12.; Calcutta, 1 c., £8.; Durban, 10 c., £61.; Hankow, 1 c., £10.; Hong Kong, 1 t., £126.; Kobe, 1 c., £79.; Malta, 1 c., £7.; New York (crude), 26 t. 18 c., £1,782.; Osaka, 4 c., £80.; Paris, 7 t. 5 c., £1,000.; Piraeus, 2 c., £13.; Rio de Janeiro, 8 c., £58.; Rouen, 1 t., £130.; Soerabaya, 12 c., £82.

GLYCEROPHOSPHATE OF LIME—

Athens (F.), 1 cs. (pt.), £13.

HYDROBROMIC ACID—

Wellington, 5 c., £24.

HYDROCHLORIC ACID—

Brussels, 2 t., £31.; Buenos Ayres, 2 c., £3.; Colombo, 2 c., £6.; Jaffa, 4 c., £15.; Rio de Janeiro, 3 c., £32.; Wellington, 12 c., £52.

HYDROCYANIC ACID—

Durban, 1 cs. (pt.), £5.

HYDROGEN PEROXIDE—

Alexandria, 18 pks. (pt.), 2 cs. (pt.), £46.; Cape Town, 1 cs., £12.; Cyprus, 2 cs., £9.; Durban, 1 cs., £6.; Paris, 5 cks., £40.

IODINE—

Genoa (F.), 7 cks., £3,600.; Shanghai, 1 cs. (pt.), £16.

IODINE (DISUBLIMED)—

Alexandria, 1 cs. (pt.), £10.; Genoa, 2 cs., £180.

IRON AND AMMONIUM CITRATE

Amsterdam (pt.), 1 cs., £26.; Brussels, 1 cs. (pt.), £9.; Buenos Ayres, 1 ck., £18.

IRON PERCHLORIDE—

Paris, 5 cks., £37.; Sydney, 19 cks., £100.

LACTIC ACID—

Alexandria, 1 cs. (pt.), £5.; Athens (F.), 1 cs., £18.; Paris, 10 cks., £145.

LEAD ACETATE—

Canton, 1 cs., £6.; Rio de Janeiro 1 cs., £13.

LEAD IODIDE—

Brussels, 1 cs., £37.

LITHIUM CITRATE—

Antwerp, 2 cs. (pt.), £6.

MAGNESIA (CALCINED)—

Bahia, 1 cs., £20.; Buenos Ayres, 1 cs., £30.; Callao, 1 cs. (pt.), £6.; Rio de Janeiro, 3 cs., £79.; Sao Paulo, 4 cs., £63.

MAGNESIUM CARBONATE—

Athens, 4 bgs., £15.; Boulogne, 40 bgs., £115.; Bahia, 2 bgs., £18.; Lytleton, 2 bgs., £9.; Maryborough, 1 cs., £6.; Rio de Janeiro, 27 cs., £235.; Sao Paulo, 4 cs., £63.

MAGNESIUM CITRATE—

Alexandria, 1 cs. (pt.), £11.; Barcelona, 10 cs., £69.; Monte Video, 5 cs., £23.

MAGNESIUM SULPHATE—

Casablanca, 4 c., £7.; East London, 10 c., £21.; Karachi, 4 c., £7.; Paris, 1 t., £48.; Pt. Elizabeth, 3 c., £7.; Porto Alegre, 14 c., £38.; Rio de Janeiro, 5 c., £7.; Rockhampton 1 t. 2 c., £45.; Townsville, 5 c., £10.

MANGANESE HYDRATE—

Rotterdam, 3 cks., £50.

MERCURY BICHLORIDE—

Amsterdam, 1 cs. (pt.), £17.

MERCURY CHLORIDE—

Amsterdam, 1 cs. (pt.), £7.

MERCURY OXIDATE—

Rotterdam, 2 cs., £106.

MERCURY OXIDE—

Sao Paulo, 1 cs. (pt.), £29.

MERCURY PERCHLORIDE—

Shanghai, 3 pks. (pt.), £7.

MERCURY PERSULPHATE—

Monte Video, 1 cs. (pt.), £3.

MERCURY SUBCHLORIDE—

Shanghai, 3 pks. (pt.), £7.

METHYL SALICYLATE—

Athens, 2 cs., £22.; Naples, 1 cs., £8.

MURIATIC ACID—

Rio de Janeiro, 3 c., £32.

NICKEL SALTS—

Rotterdam, 73 cks., £840.; Sydney, 10 cs., £28.

NITRIC ACID—

Auckland, 2 c., £9.; Colombo, 2 c., £7.; Ghent, 3 t. 15 c., £156.; Jaffa, 1 c., £8.; Rio de Janeiro, 6 c., £70.; Wellington, 7 c., £40.

NUCLEIC ACID—

Paris, 1 cs., £225.

OXALIC ACID—

Antwerp, 4 cks., £175.; Bordeaux (F.), 4 cks., £145.; Lisbon, 3 cks., £138.

PARAFFIN WAX—

Genoa, 19 c.

PERCHLORIC ACID—

Calcutta, 1 cs., £3.

PHOSPHORIC ACID—

Auckland, 8 cs., £45.; Durban, 13 pks., £33.; Genoa, 6 crbys., £92.; Paris, 2 cs., £18.; Wellington, 3 cs., £23.

PHOSPHORUS—

Auckland, 30 cs., £346.; Dunedin 30 cs., £346.; Lytleton, 20 cs., £225.; Otago, 15 cs., £200.; Wellington, 28 cs., £308.

PHOSPHORUS (AMORPHOUS)—

Bombay, 2 cs., £30.; Trinidad, 4 cs., £53.

PLUMBAGO—

Antwerp, 18 c.; Bangkok, 1 t.

POTASSIUM BICARBONATE—

Alexandria, 1 cs. (pt.), £6.; Brussels, 2 pks. (pt.), £17.

POTASSIUM BICHOIMATE—

Athens, 1 kg., £8.; Buenos Ayres, 2 cs., £26.

POTASSIUM BROMIDE—

Athens (F.), 1 cs. (pt.), £7.; Durban, 1 cs. (pt.), £15.; Sao Paulo, 2 cs. (pt.), £21.

POTASSIUM CARBONATE—

Alexandria, 2 cs. (pt.), £24.; Hong Kong, 1 cs. (pt.), £5.

POTASSIUM CHLORATE—

Auckland (F.), 12 c., £121.; Athens, 1 c., £21.; East London, 1 c., £8.; Hong Kong, 1 c., £11.; Wellington, 1 c., £15.

POTASSIUM CHLORIDE—

Sydney (F.), 2 c., £19.; Wellington, 8 cs. (pt.), £7.

POTASSIUM CITRATE—

Hong Kong, 1 cs. (pt.), £6.

POTASSIUM CYANIDE—

Brussels, 6 c., £67.; Buenos Ayres, 2 kgs., £76.; Dunedin, 1 dr., £14.; Melbourne, 1 cs. (pt.), £8.; Singapore, 5 cs., £43.

POTASSIUM FERRICYANIDE—

Rangoon, 1 cs. (pt.), £22.

POTASSIUM HYPOPHOSPHITE—

Osaka, 10 cs., £366.

POTASSIUM IODIDE—

Alexandria, 2 cs. (pt.), £22.; Bangkok, 2 cs., £125.; Calcutta, 2 cs., £120.; Leghorn, 6 cs., £460.; Perth, 1 cs., £80.; Shanghai, 1 cs., £78.

POTASSIUM METABISULPHATE

Caen, 2 kgs., £10.; Durban, 1 kg., £7.; Genoa, 5 brls., £110.; New Plymouth, 5 brls., £65.

POTASSIUM PRUSSATE—

Athens, 1 kg., £22.; Buenos Ayres, 3 pks., £64.; Lisbon, (F.), 1 ck., £69.

POTASSIUM SULPHATE—

Abo, 1 ck., £16.

POTASSIUM SULPHIDE—

Corral, 2 cs., £40.; Rio de Janeiro, 1 cs. (pt.), £5.; Talcahuano, 2 cs. (pt.), £30.

PYROGALLIC ACID—

Shanghai, 3 cs., £53.

QUININE—

Calcutta, 13,100 ozs.; Cape Town, 33 ozs.

SALAMMONIAC—

Singapore, 2 c., £8.

SALICYLIC ACID—

Amsterdam, 2 cks., £80.; Bordeaux, 5 cks., £210.; Hong Kong, 2 kgs., £11.; Paris, 6 cs., £66.

SALT—

Dunedin, 2 t.; Pt. Elizabeth, 1 t.; Rockhampton, 3 t.; Wellington, 1 t. 11 c.; Zanzibar, 11 c.

SALTCAKE—

Ghent, 235 t., £799.

SALTPETRE—

Auckland, 5 c., £14.; Bahia, 3 t. 19 c., £234.; Beira, 17 t., £620.; Bilbao, 2 t. 1 c., £120.; Delagoa Bay, 1 t. 5 c., £86.; East London, 12 c., £30.; Rio de Janeiro, 6 t. 17 c., £410.; Singapore, 2 c., £7.; Santiago (Spain), 1 t. 9 c., £83.; Vigo, 15 c., £42.; Wellington, 6 c., £20.

SHEEP DIP—

Buenos Ayres, 35 t. 18 c., £1,950.; Santa Cruz (Arg.), 10 t. 18 c., £940.

SILVER NITRATE—

Antwerp, 2 cs., £1,064.; Madras, 1 cs. (pt.), £23.

SILVER NUCLEINATE—

Athens (F.), 1 cs. (pt.), £6.

SOAP—

Aden, 3 c.; Adelaide, 1 c.; Alexandria, 8 c.; Amsterdam, 2 t. 19 c.; Antwerp, 385 t. 15 c.; Auckland, 2 c.; Bandoeng, 1 c.; Bangkok, 10 c.; Batavia, 11 c.; Barbados, 1 t. 1 c.; Beira, 3 t. 1 c., 48 lbs.; Bilbao, 2 c.; Bombay, 2 t. 10 c.; Bordeaux, 15 c.; Boulogne, 74 t. 9 c.; Boston, 2 t. 7 c.; Brisbane, 4 c.; Buenos Ayres, 1 t. 2 c.; Calcutta, 3 t. 14 c.; Canary Islands, 2 c.; Calicut, 12 c.; Cape Town, 9 c.; Casablanca, 7 c.; Christchurch, 5 c.; Colombo, 2 t. 9 c.; Cologne, 15 t. 1 c.; Constantinople, 1 c.; Copenhagen, 2 t. 10 c.; Durban, 13 c.; Dunkirk, 26 t. 5 c.; East London, 6 c.; Gibraltar, 13 c.; Havre, 84 t. 8 c.; Hobart, 4 c.; Hong Kong, 1 t. 10 c.; Italy, 5 c.; Karachi, 7 c.; Kobe, 1 c.; Lisbon, 6 c.; Malmo, 11 t. 18 c.; Madras, 1 t. 5 c.; Mazagan, 25 t. 14 c.; Mauritius, 1 t.; Medan, 2 c.; Melbourne, 12 c.; Mombasa, 1 c.; Monte Video, 8 c.; Napier, 2 c.; New York, 4 c.; Nevis, 1 c.; New Plymouth, 3 c.; Ostend, 3 t. 14 c.; Paris, 156 t. 9 c.; Penang, 4 c.; Perth, 10 c.; Piraeus, 6 c.; Pt. NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ...	10s. 6d.	13s.
Quarterly (18 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3960, Central.

Our Manchester Address is Barton House, 66, Deansgate.

NEW ARRANGEMENTS.

The "Chemical Trade Journal" will be published in future a day earlier.

SUBSCRIBERS to whom the Journal is posted direct will therefore receive it each week on Friday.

THE TRADE will in future be able to secure their supplies from our London office, 265, Strand. at 10 a.m. on Fridays.

EDITORIAL NOTICES.

INDEX.

Copies of the Index to Volume LXIV. (January-June, 1919) of the "Chemical Trade Journal and Chemical Engineer," which is now available, will be forwarded to those readers who make early application to the Publishers.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than Wednesday morning.

CURRENT TOPICS.

PSYCHOLOGY OF PRODUCTION.

IT is remarkable how little is heard outside a certain more or less circumscribed area of the work that is being done by our new school of psychological experts in applying the ancient science of psychology to the many problems presented by industry. Hitherto, of course, the study of psychology has largely been the prerogative of medical men, but attempts are now being made to establish industrial psychology as an experimental science, and with it the introduction of the professional psychologist. Indeed, we may say that this has now been accomplished. The fact that so much work had been and is being done to develop a definite status for industrial psychology renders it all the more surprising how little industrial circles really seem to know of what is going on. For instance, how many are familiar with the existence of psychological laboratories at Cambridge, Manchester, and elsewhere, or of the Industrial Section of the British Psychological Society, which was brought into being some time ago with an unobtrusiveness suggestive almost of nervousness? In the same way, how little attention was paid to the series of lectures given at the Imperial College of Science and Technology recently by Dr. Charles S. Myers, F.R.S., the director of the Cambridge Laboratory; yet employers of labour should be vitally interested in them, having regard to the need for applying every possible method to increasing production, and, as it has been shown already can be done, decreasing the fatigue of the worker simultaneously. The wider study of industrial psychology which is now being undertaken in this country can in a way be dated back to the time when Taylor, from America, expounded to a meeting of the Institution of Mechanical Engineers at Cambridge a year or two before the war the now familiar case of the application of the principles of motion study

to bricklaying, whereby through the elimination of various unnecessary actions on the part of the man engaged in the work, such as placing the bricks by his side at a suitable level, and so on, the number of bricks laid per day was appreciably increased. From that time onwards great developments have been made in the United States in the study of the many problems of a psychological nature which inevitably follow from this elementary beginning, and the result is that we find most of the literature on the subject emanates from across the Atlantic. The war, however, gave those who have taken it up on this side their great opportunity, and, to their credit be it said, advantage was taken of it to the full. The reduction of working hours in many munition factories—where at the beginning of the war workpeople were allowed to be at work all hours of the day and night, merely with the object of drawing as much pay as possible,—and an improvement in the output in consequence, was directly due to this study of industrial psychology, of which Dr. Myers is the leading exponent in this country. Fatigue, for instance, is now actually measured by an instrument known as the ergograph, by which the exhaustion of a single muscle is recorded, and that in itself has led to the elimination of cases of over-fatigue due to the many causes which occur in the working and domestic lives of the workpeople of the world. The extent to which industrial psychological investigation has now been carried may perhaps briefly be indicated by saying that much has been done in the direction of determining what is the best rest pause, such investigations, of course, being endless in variety, having regard to the multitude of occupations. The monotony of work, and the result of its effect upon output, needless standing and stooping, the proper selection of workers, and so on, have all been investigated, even in this country, with a thoroughness which few people here recognise, although most of the statistics of results obtained under actual practical conditions have still to be drawn from the United States. From a thousand and one causes it is evident from only a superficial study of the work that is being done that there is a vast amount of human energy wasted in industrial operations, which, properly conserved, could be turned to financial profit to the worker, to the employer, and to the nation at large. In the same category, of course, come the questions of scientific illumination and heating and ventilation, although these latter rest more with the employer than the employee. At the same time, they have been proved to have an enormous influence upon output and in the prevention of accidents. Probably the most noteworthy feature arising out of the study of industrial psychology is the large extent of saving which often arises from the most simple of changes in old methods, and it is for this reason that employers in general throughout the country are well advised to keep themselves in close touch with industrial psychological developments. These constitute a distinct branch of scientific management, which, however, can be regarded as apart from, although bearing upon, such questions as rates of pay, restriction of output, and similar matters usually associated with scientific management.

PROTECTION FOR AMERICAN DYE-STUFFS.—*Reuter's* Washington correspondent states that the Republican members of the House of Representatives Ways and Means Committee have decided to recommend a bill providing for a licensing board to control dye imports, and levying a high tariff on all foreign dyestuffs.

JAPANESE CHEMICAL INDUSTRIES.

A CORRESPONDENT at Osaka forwards some interesting particulars concerning the Japanese chemical industries, notably the manufacture of caustic soda, chlorate of potash, and paints.

Before the war there were only two firms manufacturing caustic soda, viz., the Nihon Seimi (the Japan Chemical Industry Co., Ltd), Osaka, and the Kwanto Sanso (the Eastern Japan Soda Manufacturing Co., Ltd.), Tokyo, both of them using the Leblanc process. The output, however, in 1913 was only 4,300 tons, while the total Japanese consumption was in the neighbourhood of 16,000 tons. The difficult situation caused by the drop in imports from the United Kingdom, as a result of the war, brought about the establishment of further soda factories, with a total output in 1918 of 20,530 tons. The demand, in consequence of the development of Japanese industries, had also increased, and in the same year was nearly 31,000 tons. Prices both of caustic soda and soda ash advanced rapidly, and manufacture proved profitable to the firms engaged in it. Not long after the signing of the Armistice, however, a reaction set in. With the prospect of resumed importation from the United Kingdom and America, the market was badly hit, and consumers who had entered into contracts with the makers at the higher prices, in numerous instances repudiated the agreements, the only buyers being hand-to-mouth users. From November, 1918, up to March of the present year the imports of caustic soda amounted to 3,565,000 kin, and of soda ash, 56,611,000 kin. Heavy manufacturing costs prevented manufacturers producing at a competitive price, and at the time of writing most of the plants were running at no more than one-third of their total capacity, and during the present year the attention of producers is being directed more to avoiding losses on operations than to the making of profits.

The Kwanto Sanso Company, one of the two principal producers of soda compounds, acids, fertilisers, etc., before the war, concentrated on the manufacture of soda compounds and other chemicals for which the market conditions were favourable. In 1917 the capital of the concern was largely increased and the electrolytic process was substituted for the Leblanc process. The new plant however was found to be so difficult to operate that its full capacity was not reached until after the signing of the Armistice. The dislocation of the market had a very serious effect upon the company, but owing to the fact that its products had many influential selling agents in various localities, and that there is a good market for bleaching powder, the company can be said to be in a tolerably favourable position.

The consumption of chlorate of potash prior to the war was 3,200 tons, most of which was imported from Germany. The domestic output was confined to that produced from the treatment of chloride of potash, a by-product from the manufacture of iodine. With the cutting off of the German goods, the price rapidly advanced until it was at least ten times the normal, thus furnishing sufficient incentive for developing manufacture in Japan. In 1917 the output reached 5,000 tons, and in 1918, 7,000 tons. In consequence the market price dropped considerably, and, notwithstanding the fact that a fair amount commenced to be exported, some of the producers were compelled to shut down their plant. The fall in price has been accentuated since the cessation of hostilities. Only a few of the firms continued to produce, and those only to a limited extent.

In the paint industry a similar state of affairs now exists. The export of paint from Japan in 1913 was only 70,000 yen, and in 1914, 660,000 yen. In the preceding years British paints of all kinds, for obvious reasons, practically disappeared from the Eastern markets, and in 1916 the Japanese exports had increased to 994,000 kin, valued at 236,000 yen; in 1917, 1,830,000 kin, valued at 504,000 yen; and in 1918, 11,365,000 kin, valued at 4,331,000 yen. Moreover, with the great developments that were taking place in the shipbuilding industries, the domestic demand had increased in a corresponding ratio. Since November last the change in the situation has been remarkable. From 1,411,000 kin, valued at 557,000 yen, in November, 1918, the exports of paint declined to 1,036,000 kin, valued at 466,000 yen, in December; 255,000 kin, valued at 115,000 yen, in January; and 183,000 kin, valued at 69,000 yen, in February of this year. Lessened activity in the shipbuilding industry considerably reduced the home demand, and a fall in the price of paints was experienced.

ALKALI INSPECTOR'S REPORT FOR 1918.

THE annual report for 1918 of the Chief Inspector of Alkali, etc., Works (Mr. W. S. Curphey) on the proceedings under the Alkali, etc., Works Regulation Act, 1906, has, as announced last week, now been issued. The following comments are made on the various classes of works under inspection.

Alkali and Copper (Wet Process) Works.

The general average escape of muriatic acid from the chimneys in these works was 0.076 grain per cubic foot of chimney gases. This figure is well within the limit of 0.20 grain fixed by the Act, and compares with 0.089 grain in 1917. The district averages varied between the maximum of 0.101 grain and the minimum of 0.030 grain per cubic foot. The percentage of muriatic acid condensed varied between 97.40 and 98.90, the average being 98.00, against 97.81 in 1917.

In no case was it deemed necessary to initiate proceedings to enforce the penalty incurred by emission of an undue proportion of muriatic acid, but in one case, where a temporary cessation of testing the chimney gases led to an undue escape being unknown to the management, warning was given as to the necessity of maintaining efficiency in this respect.

The management at one works gave information of a local complaint which had been received during a week of fogs and light winds, which atmospheric conditions are the most trying for this class of work. In the past this works has been the subject of repeated complaint, but with increased draught on the furnaces and better general conditions much improvement has been effected.

At one works a saltcake pot broke suddenly, causing its contents to fall into the fire flue, thus interfering seriously with the draught of the furnace. At the same moment a workman was engaged in the stokehole, and a blow back caused by the stoppage of the draught led to the man being so seriously burned that death ensued. This sad result was the consequence of an accident of a most unusual kind, but steps have been taken to avoid, as far as possible, its recurrence.

The development of electrolytic methods for producing alkali and chlorine was very considerable. Through the influence of the ammonia-soda and electrolytic processes the operation of the Leblanc process was materially curtailed towards the end of the year. The outlook is that this process, which has held the field for so many years, must, as regards the manufacture of alkali, yield to that combination of the two newer methods which will supply the market with the desired quantities of alkaline and acidic products. Already the change has been made in several alkali works in more than one centre of the industry, and is accompanied by working conditions much less liable to cause an emission of noxious gases, as the evolution of these in the course of manufacturing operations is very greatly lessened. The demand for hydrochloric acid and saltcake will still cause the decomposition of common salt with sulphuric acid, but to a much smaller degree, and distributed more widely throughout the country in works of smaller individual magnitude.

Cement Works.

The number of this class of works was one greater than in 1917. This industry, like most others, suffered from war conditions, and the output was much below the full capacity of the available plant. Repairs to machinery and general upkeep fell into arrears. Consequently, much requires to be done before a maximum output can be reached.

The question of potash recovery from kiln fume continued under consideration, but little definite progress of a practical character can be reported. During 1918, as in previous years, considerable quantities of the heavier particles were deposited in flues and were utilised for agricultural purposes, but much of the finer particles still escape. The question of potash recovery generally is under special attention, and much progress has been made in connection with industries other than cement manufacture which offer a more attractive field for effort.

Complaints were made by a local authority of excessive discharge of dust from one cement works which has been the subject of similar complaint in past years. The powers under the Act, the nature of the discharge complained of, and the local circumstances did not warrant coercive action.

Smelting Works

The number of this class of works was 83, an increase of seven over the total for 1917. This increase was largely due to new registrations in District VI., which includes the highly mineralised counties of Devon and Cornwall.

The general average acidity of the chimney gases discharged from smelting works (3.153 grains SO_2 per cubic foot) was slightly less than in 1917. This was due to a marked decrease in this acidity in all districts except VIA. and VII. In District VII. the number of such works is small, whilst the increase in acidity was not great. In District VIA., however, very different conditions existed, where the excessive proportion of sulphurous gases sent into the air from the roasting of ores containing sulphide of zinc materially affected the average of the whole country, and induced a district average (8.19 grains) in marked contrast to all the other district averages. This calcination of zinc sulphide ores, accompanied by discharge into the atmosphere of all the acid gases formed by the combustion of the large proportion of sulphur in these ores continued in far too many cases. The manufacture of sulphuric acid from the sulphurous acid obtained in a sufficiently concentrated form where these ores are calcined in furnaces of suitable design has an established standing in this country. It is undesirable that the calcination of these ores should be continued any longer than is absolutely necessary in those furnaces which, indeed, prepare the ores for the subsequent extraction of zinc, but disregard entirely the condensation and utilisation of the sulphur acids formed at the same time. This is a form of atmospheric pollution which is preventable by means which achieve other advantage than a diminution of discharge of noxious gases of great prejudice to the locality in which such operations are carried on.

The use of sulphide ores other than those of zinc was materially less during the year, owing to a more limited available supply. This was due in part to the development of methods for treating ores at mines in other countries, thus leaving less to be done in those works where ores were used imported in their natural condition.

The deposition of fumes continued to receive attention. Mechanical methods continued in successful operation, whilst electrical methods extended, both as regards the scale of operations in those works where these methods were previously in use, and as regards the number of works in which they have been adopted.

Sulphuric Acid Works.

The number of this class of works registered was 146, a decrease of one from 1917.

The general average escape of acid gases from the lead-chamber process (1.225 grain SO_2 per cubic foot) shows a decrease from that for 1917 (1.342 grain), in which year there was an increase over 1916. The reduction in acidity of discharged gases was very general; only in two districts was there a slight increase, but the variation was not of marked degree in any instance.

The year was one of anxiety to owners of this class of works. The large increase in productive capacity in works specially erected to meet the abnormal war requirements eased the heavy pressure which was in evidence previously, whilst the conclusion of the armistice profoundly affected the aggregate production of sulphuric acid. New plants erected on modern lines were not put into operation, several plants already in operation were stopped, and certain others ceased operation owing to destruction by fire. The easing of pressure for urgent delivery of acid from the older plants permitted of greater opportunity for temporary stoppage for repairs in many cases, but difficulties regarding labour and material were obstacles to rapid progress, causing much delay and hindering work which would otherwise have been undertaken. Still, extensive repairs were effected and improvements carried out in many works, so that the general condition of working plant throughout the country was materially improved. Certain works which previously were cause of anxiety were put into much better condition.

Although cases occurred where an amount of acid gases in excess of the statutory limit was discharged, these formed a very small proportion of the total tests made. In no case was it deemed necessary to take proceedings to exercise the powers

of the Act. In one works, where experimental work with iron contact towers under adverse working conditions led to much worry and irregularity in the chamber process, the exit gases were for a time abnormally high, otherwise the excessive escapes noticed were temporary.

The various types of plant for the "chamber" process continued in operation. Those of the newer designs calculated to work with limited chamber space continued to give satisfaction. There were also instances where a combination of the newer with the older type was in use. It is, however, open to discussion whether it is wise to combine two systems which differ in fundamental characteristics. In the report for 1917 reference was made to the wide variation in the time factor in an Opl plant as compared with a chamber plant, the figures being 12.3 minutes for the former, and 144 minutes for the latter. At the time the measurements of duration of reaction were made the chamber spaces were approximately $1\frac{1}{2}$ cubic foot and 16 cubic feet per lb. of sulphur burned per 24 hours, a ratio which is almost the same as that of the time observed.

In the Mills-Packard system the chamber space varies from 3.6 to 4.5 cubic feet, so that, if the direct relationship be general, the time required in this system for completion of the chamber reactions should be something of the order of 50 to 40 minutes.

One of the prime factors governing the speed of conversion of sulphurous into sulphuric acid in the chamber process is the ratio between the sulphurous and the nitrous gases in process; but a ratio which is suitable for a time period of 40 minutes is less suitable for a period of 120 minutes. It would seem that if the gas composition is adjusted to suit the small chamber space section of such a compound unit it will be too nitrous for the other section and more rapid corrosion of lead may be looked for. If, on the other hand, the gas composition is adapted to the large chamber space section the nitrous gases will be too low in proportion to ensure that rapid make and condensation of sulphuric acid which is the feature of the small chamber space section. An intermediate gas mixture is not calculated to elicit the best results from either section.

The more thorough system of control of the chamber process by a more complete examination of the composition of the gases in process at successive points of the plant did not come into use to any great extent. This is to be regretted, as it is only by careful study of detailed working results that higher standards of efficiency are to be hoped for or advance made in working methods.

The use of nitrous gases produced by the oxidation of ammonia by catalytic influence, in place of nitrous gases produced in the customary way by the decomposition of nitrate of soda with sulphuric acid, continued to give much satisfaction in those works where it was in operation. The operation of this method was considerably extended, both by its adoption on a larger scale where it had already been in use and by its introduction to many other works where the ordinary system had been alone relied upon. As experience is acquired its facility of control and uniformity of operation are the more recognised. It is also stated to be the less costly, but this aspect will be dependent upon the relative cost at the works of the raw materials used, whilst other factors will have an influence on the future comparative development of the two methods in vitriol chamber practice.

The preliminary oxide of iron contact towers erected between the burners and the Glover tower were under trial in several works, but did not give such good results as were anticipated. This disappointing experience was due to a variety of influences. In some works the device was attached to burners using spent oxide, but the dust accompanying the burner gases was too much, and the choking of the tower interfered with the draught necessary for effective working. At one works the movement of the chamber gases, induced by a chimney with feeble draught, was already at a minimum, so that the increased resistance of the additional tower likewise led to unsatisfactory working of the chamber process. At another works faulty construction caused failure for the time being. Less progress was thus made than was at one time expected. But there is no reason to anticipate that success will not reward persevering effort to overcome obstacles which, after all, are of a secondary character.

The trouble caused by dust carried forward with the burner gases continued as in past years to be prominent, and received much attention. Some of the difficulties just referred to in the trial of preliminary oxide of iron contact towers were associated with the hope that a simultaneous removal of this dust might be effected. A modification recently introduced continued to give satisfaction. It consists in removing part of the dust in depositing flues, in subsequently cooling,

washing, and filtering the burner gases for further removal of dust and for removal of other impurities somewhat after the procedure followed in preparing similar gases for use in contact processes, then by pre-heating the cooled purified gases in a heat interchange chamber by utilising hot gases leaving the burners, and by finally heating the gases by aid of fuel to cause the gases to enter the Glover tower at the desired temperature for the usual chamber practice. This entails a somewhat more elaborate plant and an increased fuel consumption, but the advantages secured by the production of a high-grade acid and more regular work are distinct.

At one works, where complaints have been frequent in the past, although the acidity of the discharged gases is usually considerably less than one-half of the maximum permitted by the Act, the addition of a section of different design to the plant previously in operation has, Dr. Fryer reports, made a marked improvement in the character of the escaping gases as judged by the senses, although the total acidity as measured by chemical methods has not undergone much reduction.

Zinc blende continued to be the source of sulphur used successfully in a small number of works for the manufacture of sulphuric acid by both the chamber and contact processes. The type of furnace in use varied in different works, mechanical as well as hand-worked types being in operation.

Mr. Sutton, in his report upon District VII., refers to a burner for spent oxide automatic in character but devoid of moving parts, in the following terms: "The furnace consists of a circular brick structure about 20 feet high with internal spiral flues, the inclination of which is adjusted at various points in such a way as to ensure a continuous and even flow of the oxide material by gravitation only. The oxide is fed in at the top continuously by chain feed. The experimental furnace had one flue only, and has worked (with stoppages to perfect the inclination of the spiral) for nearly two years. The furnace is now being reconstructed to have three internal flues, and it is expected to be capable of dealing with six to eight tons of oxide per diem."

Sulphuric Acid (Class II.) Works.

CONTACT PROCESSES.

The three types of this class of works, as referred to in past reports, continued in use. Pyrites and sulphide ores of zinc were the sources of sulphur utilised. The latter was of more recent introduction to contact process work in this country, and proved satisfactory for acid-making, whilst the calcined ore was suitable for the extraction of zinc.

The thorough purification of the impure acid gases derived from the burning of pyrites, so necessary for the maintenance of the activity of the contact material, was found to be most difficult of achievement in several cases. Despite the elaborate and costly plant provided for this purpose, much trouble, expense, and loss of time were incurred through inefficient conversion of SO_2 into SO_3 , causing a high escape of acid gases along with a low production of "oleum." These purification arrangements are being remodelled and improved.

At one factory, owing to pressure for munition requirements, a section of the plant continued at work long after it was in need of repair, and caused much anxiety from undue escape of acid gases. When relief came from a less urgent demand, this section was promptly laid off for attention.

CONCENTRATION PROCESSES.

There was a marked reduction in the number of exits tested—from 135 in 1917 to 99 in 1918,—and a further reduction in the acidity of the gases discharged compared with 1917 and 1916. The aerial pollution from this class of works was therefore materially lessened. This was due in part to improvement in design and better maintenance of plant, in part to the diminished pressure upon the plants at work owing to the increased capacity of production of high-strength acid by other methods.

One works was destroyed by fire and may not be rebuilt. In several works operations were carried on intermittently from lack of demand for strong acid.

Gaillard towers continued in use, but to a more limited extent. This type of plant was still characterised by emitting the discharged waste gases higher in acidity than the others. The modified form of the Kessler concentrator did highly satisfactory work, whilst the ordinary Kessler and its allied forms maintained their standard of efficiency. The cascade systems continued in operation with varied efficiency in different works. The Davis concentrator was used for bringing chamber acid up to about Glover tower strength,

and gave satisfaction. With this limited degree of concentration, the evolution of acid gases is not so prominent a feature as is the case with production of concentrated acid of the highest strengths, and the means provided secured a low acidity in the gases finally discharged.

The Calder-Fox scrubber referred to in the 54th annual report was further improved in the light of accumulated experience, and is an efficient remover of suspended liquid particles.

Although several unduly high discharges of acid gases were observed, these occurred in different works, and in no case was it deemed necessary to enforce the penal powers under the Act.

There was one fatality due to a man being gassed whilst cleaning out a tank used for storing concentrated sulphuric acid. The medical evidence showed that death was due to arsenical poisoning. It still seems necessary to call attention to the dangers of working in such tanks without proper ventilation, both prior to anyone entering and also throughout the period whilst anyone remains in them, and to the necessity for taking precautions against the existence or formation of arsenuretted hydrogen.

Nitric Acid Works.

The number of this class of works was 96, a decrease of five compared with 1917. There was further decreased activity in the works in operation as compared with the immediate past, so that there was a marked reduction in the production. This rendered more easy the attainment of conditions for satisfactory working, and condensation of the nitrous fumes developed was effected efficiently in all cases.

In the great majority of works the nitric acid was still manufactured by the decomposition of nitrate of soda, but a material proportion was obtained from the oxides of nitrogen resulting from the oxidation of ammonia and from the use of nitric acid in various processes of chemical manufacture.

The utilisation of nitre-cake continued to receive attention, and latterly use was found for all that was available.

Chlorine Works.

The number of this class of registered works was 32, an increase of two over 1917. This increase was due to the registration of works in which chlorine, received in the liquid form, was used in chemical processes. The production of liquid chlorine was effected on a large scale. The liquefaction was carried on most efficiently with a minimum loss of this noxious gas.

The electrolytic methods for production of chlorine came into much more extended use during the year, and led to the stoppage of several units of the long-established Leblanc alkali process to which reference has already been made.

Muriatic Acid Works.

The number of this class of registered works was 69, an increase of three over 1917. This increase was chiefly due to the production of muriatic acids in works using liquid chlorine for preparation of organic products by processes in which muriatic acid is formed as a secondary product. In all cases prevention of atmospheric pollution was efficiently carried out so far as the limited inspection possible permitted observation of working conditions to be made.

The wool carbonising industry was active throughout the year. Carbonising machines of improved type were brought into more extended use.

The tinplate works were restricted in their operations by limited supplies both of labour and material. This limitation of output influenced the quantity of tinplate flux to be dealt with in the furnaces, and lightened the work to be done by the means in use for preventing undue escape of muriatic acid. There was a reduction in the proportion of this gas which is allowed to escape from works of this class situated in Districts VI. and VIIA. There were, however, some cases in which improvement is still required. The use of nitre-cake for pickling the steel plates prior to tinning continued to be widely and successfully practised.

Sulphide Works.

The number of this class of works registered was 98, a reduction of three from 1917. There was, especially towards the end of the year, a contraction in the purification of sulphuric acid from arsenic by means of sulphuretted hydrogen. The "Trepex" plant designed for this purpose came into more extended use in the course of the year.

Three men were gassed, but fortunately without fatal effects, by an escape of sulphuretted hydrogen from a plant

for the dearsenication of sulphuric acid. The pipe for removal of the sulphuric acid, after being subjected to the action of the sulphuretted hydrogen, was sealed to a proper depth; but examination of the seal pipe proved it to be defective, so that an escape of gas occurred through an opening which was not sufficiently immersed in the sealing acid. This defect was at once remedied when recognised.

One group of works included in this class consists of works in which certain dyes are made by the interaction of a metallic sulphide with suitable organic substances. In such operations much sulphuretted hydrogen may be evolved. Similar dyes are made involving chemical action between sulphur and organic compounds, but in which no metallic sulphide is used. In such cases also much sulphuretted hydrogen may be evolved, but they do not come under the control of the Act.

The means in use for preventing escape of sulphuretted hydrogen in those works registered were satisfactorily operated and maintained. Improved conditions were brought about through the replacement of old manufacturing plant by new plant more efficient in design.

Alkali Waste Works.

The extent of operations in this class of works was greatly reduced. The production of alkali by electrolytic methods avoids the formation of alkali waste, so the further extension of those methods already referred to entailed a corresponding reduction in the quantity of waste available for treatment for recovery of sulphur. The number registered remained as in 1917, but the curtailment in operations will lead to fewer works of this class remaining in operation in the future. The various works were maintained in an efficient condition, and the prevention of undue escape of noxious gases was satisfactory. With the reduced scale of operations, there was therefore a diminution in the total quantity of offensive gases discharged into the air from these works.

Arsenic Works.

The number of this class of works registered was 52, an increase of seven over 1917. The attractive prices for white arsenic led to the starting of several new works, which might have been still more numerous had labour and material been more readily at command. In all those works registered the requirements of the Act were complied with.

Dr. Fryer, in his report on District VI., gives numerous results of his testings to note the efficiency of the condensing plants in these works and the character of the gases discharged from them. From his report the following figures have been extracted:—

	Per Cubic Foot of Chimney Gases.	
	Grains Arsenious Acid.	Grains Total Acidity.
Escaping from refinery furnaces:—		
Highest average in any one work	0.064	1.35
Lowest average in any one work	0.024	0.39
District average	0.042	0.72
Escaping from mechanical calciners:—		
Highest average in any one work	0.075	2.15
Lowest average in any one work	0.012	0.63
District average	0.038	1.28
Escaping from hand calciners and roasters:—		
Highest average in any one work	0.088	4.89
Lowest average in any one work	0.023	0.63
District average	0.043	1.82

As in previous years, dry filters proved more efficient than wash towers for arresting arsenious acid, although with both types the final escape was satisfactory. Dr. Fryer gives in his report the following average figures:—

Form of Condenser.	Arsenious Acid. Grains per Cubic Foot.		Condensed per cent.
	Before Condenser.	After Condenser.	
Dry filters	0.456	0.042	90.8
Wash tower	0.152	0.033	78.3

Bisulphide of Carbon Works.

The number of this small class of registered work was five, the same as in 1917. There was active manufacture, and the steps taken to prevent aerial pollution were increased in efficiency.

(To be continued.)

PATENTS IN RELATION TO INDUSTRY.

A CONFERENCE on the relation of patents to industry was held at the British Scientific Products Exhibition on Thursday, July 31, Lord Moulton presiding.

Sir Robert Hadfield, F.R.S., who opened the discussion, said that through the Federation of British Industries, and also the British Commonwealth Union, which did the Parliamentary side of the work, they would have a very good chance of getting the views of industry put before Parliament in a way which was not easily otherwise possible. The Federation was backing up the views that had been expressed by the conference of scientific and technical societies which had already gone into the question in regard to the new Patents Bill, and agreed that there should be a much longer term for the life of patents, that the file wrapper system should be adopted as was the case in America—the file wrapper system consisted in allowing an examination of the various remarks by the examiner on any particular application—the constitution of a special tribunal for dealing with patent actions, and an extension of the term of provisional protection from six months to two years.

Mr. Douglas Leechman said that under clauses 1 and 2 of the new Patents Bill the patentee might, voluntarily or involuntarily, find himself in the position that he had to grant licences to practically any person who liked to apply. If a patentee thought of having his patent endorsed "licences of right" because the Government offered him a bait in the shape of a reduction of his renewal fees, by 50 per cent., he would like to draw his very careful attention to these clauses. For instance, under clause 2, sub-section (d), the "licensee shall be entitled to call upon a patentee to take proceedings to prevent the infringement of the patent, and if the patentee refuses or neglects to do so within two months after being so called upon, the licensee may institute proceedings for the infringement in his own name as though he were patentee making the patentee a defendant." He would not trust himself to comment upon that sentence. The licensee could call upon the inventor to take an action against somebody whom the licensee thought was infringing, whether he was or not, and could force the inventor into litigation that might cost him hundreds or thousands of pounds when he had received royalties, perhaps, of £10 or £20. He therefore cautioned any patentee who thought he was going to save money on his renewal fees in this way that he would be putting his head into the noose if he accepted that clause. He thought it was the most foolish thing in the world for the Government to throw away a whole lot of good inventions as was being done in regard to the patents which could not be worked during the war. A number of objections had been raised to a moratorium for patents, the chief of which seemed to be that if they did this for patentees they would have to put everybody else in the same position that they were before the war, and that, said the Government, was impossible. He had heard no other serious objection but it was in the interests of industry that this should be done and he urged that a moratorium for patents should be made the subject of a Bill and passed through Parliament quickly.

Mr. James Swinburne, F.R.S., said that the monopolies that were granted to inventors were ridiculously small in proportion to what was wanted in the way of motive to make the country go ahead. One of the fundamental difficulties was the fallacious idea that anybody who made money was robbing the community. That was one reason why inventors were not encouraged properly. He believed that even industrial people had the idea that if inventors were encouraged by granting them monopolies, trade was hampered and that everything the inventor made was taken out of somebody else's pocket. He was afraid there would always be a strong prejudice against patents because people did not realise that a patentee's royalty was really a very small payment for a very big work, work upon which the prosperity of the nation depended.

Sir G. Croydon Marks, M.P., suggested that they should be fair to the Board of Trade in this matter and examine what it was that was proposed in the Patents Bill now before Parliament. The Bill lengthened the life of all patents by two years and that two years was added to the end of the first four years, so that renewal fees would not have to be paid for six years. At the same time he agreed that the Bill did not deal fairly with those patents which could not be worked during the war. The fact that such a large proportion of

patents fell out at the end of the initial period of four years showed that the fee charged for that period had not been detrimental to the patenting of inventions. It was the renewal fee that caused the trouble. Therefore by lengthening the period by two years before the renewal fee had to be paid, they were giving the inventor encouragement just at the most difficult period of his invention—at the beginning. Another encouragement was that if an inventor had not the means to work out his invention himself, he could have his patent endorsed "licences of right." That was an invitation to all the world to come to the man and take up the invention, and at the same time the inventor only had to pay half the renewal fees. He regarded that as a very great concession.

Lord Moulton in bringing the Conference to a close, said they had heard of the gifts that inventors had given to the country but there had not been a word to suggest that they were paid for by the country consenting to put itself under restrictions for 14 years from using ideas which might well occur to it. Therefore, if they wished to convince the public, inventors must show that they realised that, and must also show that their claims over-top that so much that more liberal terms ought to be given them. To do that, they must frankly confess one thing. When they heard of the tens of thousands of patents that were taken out, there was no man on his side of the table who did not know that 50 per cent. of them were rubbish and that most of the others were of very little value. Therefore, they must realise that the public was suspicious when these inventions were put before them by patents and it was found that so few of them were meritorious. The value of those that were meritorious could not be over-estimated but there were many trivial things that were made the subject of patents which did not justify them in speaking of the person who was the patentee as an inventor. The test of that was in the number of cases in which a man, by not renewing his patent, in effect said that it was not worth £10 to him to protect it any longer at the end of the first four years. Renewal fees, therefore, were a valuable test as to whether an invention was of substantial utility. Nobody esteemed the value of invention to industry more than he did, but such patents as those he had referred to restrained invention. A man took out a patent in which probably 50 improvements could be made but could not be developed because of the earlier patent. It was to remove that difficulty that the system of compulsory licences was introduced in the interests of the country and in the interests of invention. One of the things that had done the inventor so much harm in this country was that nothing was considered anticipation that could not be shown to have been published in England, whereas the invention might not be new. Patents came from America and Germany by way of communications, and according to English law the person who communicated them was called the inventor. One of the primary duties of an inventor in drawing up a patent was that he should frankly tell the public the best way he knew to work his invention. It must be drawn up in the utmost good faith between the inventor and the public in order that when the patent lapsed, the public might enjoy the full benefit of the practical use of the invention. But suppose it was communicated through a patent agent? The patent agent was the inventor. The duty applied to him only but he knew no more of the subject than was in the document itself. The man who really knew was either in America or Germany and he might have abundant knowledge which he ought to put into the specification and which he would have to put into the specification if he were an Englishman taking out a patent, but because he was abroad that basic duty of the patentee to give his best knowledge to the English nation in return for the monopoly granted him, became an absolute dead letter. If, in attempting to amend the patent law, these things which damaged the nation and the commerce of the nation, were put forward, he believed that patentees would get generous terms from the nation. He did not think that the nation was niggardly towards patentees at all. He believed, as Sir George Croydon Marks had said, that the new Bill was an attempt to give a new Charter to inventors. It lightened the burden on them in many ways, but one thing the country was determined upon was that the grant of a patent should help the trade of the country and not strangle it. During the last 30 or 40 years, the patent law of this country had been worked, mainly by people outside—very slightly, comparatively, by people who were Englishmen—solely for the purpose of keeping trade out of the country and strangling the trade of the country.

CHEMICAL INDUSTRIES OF INDIA.*

By DR. J. J. SUDBOROUGH AND DR. J. L. SIMONSEN.

IN any attempts to foster the development of chemical industries in India attention should be directed, in the first instance, to industries which make use of the Indian grown raw materials now exported to other countries, where they are worked up into various finished products. Included in these exports are (1) the raw materials from which important fixed oils and feeding cakes are manufactured (2) the raw materials from which valuable essential oils and medicinal drugs are prepared and (3) various mineral products such as chrome, manganese and zinc ores, wolfram and monazite sands, all of which are exported to Europe and are there worked up into important metallurgical or other technical products. The production in India of all the common salt consumed in the country, both high grade salt for edible purposes and lower grades for industrial purposes seems also well within the range of possibility.

The development of certain specific industries may be relatively simple. If India is practically the only producer of the raw material in question, the working up of the raw material and the export of the finished product may be comparatively easy, as competition from foreign countries is eliminated. In most cases, however, such as oil seeds, minerals, etc., India is not the only producer, and during the early stages of developing the industry keen competition with foreign countries must be expected. In fact it is possible that certain countries or foreign firms will be prepared to flood the Indian market with a product at less than cost price in order to destroy a struggling industry during the first years of its inception.

The whole problem is complicated by tariff questions. The desirability of introducing export duties on raw materials but of allowing free export of the corresponding manufactured products, to be considered. On the other hand, foreign countries will frequently allow Indian raw materials such as oil seeds or minerals to be imported free of duty but levy a relatively high tariff when attempts are made to import the finished products derived from these raw materials.

Mineral Acids.

Sulphuric acid may be regarded as the "key industry" for all chemical industries. As the acid is extremely cheap and also excessively corrosive, it follows that, as a rule, freight charges will be relatively heavy and hence it is usually necessary to manufacture in certain centres where large quantities are required.

The quantity imported into India in 1912-13 and 1913-14 varied from 2,000 to 3,000 tons a year and it is estimated that about 18,000 tons are actually manufactured in the country, so that in India this 'key' industry is quite in its infancy.

As large deposits of iron pyrites have not been met with in India, practically all the sulphuric acid is made by burning sulphur imported from Sicily or Japan. This yields a good quality acid, free from arsenic, but is much more expensive. The price of imported sulphur in India in 1913 was about £5.-£6. per ton and as 1 ton of sulphur yields about 3.4 tons of sulphuric acid, it is clear that, even if the factory costs are reduced to their minimum, the selling price of Indian-made sulphuric acid in Calcutta or Madras must be much higher than the ordinary pre-war price in London.

The future of the industry in India is promising, as it has been decided to work up at Singhbhum the Burmese zinc concentrates for the production of spelter. These concentrates consist largely of zinc sulphide, and when roasted produce sulphur dioxide, which can be used for the production of sulphuric acid in the ordinary lead chamber. As the sulphur dioxide is a by-product, its cost should be much less than sulphur dioxide produced by burning imported sulphur, and hence the cost of producing sulphuric acid in India should correspond more nearly with that of American or European acid.

Nitric acid is now made in India in quantity sufficient to meet the demand and we are given to understand that with the plant at present available any reasonable increase could be met although, of course, should the manufacture of dyes or explosives be undertaken considerable extensions would be required. The imports are small.

The acid is manufactured by heating sodium nitrate (Chili saltpetre) with sulphuric acid. The imported nitrate is pre-

ferred to Indian saltpetre (potassium nitrate), since it is cheaper and is less liable to contain chlorides, which must not be present if a good quality acid is required. The purification of the potassium nitrate presents no great difficulties and it is possible that with improved methods a pure saltpetre could be produced as cheaply as the material containing several per cent. of chlorides now put on the market. A further advantage which would result by the substitution of potassium for sodium nitrate is that the by-product from the manufacture, potassium hydrogen sulphate, is of much greater value than the corresponding sodium salt, as it can be used as a potash fertiliser after neutralisation with lime.

The question of replacing or supplementing the present method of manufacture by one of the processes now in use in other countries for utilising atmospheric nitrogen is one which requires careful consideration, if the manufacture in India of explosives and dyes is contemplated.

The price of commercial concentrated hydrochloric acid in 1914 was Rs. 300 per ton in Madras. With a supply of cheap sulphuric acid it will doubtless be possible to put hydrochloric acid on the Indian market at a price which will render its use in other industries more feasible. The Indian output at present is approximately 600 tons per annum, whilst comparatively little is imported.

Alkalies and Common Salt.

Second only to sulphuric acid in importance for the development of chemical industries are the alkalies, sodium carbonate and caustic soda, since little expansion of other industries can take place, unless these chemicals are available in large quantities at low rates. The following table indicates the magnitude of the imports into India.

IMPORTS OF SODIUM CARBONATE AND CAUSTIC SODA.

Year.	Sodium Carbonate.		Caustic Soda.	
	Quantity.	Value.	Quantity.	Value.
	Tons.	£	Tons.	£
1912-13	13,856	74,574	4,942	53,534
1913-14	21,157	106,172	4,910	58,379
1914-15	22,628	116,423	5,905	70,311
1915-16	27,639	157,117	4,395	64,845
1916-17	18,376	129,740	2,855	79,128
1917-18	35,014	288,194	5,855	222,861

Crude sodium carbonate, contaminated with varying amounts of common salt and sodium sulphate, is found as an efflorescence in certain districts during the hot weather. This alkaline earth or *reh* is collected and used by *dhobies* for washing purposes. The increase in the prices of sodium carbonate owing to the war led to further investigation of these alkaline earths, and fairly pure sodium carbonate was extracted in both the United Provinces and Mysore, the method adopted being somewhat similar to that used for extracting saltpetre from the soil in Behar and the Punjab. It is certain that such methods will not prove profitable when the price of the chemical falls.

In Sind, and especially in Khairpur State, larger quantities of sodium carbonate—also in most cases somewhat crude and mixed with chloride and sulphate—have been met with as deposits in the basins of certain lakes. In 1915-16, about 350 tons were produced in the Nawabhat District, and about 3,600 tons of this crude product were available in Khairpur State. These deposits are being examined in order to see if refining on a comparatively large scale would be profitable, but in any case it is very doubtful if the whole requirements of the country could be supplied from such sources.

The possibility of the manufacture of both these chemicals in India in sufficient quantities and at such rates that they could compete with the imported articles needs careful consideration. This manufacture may be regarded as a key industry, as sodium carbonate and caustic soda are essential for many industries, of which amongst the chief may be mentioned soap, glass, dye works, coal-tar and oil refining.

The manufacture of caustic soda is dependent to some extent on that of the carbonate, since it can be readily obtained from the latter, by digesting its aqueous solution with lime, filtering the product and evaporating the clear liquid. During the last few years, this method has been adopted in several districts in India, owing to the difficulty of obtaining the imported article. The bulk of the caustic soda now manufactured in America and Europe is produced electrolytically from aqueous solutions of common salt. For

* Indian Munitions Board Industrial Handbook, 1919.

the establishment of this industry in India cheap current is an essential and the cost of the main product, caustic soda, could only be reduced to a figure comparable with the selling price of the imported article by making use of the by-products. The hydrogen could find a market for the refining of oils by hydrogenation, whilst the chlorine could be used for the manufacture of bleaching powder, chloroform and halogenated solvents, such as chlorinated ethanes, used in solvent extraction plants.

Probably the most dangerous competitor which Indian alkali would have to meet is the sodium carbonate from Lake Magadi in East Africa. This is available in practically unlimited quantities and the sea carriage to India is short. If the manufacture of sodium carbonate and caustic soda is to be looked upon as a "key industry" then it may prove desirable to protect it, until such a time as the industry is thoroughly established.

Common salt is a substance of fundamental importance. In 1914, one and a half million tons were produced in India. About 60 per cent. of this was produced from sea water by solar evaporation in the Bombay and Madras Presidencies, about 16 per cent. from the Sambhar lake in Rajputana, 11 per cent. from the rock salt beds in the Punjab, one per cent. from the salt deposits of Sind, which are stated to be very extensive, and smaller quantities from the sub-soil water at Kharagoda in Gujarat, and also as a by-product in saltpetre refineries. The majority of saltpetre refiners, however, throw away the crude salt they recover, as they consider the purification would not repay the duty which is levied. The salt manufactured in India from sea water is usually not a high-grade article. A good deal of it is contaminated with earthy matter, and has a yellow or brownish colour and leaves a residue when dissolved in water. As a rule, it also contains appreciable amounts of magnesium chloride and thus tends to become damp in a moist climate. Undoubtedly the quality and quantity of salt manufacture could be improved.

Although very large quantities of salt are made in India, the output is not sufficient to meet the total demands of the country as shown in the following table:—

IMPORTS OF SALT INTO INDIA.

Year.	Quantity.		Value.
	Tons.	£	
1914-15	465,694	493,569	
1915-16	548,940	1,264,054	
1916-17	445,426	1,276,375	
1917-18	336,985	1,467,193	

Nearly the whole of this imported salt is of high-grade quality, and is used in Bengal where a fine-grained white salt is appreciated. Of the imports about one half come from the British Empire, mainly from Liverpool and Aden. The possibility of improving the quality of the bulk of salt manufactured in the Madras Presidency, of producing a high-grade table salt suitable for the Calcutta market and of increasing the total output of salt, so that India should be independent of the imported article, has recently received some attention. The production of a high-class fine-grained salt can be accomplished by re-crystallising the ordinary Indian salt and boiling the solution rapidly as the salt separates, or by taking greater care in the original manufacture and then grinding the product in a suitable type of plant.

Coal Tar.

The importance of coal tar in any development of the "fine chemical" industries is obvious, and the possibility of any such development in India depends on the amounts of coal tar available in the country, and also on the richness of Indian tars in the important constituents from which the valuable chemicals already enumerated are manufactured.

At the present time, the quantity of coke being made in India is approximately 520,000 tons per annum, yielding about 8,000 tons of tar*. Assuming that the content of benzene, toluene and phenol is the same as in European tar, this would yield approximately per annum twenty-two thousand gallons of crude benzole (benzene and toluene) and six thousand five hundred gallons of carbolic acid.

The introduction of scrubbing plant for recovering benzene and toluene from the coke oven gases might yield, in addition,

two million gallons of crude benzole. An examination of coal tar from Indian coals has further proved them to be relatively poor in phenols, so that the figures given above are probably too high.

A comparison of some of these figures with the corresponding figures for Great Britain and America are of interest. In Great Britain, in 1916, fourteen and a half million tons of coal were coked in by-product coking plants, and in America, in 1915, 20 million tons were coked in by-product ovens and 42 millions in beehive ovens. The output of benzole (crude benzene) in the United States of America in 1914 is stated to have been four and a half million gallons and this had risen by 1917 to forty million gallons.

It is quite clear that the amounts of tar available in India under present conditions are quite insufficient to start a large coal tar industry. It, therefore, appears that the only method by which the coal tar industry could be developed in India, would be to coke at the pit head all suitable Indian coal, and to send the tar and also the oils recovered from the oven gases to a central refinery. Such a scheme would have the advantage of diminishing the smoke nuisance caused by the burning of coal; but at present, this nuisance is not so prominent in India as in Western countries. Large quantities of combustible gas and of ammonia would also be produced. The former could probably be used for the generation of electric power on a large scale, and the ammonia would be converted into sulphate. In most countries, the ammonium sulphate thus obtained would be used as a fertiliser, but as India already exports 2,000 out of her 3,000 tons of ammonium sulphate now manufactured, the question of the disposal of much larger quantities of sulphate needs careful consideration.

Disinfectants and Antiseptics.

The manufacture of sodium permanganate should offer little difficulty, since manganese dioxide is obtainable in large quantities at a low price and the method of preparation is comparatively simple. The manufacture of the potassium salt at reasonably low cost may offer more difficulty, as, with the exception of saltpetre, potassium salts are not obtainable in India in appreciable quantities. The cost of permanganates will also be dependent on the price of sulphuric acid, which is required for their preparation.

The manufacture of bleaching powder in India on a large scale has not as yet been undertaken and cannot be, until a cheap source of supply of chlorine is available. Its manufacture will be subsidiary to the manufacture of caustic soda by electrolysis. As bleaching powder is unstable and does not keep well in hot climates,* it is essential that it should be manufactured in India. When mixed with boracic acid, itself a useful disinfectant, it forms a disinfectant, first used at Edinburgh University, known as "eupad," the aqueous solution of which is termed "eusol." Boracic acid is now being made locally from borax imported from Tibet.

Another valuable type of disinfectant which belongs to the organic group, but owes its properties to chlorine, and which has been recently introduced by Cohen and Dakin, is chloramine-T, a halogen derivative of toluene. The raw material required for the manufacture of this substance is obtained by treating toluene with sulphuric acid, and is a by-product in the manufacture of saccharine. Hence the manufacture of this disinfectant is dependent on the development of the coal tar industry.

The problem of the manufacture of carbolic acid disinfectants such as "phenyle," "lysol," etc., is complicated by the fact that Indian coal tars are extremely poor in acid constituents which are the basis of these disinfectants. They have, since the outbreak of war, been made on a small scale, but the industry is not likely to continue when conditions are once more normal, unless the coal tar industry is developed on a large scale.

(To be concluded.)

ADVANCE IN BURNING OIL.—The Scotch mineral oil companies have advanced the price of burning oil to the extent of 1d. per gallon in response to a similar increase announced by importers. The price is now 1s. 3d. per gallon in bulk and 1s. 5½d. in barrels for delivery in Scotland.

* All this tar is not manufactured in by-product recovery plants. If this were done approximately 16,000 tons of tar would become available, since 1,000 tons of Indian coal are said to yield about 21.4 tons of tar.

* Experiments in the stabilisation of bleaching powder for use in hot climates have been made by Dr. A. N. Muldum in Ahmedabad, and a preliminary note on these experiments will, it is hoped, shortly be published.

FRENCH CHEMICAL COMPANIES.

IMPORTANT SCHEME OF CO-OPERATION.

SOME time ago we drew attention to a suggestion made by a French contemporary in favour of the amalgamation of the *Compagnie Nationale de Matières Colorantes et de Produits Chimiques* and the *Société des Produits Chimiques et Colorantes Français*, which have ordinary share capitals of £1,600,000 and £1,240,000 respectively. In the meantime negotiations have been proceeding for the purpose of bringing about this union of interests, and at an extraordinary meeting of the *Compagnie Nationale* held recently the shareholders approved, in principle, an increase in the share capital to £2,840,000 and the absorption of the second company mentioned, subject to a definite decision being adopted at a future assembly. The special meeting was followed by the ordinary general meeting when the report and accounts were submitted for 1918. A few extracts from the report should be of interest.

The report recalls the futile steps taken in 1917 with the object of being placed in a position to utilise the equipment of the German dye works in France which had been placed under sequestration. These steps were continued in 1918 without obtaining any other results. A bill was recently laid before the Chamber however which, if adopted, would permit of the use of these works for the benefit of the whole of the French consumers of dyes. As the *Compagnie Nationale* had contributed largely to the preparation of the scheme, the directors had adopted measures in agreement with friendly groups for ensuring the prompt carrying out of the project on the promulgation of the law.

The report then referred to the clause in the Peace Treaty which concerns the requisition in Germany of dyes and chemical and pharmaceutical products up to 50 per cent. of the existing stocks and of 25 per cent. of the annual production subsequently for a period of five years. This requisition, which is reserved for the Allies, was optional and if sufficient quantities could be produced in France the amount of the requisition could be correspondingly reduced. These arrangements were intended to ensure supplies for consumers during the time necessary for the construction of the French works, the completion of their equipment and the education of the technical personnel. It was intended to devote the five years to rendering, as soon as possible and before their expiration, French consumers entirely independent of German manufacturers.

The installation of the company's large works for the production of synthetic indigo was continued during the year. It had been intended to start the works in June, 1918, but military events rendered necessary the removal and re-erection of the plant which was just brought into operation in June, 1919, the output having been demanded in advance. The manufacturing plant for dyes and intermediate products would be pressed forward as much as possible.

The report further states that the directors had laid the foundations of an understanding with the "great union of English producers"; various arrangements were being negotiated with the most powerful company in the United States; and they were also in agreement with the Italian producers. The directors had continued to recommend a general understanding between national manufacturers and even between the principal consumers of dyes. This policy had finally been accepted by the formation of the *Union des Producteurs et des Consommateurs pour le Développement de l'Industrie des Matières Colorantes en France*. It was to be the duty of this Union, with the support and under the control of the Ministers of Industrial Reconstruction and of Commerce, to obtain and distribute the products supplied by Germany in the best interests of French consumers.

The gross value of the sales in 1918, although still of a modest character, exceeded £200,000 of which more than half was derived from the temporary works at Landy which was equipped for war requirements. The net profits were approximately £9,000 and have been carried forward to the next account.

The Saint Denis Works.

The *Société Anonyme des Matières Colorantes et Produits Chimiques de Saint Denis*, reporting on the year 1918, states that the value of the turnover was approximately the same as in 1917, but the net profits declined owing to the increase in working expenses and the cost of raw materials. As to the future the directors do not hesitate to look forward favourably. In fact the financial charges which would rest on

Germany would re-establish equilibrium to French advantage and there was every reason for hoping that the French would be no longer crushed by German competition, especially if the customs duties were reconstructed in a judicious manner. On the other hand the English and American Governments had considered it to lie in their interests, even during the war, to favour the establishment of a powerful dye industry, and had thus created competition which was already conspicuous. It was hoped, however, to be able to meet the rivalry from these quarters.

Apart from the company's own projects the directors have subscribed £9,200 towards a company being formed with a capital of £80,000, of which one half was provided by manufacturers of chemical products and the other half by consumers. It was recognised to be unavoidably necessary to import for some years a certain quantity of foreign dyes since French makers could not at present satisfy the needs of consumers neither in quantity or in variety. In agreement with the Government it had been arranged that a company should be formed to undertake the imports, and the profits resulting from the re-sale of these dyes would be utilised to facilitate, either by the grant of subsidies or by the establishment of laboratories, the development of the dye industry in France. In addition "we have just constituted" the report states, a syndicate of manufacturers of dyes bearing the name of the *Union des Fabricants de Matières Colorantes*. The net profits in 1918 have permitted of the payment of a dividend at the rate of £2. 9s. 7d. on the old capital, and £2. 2s. 1d. on the new shares.

The Alais Works.

The report for 1918 of the *Société des Produits Chimiques d'Alais et de la Camargue* reviews at length the part taken in the production of many chemicals for war purposes since 1914 that had not previously been manufactured by the company. Strengthened by experience and the new manufactures embarked upon they could regard the future with confidence, but without concealing the serious difficulties which threatened the French industry owing to the increase in the cost of carrying out works, the rise in the price of coal and the dearth of labour. Other difficulties were specially applicable to the aluminium industry which played an important part in the company's activity. Monopolised by other military requirements the French hydro-electric works had been unable to keep pace with the development made by American producers of aluminium, and the part taken by France in the world's output had notably decreased. The situation was all the more serious as the principal market abroad for French aluminium had been Germany which would be found closed, at least for many years, to French exports owing to the construction of new works in that country and the depreciation of the mark. Notwithstanding this, confidence existed that the growing world consumption of aluminium would permit of compensation being obtained for the loss of certain markets.

The report, dealing with the various establishments, states that the work undertaken at the *Salin de Giraud* works in order to increase the production of sea salt had been stimulated in such a manner as to satisfy all the company's requirements. Favoured by exceptionally good atmospheric conditions the harvest of salt in 1918 was excellent, but the production had slackened owing to the shortage of labour. The important research work had been terminated which related to the synthesis of the derivatives of carbide of calcium and particularly of monochloroacetic acid which forms one of the important raw materials of indigo. The experiments were over and the erection of the works for actual manufacturing had been begun at Saint Auban. The aluminium works at Saint Auban were started in the autumn of 1918, although the finishing touches had yet to be completed. The net profits earned in 1918 were £260,000 and a dividend at the rate of £1 16s. per share has been declared.

The Kuhlmann Works.

The directors of the *Société Anonyme des Manufactures de Produits Chimiques du Nord (Etablissements Kuhlmann)*, reporting on the past year, state that a detailed examination shows that the damage caused by the Germans to the company's three works at Madeleine-lez-Lille, Loos-lez-Lille, and Roubaix in the North of France amounted to £560,000. In the case of the Rieme works in Belgium, which was started a few months before the war, the German efforts to completely destroy the buildings and plant on their retirement were not quite successful, and one half of the total value of £240,000 was rescued from the fire and explosions. Since the Armis-

tice the company had proceeded to re-erect the buildings destroyed and manufacturing on a small scale had been resumed. The works at Loos was about to recommence the production of chlorine and bleaching products and that at Roubaix the manufacture of sulphuric acid, but the Madeleine works had suffered the most and the production of superphosphate would only recommence next year.

After dealing with the production of articles for the purpose of national defence, agriculture, tanning and the refining of sugar, the report mentions that 1919 opened tolerably favourable for the company. The accounts submitted at the recent meeting covered the period from May 1, 1914 to December 31, 1918, and showed divisible net profits of £321,000. A dividend at the rate of 8s. per share had been paid when the share capital was £1,600,000 and a further distribution of 16s. per share has now been made on the present capital of £2,400,000.

SULPHUR ESTIMATION IN IRON AND STEEL

THE USE OF THE NEUTROSCOPE.

By MAURICE MOLYNEUX.

AT the suggestion of Mr. H. Joshua Phillips, whose original description of the apparatus appeared in the *Iron and Coal Trades Review* of January last, the writer has conducted a series of experiments with the neutroscope, using various absorption reagents, and comparing results with those obtained in various steels by the direct precipitation method with barium chloride.

In the original experiments a concentrated solution of sodium hydrate was used in the bulbs for the absorption of the H_2S evolved in the process. This was poured into a known volume of an acidulated standard solution of iodine in potassium iodide, and the free iodine remaining from the reactions titrated with standard thiosulphate of soda, using starch as indicator. It has now been found that the standard solution of iodine can be used in the bulbs, and the evolved H_2S absorbed direct without any appreciable escape of iodine, thus eliminating two reagents— $NaOH$ and the acid used for decomposing the Na_2S formed.

The following is the *modus operandi* of the direct absorption process, the reagents required being: Standard iodine solution, prepared by dissolving 3.98 grammes of pure iodine and 20 grammes of potassium iodide in distilled water and diluting to 1,000cc. (1cc. = 0.01 per cent. sulphur on five grammes); standard thiosulphate solution, prepared by dissolving 7.88 grammes of pure $Na_2S_2O_3 \cdot 5H_2O$ in water and diluting to 1,000cc. (this should be made chemically equivalent to the iodine solution by titration); starch solution, 1 gramme starch in 1,000cc. water; sulphuric acid, H_2SO_4 : 1. H_2O : 5.

In the accompanying sketch of the neutroscope an additional bulb B has been added to ensure condensation of any trace of iodine that tends to escape.

Five grammes of the steel turnings to be tested (if the sulphur is expected to be above 0.09 per cent., 2.5 grammes are weighed) are introduced into the 300cc. conical flask; 10cc. of the standard iodine solution is introduced from a graduated pipette or burette through the thistle funnel G into the bulbs C, D, E; 160cc. of the dilute H_2SO_4 are now introduced into the flask, and the rubber stopper containing the bulbs quickly fitted in. The flask is placed on the edge of a hot plate or wire gauze over a low Bunsen flame (a gentle heat below the boiling point is all that is necessary till the whole of the steel is dissolved). Soon the mixture of hydrogen, H_2S , and hydrocarbons, bubbles through the liquid, and any acid from the flask is prevented from being mechanically carried into the bulb by the device F. When the steel is seen to be all dissolved the flask is placed on to a hotter part of the plate or the temperature raised to incipient ebullition, after which it is removed and the bulbs carefully detached from the flask. During removal from the plate, the steam in the flask being condensed and producing a partial vacuum, the iodine solution is drawn into the bulb E and cannot be sucked back into the flask; and if allowed to cool gradually before detaching the bulbs all that happens is that a little

air will be sucked through the liquid into the flask. The iodine solution is poured into a 50cc. flask and the bulbs washed out two or three times with water. The standard thiosulphate solution is now gradually run in from a burette or graduated pipette until the iodine colour is nearly eliminated. A few drops of starch solution are now added, and the $Na_2S_2O_3$ run in drop by drop until the blue iodide or starch disappears. The volume thus required subtracted from 10 and multiplied by 0.01 equals per cent. S. in steel.

In addition to direct absorption with KI and I, cadmium acetate and sodium hydrate have been used, and the acidulated solutions titrated with $Na_2S_2O_3$; also bromine and HCl and $KClO_3$ and HCl ; and the sulphur precipitated as $BaSO_4$ and estimated gravimetrically, with results sufficiently accurate for steel-works practice, the direct absorption with I and KI being, however, the quickest and cheapest. The following table gives comparative results obtained with three different absorbants compared with the direct precipitation method from the iron chloride solution with $BaCl_2$ —

Steel.	Standard Iodine in Potassium Iodide	Cadmium Acetate and Ammonia.	Bromine and HCl Precipitating with $BaCl_2$.	Direct Gravimetric with $BaCl_2$.
	S. %	S. %	S. %	S. %
Semi-Steel	0.179	0.190	0.175	0.185
Electric Mild	0.021	0.020	0.018	0.024
H. C.	0.031	0.032	0.029	0.034
Mild Steel, No. 1 ..	0.057	0.054	0.053	0.059
" No. 2 ..	0.050	0.052	0.047	0.053

At first sight the apparatus appears somewhat complicated, but with a little practice it is easily manipulated, and a sulphur determination by direct titration can be accomplished within half an hour.

The makers of the neutroscope are Messrs. Wood Bros. Glass Company, of Barnsley.

ITALIAN CHEMICAL INDUSTRIES.

ACCORDING to a pamphlet on "The Economic Revival of Italy," issued by the Italian State Railways (London Office: 12, Waterloo Place, Regent Street, S.W.), the demand for chemicals in Italy before the war was very largely met by German manufacturers. The value of the imports of these products from Germany amounted to 200,000,000 lire per annum. In consequence of the cutting off of German manufactures from the Italian market as a result of the war, notable developments in the manufacture of chemicals in Italy have been made. A vast soda factory (Società Solway) has arisen at Castiglioncello in Tuscany, and a new factory for the production of caustic and electrolytic soda has been started at Piedimulera in Val d'Ossola. At Cengio, gathered round the modest nucleus of the explosives works already in existence, there is now an immense factory for the preparation of carbolic acid and various organic and explosive products. The distillation of tar has a foothold everywhere, together with the production of benzole and toluol and of coal-tar derivatives. Various Italian factories have commenced the manufacture of artificial colours, formerly imported from Germany. The output of some of the principal products of the Italian chemical industry in 1915 was as follows: Sulphuric acid, 6,259,439 quintals; phosphates and various fertilisers, 9,122,462; carbide of calcium, 491,892; calcium cyanide, 252,920; sulphate of copper, 412,720; nitric acid, 158,058; hydrochloric acid, 180,590; sulphate of ammonia, 146,989; and sulphate of soda, 141,474.

One product in which Italy holds a monopoly in Europe is Sicilian sulphur. About 400,000 tons used to be extracted before the war; but since the outbreak of hostilities, owing to shortage of labour, the estimated output in 1918 had been reduced to less than 180,000 tons. American competition, already pronounced before the war, will certainly now become more acute through the opening of new mines in Texas, which, it is affirmed, will bring the total output of the United States up to a million tons. The sulphur mines of Japan have a much more restricted importance, and the production does not surpass 50,000 tons per annum.

DUTCH EXCISE DUTY ON SALT.—By a Dutch Royal Decree, dated May 23, salt for use in factories and workshops in the preparation of fish meal intended to be used for cattle food is exempted from Excise duty.

ITEMS OF INTEREST.

IODINE.—The price of iodine was advanced on Saturday last to 1s. per oz., usual terms.

GUNCOTTON EXPLOSION.—An explosion of guncotton took place on Wednesday at Bullpoint, near Saltash, and resulted in two workmen being killed.

IMPORT RESTRICTIONS.—A revised consolidated list of import restrictions was issued as a supplement to the *Board of Trade Journal* for July 31.

OBITUARY.—Mr. Walter Valentiné Youel, for many years connected with the Carbonic Acid Gas Company, Manchester, died recently at Cheadle, Cheshire.

STRIKE OF LEAD MINERS.—A strike has taken place at Mill Close lead mines, Derbyshire, which produce about a third of the lead of the British Isles. The owners have issued notices of their intention to close down altogether unless the strikers return.

GLASS AND GLASSWARE CONTROL SUSPENDED.—The Ministry of Munitions announces that the Glass Control (Consolidated) Order, 1917 (dated September 10, 1917), and the Glass Control (Consolidation) Amendment Order, 1918 (dated May 7, 1918), have been suspended as from August 1.

ANILINE DYE INDUSTRY FOR EBBW VALE.—Mr. Fred Mills, managing director of the Ebbw Vale Company, addressing a meeting last week said that new developments were to be instituted by the Ebbw Vale Company as soon as plant was available for the manufacture of aniline dyes.

NEW ISSUES.—In view of the size of the issue, and of the unsatisfactory labour conditions prevalent while the lists were open, the offer of shares by the British Dyestuffs Corporation seems to have had a very fair reception.—Messrs. George Clare and Company announce that the issue of 250,000 deferred shares of Borax Consolidated, Ltd., has been oversubscribed.

GERMAN POTASH FOR ENGLAND.—*Reuter's* Berlin correspondent, in a message dated August 5, says: The Anglo-German potash agreement has been ratified by the respective Governments; 22,500 tons of pure potash will go to England in the next few months. The negotiations of the Potash Syndicate with the United States have not yet yielded any result.

FIRES.—Slight damage was caused by fire which broke out on Monday morning at the old works of Messrs. Levinstein, Ltd., Blackley, Manchester.—A spark from a steam wagon containing about 60 carboys of vitriol, the property of Messrs. Ormerod, Taylor and Son, Ltd., Walsden, Lancashire, set fire to the straw with which the carboys were packed, and 37 of them burst, the contents being lost.

EXPORTS TO POLAND.—The Comptroller-General of the Department of Overseas Trade desires to announce that it has been ascertained from a semi-official source that permission is not required from the Polish Government for the import of the following among other goods, chemical articles: printing and lithographic dyes, aniline dyes. Raw materials: ordinary chalk and whiting, kaolin, sand, potash, borax and raw celluloid.

CHEMISTRY AND INDUSTRY.—The report of the General Purposes Committee of the Institute of Chemistry, presented at the last meeting of the Council, states that further application has been made to the Minister of Labour to receive a few representatives for a brief conference on the problem of devising means whereby the importance of chemical science to industry may become better realised by both employers and employees and the interests of chemists themselves may be safeguarded. Representatives of the Institute have since been received by Mr. Wardle, M.P., on behalf of Sir Robert Horne, and the matter is proceeding.

TREATMENT OF MUSTARD GAS BURNS.—The free application of hydrogen peroxide to the affected parts, according to E. Rousseau and L. Devaux (*J. Méd. de Bordeaux*), quickly relieves the intense pain occasioned by contact with dichlorethylsulphide, "mustard gas" or "yperite." In half an hour the copious use of hydrogen peroxide greatly lessens the pain, and completely suppresses it in less than ten hours. The oedema shows improvement in a few hours, and disappears in six days. Since fats dissolve the mustard gas, and protect it from the action of the nascent oxygen, no ointments or oily dressings should be applied to the lesions.

THE SCOTTISH OIL COMBINE.—We understand that approximately 80 to 90 per cent. of the shareholders of the Scottish oil companies have accepted the Anglo-Persian Company's offer, but at the request of the directors of the various companies the Anglo-Persian has consented to extend the offer to August 14, so that any shareholders who have been unavoidably prevented from sending in their acceptances may still have an opportunity of doing so.

ZINC AND ZINC DUST PRICES.—No change has taken place in the quotation for Australian high grade zinc dust (88/92% metallic zinc purity) and the quotation remains at £70. per ton, f.o.r. Inquiries on this basis have been brisk, and small parcels have been sold to the continent. The price of Australian electrolytic zinc (99/95% metallic zinc) remains at £42. per ton f.o.r. Australian for direct shipment to New Zealand, India, South Africa and the Far East.

RUSTING OF STEEL.—The results of an investigation into the speed of rusting of steel containing small proportions of copper are given by Mr. D. M. Buck in a paper read before the American Society for Testing Materials. This research has determined that the principal protective effect is exerted by proportions of copper so small that most analysts would report them only as traces. Increasing the copper content from 0.01 per cent. to 0.03 per cent. decreases the corrosion by 30 to 40 per cent. With a normal sulphur content of about 0.05 per cent. a copper content of 0.12 per cent. gave virtually as complete protection as larger amounts. A copper percentage of 0.15 per cent. is considered sufficient to protect steel even with considerable excess of sulphur.

CONTROL OF POTASH COMPOUNDS SUSPENDED.—The Ministry of Munitions has issued the following announcement, dated July 31: (1) The operation of the Potassium Compounds Order, 1917, as modified by the Potassium Compounds (Partial Suspension) Order, 1919, is hereby suspended on and after August 1, 1919, until further notice. (2) Such suspension shall not affect the previous operation of the said Order or the validity of any action taken thereunder or the liability to any penalty or punishment in respect of any contravention or failure to comply with the said Order prior to such suspension or any proceeding or remedy in respect of such penalty or punishment. (3) This Order may be cited as the Potassium Compounds (Complete Suspension) Order, 1919.

COOPERAGE INDUSTRY.—The recommendations of a special sub-committee appointed by the Interim Industrial Reconstruction Committee for the Cooperage Industry to consider the question of Standardisation of Wages, etc., have been adopted by the Interim Committee to apply to the whole industry throughout the United Kingdom. Regarding wages, it is recommended: (a) That the basic rate be 1s. 9d. per hour; (b) that the towns of Glasgow, Greenock, Liverpool, Belfast, and Manchester receive 1d. per hour above such rate—viz., 1s. 10d. per hour; (c) that London and district receive 2d. per hour above such rate—viz., 1s. 11d. per hour; (d) that the weekly rate be based upon the hour rate for a maximum working week of 47 hours. The Committee therefore recommend that the trade unions confer with employers, as soon as possible, with a view to the formulation of a national piece work list of prices; and meanwhile decide that an advance of 100 per cent. be allowed on pre-war rates.

JAPANESE GLASS INDUSTRY AND RAW MATERIALS.—The Japanese glass industry has not been developed to such an extent that it is independent as regards raw materials. During the war large quantities of soda ash and other chemicals were imported from the United States, although the production of caustic soda in Japan has made rapid strides in recent years. In 1913 the production was 9,535,621 lb., valued at 465,557 yen (£46,500.), while in 1916 it was 14,852,735 lb., valued at 1,650,551 yen (£165,000.). The importation of crude caustic soda was valued at 1,310,000 yen (£131,000.) for 1913, and rose to 2,930,000 yen (£293,000.) in 1916. There are a number of factories engaged in the production of caustic soda at present, and an effort is being made to reduce the price of salt in order to enable these factories to compete with the factories of other countries. Special studies are in progress to increase the chlorine and hydrogen content of the product. With ample supplies of well-trained, cheap labour, coal, sodium silicate, and the other necessary raw materials easily accessible, the glass industry of Japan bids fair to remain prosperous and to be able to compete to advantage with the industries of other countries.

ALUMINATES OF LIME AS CEMENT MATERIAL.—The aluminates of lime, even when they contain such amounts of impurities as 16 per cent. silica and 3 per cent. iron oxide, constitute a material which the *Contract Record* claims to be a very valuable cementing medium when gauged with water. This particular value lies in the high early strengths which they develop. The greater the amount of the alumina present as an aluminate of lime, the greater will be the early strength. Under certain conditions of curing there is a marked increase of strength with age, but it does not extend over a very long period of time. It also appears that if the concrete is subjected to an excess of water during curing there will be a decrease in strength. Such amounts of moisture as are usually present in the air do not materially affect the strength. It appears, therefore, that these cements might be of considerable value for certain special uses, where the principal requisite would be quick hardening.

BENZOLE ADVISORY COMMITTEE.—An Advisory Committee has been constituted of Mr. E. S. Shrapnell-Smith, C.B.E. (chairman), Mr. D. Citroen, Mr. B. Coathupe, Major Stenson Cooke, Mr. A. W. Torkington, Mr. Walter Wolsey, and Mr. Horace Wyatt, to "advise in respect of any general matters the National Benzole Company, Ltd., may refer for assistance and suggestion; to make suggestions to the company in respect of any proposals to popularise the use of benzole by motorists and increase the consumption; and to watch the development of other home produced motor spirits and to advise the Board as to co-operation in any or all of these developments." The setting up of this Advisory Committee has been effected by the National Benzole Association acting in co-operation with the Motor Fuels Joint Committee. All communications intended for the committee should be addressed to Mr. P. G. Somerville, at the offices of the National Benzole Association, 84, Horseferry Road, London, S.W.1.

PERSONAL.—Dr. Samuel Smiles, Assistant Professor of Organic Chemistry at University College, University of London, and Honorary Secretary of the Chemical Society, has been appointed to the newly created Chair of Organic Chemistry at Armstrong College, Newcastle. His publications include "Relations between Physical Properties and Chemical Constitution" and various papers contained in the transactions of the Chemical Society and foreign societies, some dealing with organic compounds of sulphur.—The Senate of the Queen's University of Belfast have appointed Dr. A. W. Stewart to their Chair of Chemistry in succession to Professor E. A. Letts. Dr. Stewart is a graduate of Glasgow University and a son of Emeritus Professor Stewart. After studying abroad, he spent some years in research work in Sir William Ramsay's laboratory, under Professor Norman Collie, F.R.S., and was appointed Lecturer on Stereochemistry in University College, London. On the foundation of the Queen's University of Belfast, he became Lecturer on Organic Chemistry there; and in 1914 he succeeded Professor Soddy, F.R.S., in the Lectureship on Physical Chemistry in Glasgow University.

INSTITUTE OF METALS.

THE autumn meeting of the Institute of Metals is to be held at Sheffield on Wednesday and Thursday, September 24 and 25. The following is a list of the communications that are expected to be submitted: Professor P. G. H. Boswell, O.B.E. (Liverpool), on "Moulding Sands for Non-Ferrous Foundry Work"; Professor C. H. Desch, D.Sc., Ph.D. (Glasgow), Second Beilby Report on "The Solidification of Metals from the Liquid State"; Miss H. E. Fry (Teddington) and Dr. W. Rosenhain, F.R.S., vice-president (Teddington), on "Observations on a Typical Bearing Metal"; Dr. W. H. Hatfield and Captain G. L. Thirkell, B.Sc. (Sheffield), on "Season Cracking of Brass"; R. E. Leader, B.A. (Sheffield), on "The Early History of Electro-Silver Plating"; E. A. Smith and H. Turner (Sheffield), on "The Properties of Standard or Sterling Silver, with Notes on its Manufacture"; Dr. J. E. Stead, F.R.S. (Middlesbrough), on "The Ternary Alloys of Tin—Antimony—Arsenic"; Dr. F. C. Thompson, B.Sc. (Sheffield), Note on "Graphite and Oxide Inclusions in Nickel Silver"; Dr. F. C. Thompson, B.Sc., and F. Orme, M.Met. (Sheffield), on "Some Notes on the Constitution and Metallurgy of Britannia Metal."

LABORATORY CHEMICALS.

A PAPER on "The Organised Preparation of Laboratory Chemicals," by Dr. M. O. Forster, F.R.S., which was on the agenda at the recent annual meeting of the Society of Chemical Industry, was taken as read. The author's remarks, in part, were as follows:—

The resumption of normal activities by the universities and colleges will bring into prominence the pressing need of some organisation fulfilling the functions of Kahlbaum, Schuchardt, Merck, and Schimmel. Laudable attempts to meet the need are being made by certain manufacturers in this country, but they require to be amplified and co-ordinated. The field is too vast to be covered immediately by any one enterprise, or perhaps it would be more accurate to say that, as a commercial speculation, it offers too little profit and requires too much detailed organisation to attract a manufacturing company large enough to cover it. Nevertheless, it is just such a company, with an ample technical staff, and capital resources sufficiently generous to justify foregoing a satisfactory profit on this department for some years, which would best be fitted to correlate and complete the work of others.

Schuchardt's list comprised upwards of 7,000 separate items, and Kahlbaum's about 5,000. No other commercial unit is approaching this, or could approach it in ten years, but I can imagine Explosives Trades, Limited, or the British Dyestuffs Corporation establishing a branch of their organisation to deal with the subject on lines which may be roughly sketched as follows.

A census would first be made of those materials which are being produced already by separate firms, with whom arrangements would be made for their continuance, as affiliated members of the organisation, to manufacture those products, and others allied to them, for which they were best fitted by their particular resources. This would reveal the deficit, dividing itself roughly into two classes: (i.) Bulk materials obtainable from different factories in commercial form but requiring purification before distribution, and (ii.) materials not made systematically in this country. The former would be purchased from the factories in question, and would frequently constitute the starting-materials for members of class (ii.). The latter would be prepared by the staff of the Central Organisation, or, better, be divided between that staff and the university laboratories under an arrangement by which advanced students, directed by the teaching staff, would convert specified raw materials into products required by the organisation.

It is undeniable that such an enterprise would be unremunerative at first, because it involves the skilled manipulation of a very large number of very small quantities, and because a considerable proportion of capital would be locked up in stock for uncertain periods, often very protracted. It is therefore necessary to indicate the commercially compensating factors. I believe that these would develop in several directions. In the first place, successive generations of newly trained chemists would grow accustomed to inquiring for British products, and, let us hope, to satisfying their needs from domestic sources of supply. At the same time, at least a proportion of the advanced students, while still at college, would be faced with the necessity of working economically, and would gain that regard for material, time, and apparatus which they often lack on entering a factory, being in this respect a source of loss instead of profit to their employers. Then it would sometimes happen that a by-product in the bulk preparation of a commercial article could be utilised for the purpose of the retail enterprise, and a demand for this by-product would have the effect of diminishing the cost of the article itself, or of improving the methods of purification. Finally, the least easily measurable, but probably the most valuable result commercially, would be the cultivation of ideas preserved from destruction following malnutrition. This cannot fail to bring profit ultimately to the chemical manufacturer, who, when enlightened, regards ideas as one of his raw materials.

OUR BOOK SHELF.

VAN NOSTRAND'S CHEMICAL ANNUAL. Fourth Issue, 1918.

Edited by John C. Olsen, A.M., Ph.D. London: Constable and Co. 15s. net.

This excellent annual maintains its high reputation. Careful revision of all tables has been made. It is remarkable how well it keeps pace with new data. Forty-eight new tables have been added.

REPORTS OF COMPANIES.

Chemical and Metallurgical Corporation, Ltd.

The statutory meeting was held in London on July 31, Mr. Herbert Guedalla presiding.

The Chairman said: The contract with Mr. Frank Elmore has now been completed, and the corporation has acquired for the sum of £25,000, in cash and the amount of £1,000,000, paid in ordinary shares the world rights of Mr. Elmore's patented invention for the separation by an economical and efficient chemical process of the lead and zinc contents of zinc, lead ores, and concentrates. In conjunction with other parties, we are now arranging to establish a plant in this country for the purpose of the actual treatment of middlings and concentrates; and whilst we have arranged a contract for the supply of middlings from Australia—which, according to our managing director, should prove to be very profitable,—we are also in negotiation for a constant supply of the requisite raw material to keep the new works going on a proper commercial basis. As regards what I may term the foreign situation of the patents, we may roughly at present divide the geographical position into seven parts. In the first place, the Burma Corporation have an option to call for a licence in Burma and India on certain terms. This option extends to May, 1920. The option with regard to the United States of America and Canada has been exercised, and this calls for the formation of a company with a capital of £400,000., of which your corporation will receive £200,000. in fully paid shares. The option with regard to Mexico and Central America has also been exercised, and your corporation will receive 115,000 fully paid shares in a company with a nominal capital of £200,000. Another group have exercised the option with regard to Russia, Norway, and Sweden, and in this case your company will receive £150,000. fully paid shares in a company with a capital of £300,000., but it is possible that we may agree to a certain part of this capital being put up in the form of preference shares. We are completing an agreement for the establishment of a trial plant to demonstrate the process in Australia in connection with the chief mining companies there; and an agreement is almost completed with most important mining interests in France for the acquisition of the patents for France, North Africa, Spain, Portugal, etc. The option with regard to Southern Africa has not yet been exercised.

W. and H. M. Goulding, Ltd.

The net profits for the year to June 30 last, after providing for excess profits duty, and including dividends from subsidiary companies, amount to £76,915., out of which it is proposed to set aside £7,000. to cover estimated discounts on realisation of outstanding debts. This, with £4,077. from last account, leaves £73,992. available for distribution. After providing for the usual debenture interest and the dividend on the preference shares, the directors recommend a dividend of 7 per cent., with a bonus of 3s. per share, on the ordinary shares for the year, of which 3s. 6d. per share with the bonus of 3s. is payable forthwith, and the second 3s. 6d. per share at December 31 next, less tax. They further recommend that a special bonus of £500. be paid to the directors, that £5,100. (6,000 4 per cent. Victory Bonds) be set aside for the creation of a staff provident fund, that £5,000. be carried to depreciation account and £25,000. to reserve, bringing that account up to £75,000.; carried forward, £4,517.

An extraordinary general meeting will be held on August 15 for the purpose of considering and, if thought fit, of passing the following resolution: "That the capital of the company be increased to £500,000. by the creation of 30,000 ordinary shares of £5. each, ranking for dividend and in all respects *pari passu* with the existing ordinary shares in the company, and that the directors be directed to allot or otherwise dispose of the same to such persons on such terms and conditions and at such times as the directors may think fit."

British Coalite Company, Ltd., and Coalite, Ltd.

Meetings of British Coalite Company, Ltd., and of Coalite, Ltd., were held in London on Wednesday, when the resolutions for amalgamation with Low Temperature Carbonisation, Ltd., were unanimously confirmed, Mr. Henry Bacon and Mr. James Henderson Macaulay being appointed liquidators.

New Paccha and Jazpampa Nitrate Company, Ltd.

The directors have decided to offer 11,450 shares of £1. to proprietors in the proportion of one new share for every five now held, at £2. per share.

DIVIDENDS.

PRICE'S PATENT CANDLE CO., LTD.—Interim dividend of 15s. per share for half year ended June 30 and bonus of 5s. per share, less tax.

UNITED ALKALI COMPANY, LTD.—Interim dividend of 1s. per share on ordinary and 7s. per share on preference, both less tax.

PARLIAMENTARY NEWS.

Chemical Imports Committee.

In the House of Commons, Mr. Cautley asked the President of the Board of Trade whether a Committee representing the chemical industry has been appointed to advise the Board of Trade on the question of prohibition of the importation of chemicals; when such Committee was appointed and by whom; will he give the names of the members of this Committee; and whether the Proclamation issued on June 25 prohibiting the importation of chemicals of all kinds was issued under the Defence of the Realm Act?

Mr. Bridgeman: The Committee was appointed by the Board of Trade to advise the Department of Import Restrictions as to the issue of licences for the importation of chemicals, and held its first meeting on July 7. In addition to official representatives of the Board of Trade and the Ministry of Health, the following are members of the Committee: Mr. T. D. Morson and Mr. R. H. Bewick, of the Association of British Chemical Manufacturers; Mr. W. F. Reid, of the Society of Chemical Industry; Mr. E. White, of the Pharmaceutical Society; Mr. T. E. Lescher, of the Drug Club; and Mr. W. Mann, of the British Chemical Trades Association. The Proclamation, like other Prohibition of Import Proclamations, was issued under Section 43 of the Customs Consolidation Act.

Control of Water Power Resources.

Sir Robert Thomas asked the President of the Board of Trade whether he is yet in a position to state if it is his intention to introduce a Suspensory Act to prevent industrial concerns, at the expense of the community, obtaining control of the water resources of Wales until the whole question can be carefully considered and brought in under the reconstruction scheme which the Government have in view to develop the water resources of the country generally; and whether the Aluminium Corporation, Ltd., have still the power to dam up Lake Cowlyd, which authority was given to them in order to increase the output of aluminium for the purposes of the war?

Sir A. Geddes: I am considering the question of introducing legislation of an interim character providing for the control of water-power developments. The answer to the latter part of the question is that the Aluminium Corporation have applied to the Board of Trade for an Order, under the Special Acts (Extension of Time) Act, 1915, to extend for one year the period of three years fixed by the Conway and Colwyn Bay Joint Water Supply Board Act, 1916, for the completion of the dam of Lake Cowlyd. Notice of this application has been advertised, and objections to it should have been sent to the Board of Trade on or before August 2.

Pembrey Factory.

Mr. Wignall asked the Parliamentary Secretary to the Ministry of Munitions whether he has received the report of Mr. Charles Doughty, dated June 23, 1919, relative to the difficulties at the National Filling Factory, Pembrey; and what steps he has taken to secure the carrying out of the recommendations made therein?

Mr. Kellaway: This report has been under consideration by the Ministry of Labour, at whose suggestion the inquiry at Pembrey was held. The position has been complicated by other questions concerning general male labour which have arisen since the date of the Conference. The agreement regarding shift-workers has been ratified, and the factory management have been authorised by wire to make retrospective payment to the men concerned. Regarding the settlement reached in the case of Mr. John Bevan, instructions to the factory to carry out the terms of Mr. Doughty's report have been despatched.

Utilisation of Peat.

Mr. Macpherson, in reply to Sir Maurice Dockrell, said: The Irish Peat Inquiry Committee appointed by the Fuel Research Board to inquire into the problem of the utilisation of peat have presented their report, which is now under consideration by the Government. There is no evidence as to the existence in Ireland of natural oil in paying quantity.

Chemists' Salaries.

Mr. Sitch, on Tuesday, asked the Parliamentary Secretary to the Ministry of Munitions whether he is aware that a request was made to the Department to sanction an increase of salary to the chemists employed in His Majesty's factory, Oldbury; whether this request was refused; and, if so, will he state the reason?

Mr. J. Hope: I am informed that the request was refused on the ground that the chemists employed at His Majesty's factory, Oldbury, were at least as well paid as chemists employed at other Government factories, and that it was impossible to consider the case of a single factory apart from the general question of the salaries paid to all chemists and other technical officers in the employment of the Government.

Mr. R. Young asked the Parliamentary Secretary to the Ministry of Munitions whether he is aware that amongst the chemists employed in explosive factories who signed the memorial praying for a revision of salary there were at least 100 associates and fellows of the Institute of Chemistry; whether the work done by these chemists in developing and maintaining the output of some of the most indispensable munitions of war has been recognised; whether he is aware that the memorialists were informed that the question of principle raised in the memorial could not be admitted by the Ministry, that the salary of the chemists could not be compared with the earnings of tradesmen, and that the Ministry objected to meetings being held by any section of the staff of factories under their control to pass resolutions asking for a revision of salaries and appointing deputations to wait upon the superintendent in respect thereof; whether this statement was made with his sanction; and, if so, will he state the reason?

Mr. Hope: I see no reason to doubt the suggestion in the first part of the question. I fully recognise the admirable work done by chemists in developing and maintaining the output of munitions. The statement mentioned in the third and fourth parts of the question were made by an officer of the Department, but must not be taken to express the considered view of the Ministry. I hope to make a more complete statement on this subject on Thursday in answer to the hon. member's question.

Cellulose Inquiry.

Mr. Raper asked the Prime Minister when Lord Sumner's report on the cellulose inquiry will be forthcoming?

Mr. Bonar Law: It is hoped that the report will be in the hands of my right hon. friend the Chancellor of the Exchequer in the course of a few days.

Mr. Lambert: Will the report be in the hands of members as well as the Chancellor of the Exchequer?

Mr. Bonar Law: Oh, yes.

British Dyestuffs Corporation.

Sir Philip Magnus, on Wednesday, asked the President of the Board of Trade whether the £850,000. of 7 per cent. preference shares and £850,000. of 8 per cent. preferred ordinary shares in the British Dyestuffs Corporation subscribed by His Majesty's Government represented new money, or whether they had been allocated in consideration of the £1,142,000. loaned by the Government at 4 per cent. to British Dyes, Ltd., one of the amalgamated companies.

Sir Auckland Geddes said: His Majesty's Government were under obligation to advance to British Dyes, Ltd., on certain conditions a maximum sum of £1,700,000. secured by debenture bearing interest at 4 per cent. per annum. The amount advanced under that obligation had been repaid, and His Majesty's Government had subscribed instead for £850,000. 7 per cent. preference shares and £850,000. preferred ordinary shares in British Dyestuffs Corporation, Ltd., which had been formed to amalgamate the undertakings of British Dyes, Ltd., and Levinstein, Ltd.

Anglo-Persian Oil Company.

Mr. Lambert asked the First Lord of the Admiralty what amount the Government invested in the Anglo-Persian oil-field, and what was the market value of that investment to-day?

Mr. Long said the Government held ordinary shares £2,000,000.; participating preference shares £1,000.; debenture stock £199,000. It was not possible to give any accurate estimate of the present value of the investment, as there was no Stock Exchange quotation for the ordinary shares. It was, however, undeniable that their value had considerably appreciated, and could not be judged merely by the dividend at present paid.

NEW COMPANIES.

Crepin and Doumin, Ltd.—Private company. Capital £5,000., £1. shares. Wholesale and retail manufacturers of essences, perfumes, oils and light fluids of all kinds, perfumers, chemists, druggists, dyersalters, oil and colourmen, importers, manufacturers of pharmaceutical, medicinal, chemical, industrial, and other preparations, etc. Registered office: 15, Cooper's Row, E.C.

Edward G. Annelly and Co., Ltd.—Private company. Capital £5,000., in 4,500 $\frac{1}{2}$ per cent. cumulative part preference shares of £1. each and 2,000 ordinary shares of 5s. each. Dyersalters, oil and colourmen, and manufacturers of and dealers in chemical, industrial, and other preparations. Registered office: Trafalgar Lane, Sheffield.

Este Syndicate, Ltd.—Private company. Capital £1,200., in 1,185 ordinary shares of £1. and 300 founders' shares of 1s. each. Object: To search for petroleum and other minerals, oils, etc. Office: Talbot House, 9, Arundel Street, W.C., 2.

Excel Products Company (Cardiff), Ltd.—Private company. Capital £5,000., £1. shares. Neatsfoot oil manufacturers, soap and fat boilers, etc. Registered office: 2, Church Street, Cardiff.

Fred Chester's Fertiliser Company, Ltd.—Private company. Capital £500., £1. shares. Office: 13, Hamilton Square, Birkenhead.

Grove Metal Refining Works, Ltd.—Private company. Capital £2,000., £1. shares. Registered office: 5, Fen Court, E.C.

George Lillington and Co., Ltd.—Capital £50,000., £1. shares. Object: To take over the business of George Lillington and Co., Ltd., within the United Kingdom only, as manufacturers of "metallic liquids" or any preservatives for stone, cement, wood and other materials, etc. Registered office: 40, Holborn Viaduct, E.C. 1.

Associated Nigerian Tin Mines, Ltd.—Private company. Capital £275,000., 5s. shares. Solicitors: Hays, Roughton and Dunn, 11-12, Clements Lane, E.C.

Blackmore, Howard and Motherell, Ltd.—Private company. Capital £20,000., £1. shares. Gold, silver, and platinum refiners and assayers. Registered office: 6, Bishopsgate, E.C.

British Dominions Oil Corporation, Ltd.—Private company. Capital £100., £1. shares. Solicitors: Ashurst, Morris, Crisp and Co., 17, Throgmorton Avenue, E.C. 2.

British Mexican Petroleum Company, Ltd.—Private company. Capital £2,000,000., in 1,000,000 ordinary series "A" and 1,000 ordinary "B" shares of £1. each. Agreement with the Huasteca Petroleum Company. Solicitors: Norton, Rose and Co., 57 $\frac{1}{2}$, Old Broad Street, E.C.

Craven Lime Company, Ltd.—Private company. Capital £42,000., £1. shares. Object: To take over the business carried on by the Craven Lime Company, Ltd. (in liquidation), at Ingelton, Ribbleshead and Langcliffe, near Settle, Yorks. Registered office: Langcliffe, Settle.

Mawson Co., Ltd.—Private company. Capital £20,000., £1. shares (10,000 preference). Manufacturers of and dealers in all kinds of photographic dry plates, films and papers, photographic chemicals, collodions, collodion emulsions and varnishes, etc. Registered office: 81, Northumberland Street, Newcastle-on-Tyne.

Middlesbrough Metal Company, Ltd.—Capital £10,000., £1. shares. Registered office: James Street, North Armesby, Middlesbrough.

Peak Mining and Mineral Company, Ltd.—Private company. Capital £2,000., £1. shares. Registered office: Mountain View, Smedley St. East, Matlock.

J. C. Bottomley and Emerson, Ltd.—Private company. Capital £30,000., £1. shares. Manufacturers of chemical, coal tar dyestuffs, intermediates and products, tar distillers, etc. Office: Brookfoot Works, Brighouse.

Quebec Graphite Company, Ltd.—Private company. Capital £40,000., £1. shares. Object: To take over the business of the New Graphite Company, Ltd. (in liquidation). Solicitors: Bristows, Cooke and Carpmal, 1, Copthall Buildings, E.C.

S. Bowley and Son, Ltd.—Private company. Capital £50,000., £1. shares (20,000 preference, 24,000 "A" ordinary, and 6,000 "B" ordinary). Oil importers, refiners, etc. Office: Wellington Works, Wellington Road, Battersea, S.W.

South Phoenix Tin Mine, Ltd.—Private company. Capital £20,000., 10s. shares. Registered office: 27, Old Jewry, E.C.

Clydesdale Chemical Company, Ltd.—Private company. Capital £8,000., £1. shares. Registered office: 36, East Nelson Street, Glasgow.

THE PATENT LIST.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Devulcanising Waste Rubber. D. Spence, Norwalk, Connecticut, U.S.A. British Patent, 126,397, of 1917.

Rubber is devulcanised by treatment with a vulcanising accelerator in the presence of a reagent capable of removing the sulphur as it is liberated; this reagent may be in excess of the accelerator. Preferably, uncombined sulphur is first removed; the rubber should be in a finely divided state—for example, in solution,—and no moisture should be present. A temperature of 170 to 180° C. is preferable. According to an example, the rubber may be dissolved together with metallic sodium or potassium in aniline, heated for several hours, and the aniline, etc., removed; or the rubber may be dissolved in xylol and treated with anhydrous caustic alkali. Other examples of vulcanising accelerator mentioned are piperidine, paramido-dimethyl-aniline.

Dearsenication of Sulphuric Acid. A. E. Waring and United Alkali Company, Ltd., Liverpool. British Patent, 126,714, of 1917.

Sulphuric acid is freed from arsenic by treating with sulphuretted hydrogen, and the arsenious sulphide is separated by agitating with a liquid hydrocarbon such as paraffin oil to form a scum, separating the scum, washing it till free from sulphuric acid, dissolving the arsenious sulphide in sodium hydrate, carbonate, or sulphide, and separating the hydrocarbon from the thio-arsenite solution. The mixture of

acid, sulphide, and oil is passed from a mixer into a trough A, the scum being removed by combs C on endless chains e, and carried up an inclined shelf B to an inclined trough D having baffles d in the form of lateral troughs. The outlet a² for the purified acid is below the shelf B; the scum is washed by water sprays E, F, the latter being over a perforated plate d¹ covering the outlet d². The washed scum, separated from the washing-water, is treated as above described for the recovery of the oil and the production of thio-arsenite.

Permanganates. H. C. Jenkins and H. Woolner, London. British Patent, 126,756, of 1918.

Manganese dioxide, or manganese oxide recovered from the process, is fused with excess of soda with or without an oxidising-agent such as sodium chlorate and with or without some potash. The melt is dissolved in water or mother-liquor from the process and filtered, preferably through biscuit porcelain—or, according to the Provisional Specification, through asbestos,—and the filtered solution is electrolysed to obtain permanganate, nickel anodes, iron cathodes, a voltage of 4 volts, and a temperature of 20-30° C. being mentioned. A potassium compound, such as caustic potash or potassium carbonate or chloride, is then added to cause the separation of potassium permanganate. The mother-liquor is concentrated to cause some sodium chloride to separate, and may be evaporated to dryness, the residue being used in a fresh melt.

Ammonium Nitrate. F. A. Freeth, Great Crosby, Lancashire; and H. E. Cocksedge, Herne Hill, London. British Patent, 126,678, of 1917.

Ammonium nitrate is obtained by preparing a solution saturated with ammonium nitrate, sodium nitrate, and sodium sulphate at a selected temperature, adding enough water to keep the sodium salts in solution at a selected lower temperature, and then cooling the diluted solution to that temperature when ammonium nitrate separates out. The mother-liquor is then concentrated until the added water has

been removed, and quantities of ammonium sulphate and sodium nitrate equivalent to the separated ammonium nitrate are then added; the whole being maintained at a temperature not lower than the original selected temperature. Sodium sulphate separates and is removed, and the whole series of operations can then be repeated indefinitely.

Evaporating Liquids. J. J. Hampson, Leyton, London. British Patent, 127,073, of 1918.

An apparatus for evaporating easily-decomposable solutions, such as sugar and various chemicals, comprises a series of narrow troughs A open to the atmosphere, and heating-pipes C laid loosely therein with flexible or detachable connections to the outside of the troughs so as to be capable of being lifted completely clear of the liquor in the troughs for cleaning purposes. Steam is passed through the pipes C in the opposite direction to the flow of liquor

through the troughs A. Pairs of troughs and their steam-pipes may be coupled together, as by pipes D, E respectively.

Nitric Acid. E. B. Maxted, Walsall, Staffordshire. British Patent, 127,343, of 1917.

The gaseous product of the oxidation of ammonia is treated by fractional condensation, the first being at temperatures of 50-100° C., for instance 60° C., and the subsequent condensations at temperatures below 0°, for instance -10° C. The condensates are separately concentrated by evaporation as far as possible, the constant boiling-point acid obtained by evaporation being strengthened by liquid nitrogen oxides in the known manner.

Neutral Sulphate of Ammonia. N. Wilson, London. British Patent, 127,398, of 1918.

Neutral sulphate of ammonia is obtained by directly neutralising the acid present in the crude crystals by treatment with a cold ammoniacal solution of sulphate of ammonia, saturated or practically saturated with this salt, the degree of alkalinity of the solution being sufficient to neutralise the acid in the crystals and not substantially below 1 per cent. of free ammonia. A suitable apparatus for carrying out the process comprises an ammonia generator C, collectors D for pure ammonia solution, a drying apparatus B—for example, a centrifugal,—a tank E in which the ammoniacal sulphate of ammonia solution is prepared, and a second tank F into which the liquid from the tank E is pumped and from which

it flows by a pipe H and rubber hose J to the dryer B. The ammoniacal sulphate of ammonia solution is prepared by placing acid sulphate of ammonia—for example, drainings from sulphate of ammonia plant—in the tank E, and running in pure ammonia solution from the vessels D. In a modified form of apparatus, the dryer B and tanks E, F are mounted on a vehicle, and a prime-mover—for example, a steam-engine—is provided which may be connected to the wheels of the vehicle or to the dryer; the vehicle also carries a tank containing pure ammonia solution for use in preparing the ammoniacal sulphate of ammonia solution. The neutral sulphate is discharged from the dryer into a sack carried by a weighing-machine, which cuts off the discharge when the sack contains a predetermined amount.

Sulphuric Acid. G. Taylor, Rotherham; and E. K. Scott, Farningham, Kent. British Patent, 127,047, of 1917.

In the chamber process of making sulphuric acid, air-borne nitrogen oxides are employed, such as those produced by passing air through flame arcs or a Kilburn-Scott three-phase alternating-current electric furnace, or, according to the Pro-

visional Specification, the gases produced by oxidising ammonia, diluted with large volumes of air, or the air-borne oxides of nitrogen produced by ozonising. The gases may be admitted to the pyrites burners to form part of the combustion air, or to the gases coming from the burners, or to the gases leaving the last sulphuric-acid chamber.

Concentrating Sulphuric Acid. J. S. Morgan, Freshfield, Lancs. British Patent, 127,652, of 1917.

Apparatus for concentrating sulphuric acid and other liquids consists of a tower or chamber containing basins E, Fig. 1, provided with lips F, and so arranged that the acid drips from basin to basin, and is at the same time exposed to the action of products of combustion or hot air or other gases passing up the tower. The basins act as baffles causing the gases to take a circuitous path, and are mounted on skeleton

supports M, N so that the hot gases can pass below the basins and up all round them. In order to obtain access to the interior of the tower, one or more of the sides O is formed of plates which are fixed but removable, consisting, for example, of slabs or cast-iron plates cemented in position. In a modified apparatus, Fig. 2, alternate basins P are annular in form, the basins E being centrally mounted, and each of the pans is formed with a number of lips Q.

Hydrogen. J. Harger, Liverpool; and H. Terry, Bishops Waltham, Hampshire. British Patent, 127,609, of 1917.

In separating carbon monoxide from hydrogen or gases containing hydrogen, oxygen or air is added, and the mixture is passed over a catalyst at a comparatively low temperature (100-300° C.) so that the carbon monoxide is oxidised, but not the hydrogen. Suitable catalysts are metals such as copper or nickel, or oxides of copper, iron, chromium, aluminium, nickel, lead, mercury, bismuth, cerium, thorium, manganese, cobalt, or zinc. Mixtures of oxides may be used and may be obtained by mixing the hydroxides or salts, such as nitrates, oxalates, etc., distributing the mixture on a combustible or other base, and igniting. In the case of gases containing carbon dioxide, steam is preferably added before the reaction. Sulphuretted hydrogen is preferably removed. Oxygen for addition to the gaseous mixture may be obtained by electrolysis, and added alone or together with the electrolytic hydrogen.

Tar Distillation. J. Archer, Stockton-on-Tees. British Patent, 123,880, of 1918.

A still for wet tar consists of a shallow flat-bottomed chamber *g* having fins *g'* conducting heat from the bottom of the still into the body of the tar, and partitions *g''* which impart a zig-zag path to the tar flowing through the still. The depth of the tar in the still is 4 in. to 6 in. The crude tar is lifted to a storage tank heated by a steam coil, and is preheated on its way to the still by the pitch discharged from the still. The pipe conveying the tar from the storage tank to the preheater is warmed by an internal pipe through which the water from the steam coil in the storage tank is led.

The vapours are led to a condenser; the gases that escape condensation are conveyed to the furnace which heats the still.

Extracting Lead and Zinc. F. E. Elmore, Boxmoor, Hertfordshire. British Patent, 127,641, of 1917.

Lead and zinc are extracted and separated from ores, concentrates, and the like, in which these metals occur together as sulphides, by heating with an acid agent which converts the lead into a soluble compound, whilst the zinc sulphide remains substantially unattacked. The acid agents used are sulphuric acid alone, or a solution of a suitable salt to which has been added either sulphuric acid, hydrochloric acid, or

an alkali bisulphate. Suitable salts are sodium chloride, ammonium chloride, or other halogen salt, other than that of a heavy metal, capable of acting in solution as a solvent of lead sulphate or chloride. When sulphuric acid is used alone, the product is treated with a hot strong solution of sodium chloride or other suitable halogen salt, which, on cooling, deposits lead salts. In all cases the solution, after deposition of lead salts, may be reheated and used again. To avoid the evolution of sulphur dioxide or sulphuretted hydrogen during the process, separate batches of ore, etc., may be treated with strong and somewhat weaker sulphuric acid, the sulphur dioxide from the strong-acid batch being led into the weak-acid batch, when sulphur is precipitated. When lead chloride is produced, it may be converted into sulphate by heating with strong sulphuric acid, the hydrochloric acid evolved being absorbed in water or brine for reuse. The lead sulphate produced may be smelted with lead sulphide in known manner, the lead sulphide being produced by utilising the sulphuretted hydrogen evolved from the treatment of the ore with hydrochloric acid and a salt solution. According to Provisional Specification 11348/17, hydrochloric acid alone may be used as the acid agent, the lead chloride being extracted by boiling with water or brine.

Nitro Compounds. J. G. Baxter, Gravesend, Kent. British Patent, 125,160, of 1916.

Picric acid is prepared in a continuous manner by nitrating phenol or its sulphonic acid by means of mixed acid in the apparatus shown. The vessel 1, Fig. 1, is provided with cooling-coils 5, 6, and an agitator 4, and is divided into two compartments by an annular wall 10; the vessel is partly filled with mixed acid and phenol sulphonic acid, and the two liquids are then continuously run in at suitable rates through funnels 2, 3; the reaction mixture flows through the inner compartment through passages 11 in the bottom of the annular wall 10 into the outer compartment. From here they flow away by a spurt 7 to the vessel shown in Fig. 2, entering by the opening 16 and flowing under and over obstructions 19 . . . 25, and flowing out by the exit 17. The vessel shown in Fig. 2 may be heated or cooled by running hot or cold water over it, and may be suitably tilted to vary the rate of flow of the reaction mixture through it. Cresol or toluene—or, according to the Provisional Specification, benzene—may be nitrated in a similar way.

Treating Gases with Liquids. T. W. S. Hutchins, Electro Bleach and By-Products, Ltd., Middlewich, Cheshire. British Patent, 124,045, of 1918.

Relates to drying or absorbing a gas by liquid flowing in the opposite direction. In the apparatus shown in Fig. 6, the gas flows horizontally through a chamber *a* over a series of baths *b* separated by weirs *q* and perforated partitions *r*. The liquid is sprayed up in front of each partition by a portion of the gas distributed to transverse pipes *n* carrying immersed nozzles. Shown larger in Fig. 5, a nozzle is seen to consist

of a blast nipple *n*¹ within a cone *o* to which the liquid has access through an aperture *p*. Fig. 2 shows two of a series of baths *b* which are arranged stepwise. A conduit *h* fitting the junction *i* just dips into the lower bath and leaves an annular space above and below the junction. The gas passes from the lower annular space over the liquid to the upper annular space through perforations, and an immersed nozzle *n* throws up sprays within the conduit. The sprayer is supplied with a portion of the gas treated.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Sulphonic Acid. Barrett Company, New York, U.S.A. British Patent, 126,943. Convention date, May 13, 1918.

Mixtures of sulphonic acids and sulphuric acid, obtained by sulphonating aromatic hydrocarbons, etc., are separated by distilling off the sulphuric acid under high vacuum, the temperature being kept below that at which the sulphonic acid decomposes. The process may be applied to benzene disulphonic acid, the sulphuric acid being distilled therefrom at a pressure of lin. or less and a temperature of about 260° C. Using the apparatus shown, the mixture of acids is run into a still 3, in which a high vacuum is maintained by the pump 10; the still is heated by a jacket 4. The sulphuric acid distills off to a condenser 12, and the sulphonic acid is then drawn off into the tank 14 and neutralised with soda, etc. The process may be employed in conjunction with that described in Specification 122,169, the water produced in the sulphonation process being distilled off *in vacuo*, and then a higher vacuum applied to distil off the sulphuric acid.

Alkali Compounds from Silicates. E. Bergve, Nottoden, Norway. British Patent, 127,566. Convention date, May 27, 1918.

Alkali aluminosilicates—for example, potash feldspar—are decomposed by treating at a high temperature with sulphur vapour or with sulphur vapour mixed with sulphur dioxide. Products termed oxy-sulpho-silicates and sulpho-silicates are stated to be formed by the successive replacement of the oxygen of the potash, alumina, and silica by sulphur as the temperature is raised. These products may be decomposed by water under pressure and at a high temperature to give solutions of alkali, or they may be decomposed at ordinary temperature and pressure by weak acids.

Lithopone. P. Desachy, Paris. British Patent, 126,626. Convention date, October 19, 1917.

A mixture of barium sulphate and zinc sulphide is prepared by mixing together a solution of zinc sulphate and a solution of an alkali or such salt of an alkali metal as will produce an insoluble zinc salt, such as a sulphite, and then acting upon the resulting zinc hydroxide or zinc sulphite concurrently

with its formation by a solution of barium sulphide, from which a portion of the barium has been previously separated in the form of carbonate by treatment with carbonic acid. The zinc sulphate and alkali or sulphite solutions are brought to boiling-point in the tanks *a* and *b* respectively, and discharged into the mixing-tank *m* with continued heating. As soon as precipitation begins, the

barium sulphide solution is run in from the tank *c*, tests being made on the mixed liquor with lead carbonate paper to avoid employing excess of sulphide. The mixed precipitate of zinc sulphide and barium sulphate is preferably dried at 100° C., and calcined at about 850° to 900° C.

Hydrogen Manufacture. Compagnie Générale d'Electro-Chimie de Bozel, Paris. British Patent, 127,018. Convention date, November 17, 1915.

Hydrogen is prepared by reacting upon silicon or aluminium or compounds of these elements, with water containing an alkaline-earth base such as lime or baryta, and a small proportion of alkali, or alkali salt such as carbonate, acid or neutral sulphate, phosphate, sulphite, or hyposulphite.

Treating Mercury. G. B. Perez, Alicante, Spain. British Patent, 126,961. Convention date, May 15, 1918.

It is stated that gold and radium are obtained by the decomposition of mercury in Crookes's tubes by the action of radio-activity.

Recovering Volatile Solvents. A. Daniel and J. H. Bregeat, Paris. British Patent, 127,309. Convention date, July 8, 1916.

Alcohol, ether, or acetone are recovered from gaseous mixtures containing them—for example, in the manufacture of artificial silk, explosives, or artificial leather—by absorption in phenol or its homologues—*e.g.*, crude cresols,—and subsequent distillation and condensation. Using the apparatus shown, the vapours are washed by a counter-current of cresols

in washers *B*¹, *B*², *B*³; the cresol charged with alcohol, etc., is pumped to a reservoir *R*², and passes through a heat-exchanger *D* to a steam heater *E* and still *F*; the vapours liberated in the vessels *E*, *F* are condensed in the condenser *G* and flow to a separator *H*; the cresol returns through the heat-exchanger *D*, cooler *I*, and vessel *J* to the tank *A* for reuse. Instead of cresols, mixtures containing them may be used.

Recovering Volatile Solvents. F. I. du Pont, Wilmington, U.S.A. British Patent, 126,682. Convention date, January 4, 1917.

In recovering solvent, such as alcohol and ether,

from smokeless powder, etc., the powder is heated by air or vapour passed in a circuit comprising a container *a* for the powder, a pump *b*, and a heater *c*. Vapours evolved from the heated material escape through a side tube *i* to a condenser *k*. The circulating air or vapour is kept preferably at a temperature between the boiling-points of ether and alcohol,

Extraction of Metals. Norsk Hydro-Elektrisk Kvaestofaktieselskab, Christiania, Norway. British Patent, 126,951. Convention date, May 15, 1918.

Ores are reduced by carbonic acid which is obtained from carbon dioxide by interaction with a metallic sulphide according to the equation: $\text{FeS} + 3\text{CO}_2 = \text{FeO} + 3\text{CO} + \text{SO}_2$. The sulphide is heated in a container 1, and carbon dioxide

is blown in from a pipe 2 connected with the reduction chamber 8. The sulphur dioxide is removed in scrubbers 4, 5, and the carbonic acid enters a holder 6, from whence it flows to the reduction chamber.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of soda.—Full particulars of the July shipments from Chili are not available at the time of writing, but as only 7,400 tons were exported in the first half of the month the total will not have been large; a few steamers having been chartered at high rates for early loading, an increase in shipments will probably be seen this month, with a further considerable expansion towards the end of the year when British tonnage is released for the nitrate trade. There is nothing doing on this side in the fertiliser, as it will not be wanted for application to the land until next spring, but chemical manufacturers are required to pay high prices in the open market; they might well be supplied on reasonable terms by the Ministry of Munitions in return for the great services rendered during the war. Some business is passing in Chili, chiefly by German sellers to American buyers, the prices varying from 8s. 7d. per quintal, f.o.b., for ordinary nitrate early delivery to 9s. for refined, 1920 shipments. These figures are far below those fixed by the Producers' Association referred to in our last issue.

French Synthetic Ammonia Departure.—A company called the Société d'Etudes de l'Azote has just been formed with a capital of 1,500,000 francs for the purpose of acquiring patents, licenses and processes for the production of synthetic ammonia. The offices are in Paris, at the Rue de Miromesnil, 16. The list of promoters of this company embraces some of the best known names in French industry.

Italian Fertiliser Prices.—Prices for fertilisers in Italy are as follows:—Mineral superphosphates, 14-16 per cent., 137 lire; bone superphosphate, 1-1½ per cent. nitrogen, from 3 to 3.40 lire per unit on wagon at Genoa; basic slag, 12-14 per cent. phosphoric anhydride, 30 lire; nitrate of soda, prompt, 94 lire; sulphate of ammonia, 20-21 per cent., 138 lire; degelatinised bones in powder, 16-16.50 lire, all per quintal.

Dutch East Indian Nitrogen Prospects.—An extensive search has been made in the Dutch East Indies for water power for electrical purposes. The result to date has been very encouraging, whilst the search continues. It is anticipated that by the end of the year about 2,000,000 H.P. will have been added to the known motive power of the Dutch East Indies, so that, as a Dutch journal observes, as far as water power is concerned, the possibility of establishing great nitrogen fertiliser concerns on as great a scale as in Scandinavia is placed beyond doubt.

Lack of Fertilisers for Russian Sugar.—Advices from Russia show that the sugar industry has a very sorry future before it on account of many causes, amongst which special mention is made of the complete absence, or nearly so, of any kind of fertiliser—either natural or artificial. The want of superphosphates is particularly felt. In fact the fields generally are being allowed to fall into a very backward condition.

Sulphate of Ammonia.—Export prices for this material show some irregularity, but the home demand is active. Although the present price is a higher one than British users have been accustomed to pay for a good long time now, the quotation is recognised as being comparatively low. The latest advices from the other side of the Atlantic state that conditions in sulphate of ammonia continue along the same steady lines that have been noted for some time past. Whilst there has been an absence of any trading in large quantities, sufficient business is passing to keep market prices firm.

Basic Slag.—The market in this material is brisk, and works are reported to be full of orders from those who desire to participate in the rebate for August delivery. So active is the demand, in fact, that it is said that the current output will be insufficient to cover these wants. At the same time those who may not be fortunate enough in getting deliveries will have the satisfaction of knowing in due course that their turn will come in the early autumn by the time they propose applying it. Supplies of higher grade slag are certainly limited. There is talk of a further rise in slag prices despite some increase in the make. Manufacturers' costs are undeniably heavy and buyers are getting such good prices for their own produce that it is said they should not mind paying a little more for this valuable fertiliser.

Superphosphate.—Prices for superphosphate are to be advanced after the August deliveries. The amount of material available does not appear to be as large as was expected and the limitation is making itself felt.

Potash.—There does not seem to be very wide trading in potash salts at present and prices, apparently, appear to be regarded by cultivators as high. The quotation of £40. 10s. is now mentioned for sulphate of potash, whilst nitrate of potash is at a figure that apparently precludes any possibility of use as fertiliser. American potash producers are still asking for protection against the feared foreign competition. Alsatian potash is reported to be now arriving more plentifully in the United States.

Other Fertilisers.—Holiday dulness has marked the trading in most other sections. Bone meal is firm, values being as last recorded, which means about £15. 10s. for East Indian meal, with lower figures for inferior grades down to about £9. 10s. There is no business doing in foreign tannage owing to the absence of supplies, and quotations are purely nominal. The same remarks may be applied with regard to the present position in dried blood.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

Outputs of tinplates are slightly increasing, but the position is such that there is not much regularity in booking orders owing to the various disputes in the coalfield and also at many of the steelworks. It is a matter of great difficulty for the manufacturers to quote for any orders the execution of which would take some time to complete. Inquiries for plates are numerous and there is a great demand from the packing centres.

Operations have been resumed at the oxalic acid works of Messrs. Pritchard, Port Tennant, Swansea. A few weeks ago owing to some dispute with the plumbers work was suspended indefinitely or rather until the stocks of acid were reduced. Although there has been a somewhat better request for oxalic acid the prices have slightly fallen during the last few weeks, but there are indications that business will be much better in the near future. The Port Tennant factory is the oldest oxalic acid works in the country, and during the stoppage many important repairs and improvements have been made.

Those engaged in the patent fuel trade had only a short holiday, the demand for briquettes being so heavy, especially from foreign customers. Cargoes were dispatched from Cardiff to St. Nazaire, Rouen and Morlais. The Swansea shipments were above the average and included cargoes for Naples, Casa Blanca, Buenos Ayres, and Alicante.

So far there has been no damping down of coke ovens at Ebbw Vale but the position, owing to the stoppage of the furnaces, has now become acute and there is yet no prospect of the works being restarted in the immediate future. Other coke ovens are working regularly and the yields of sulphate of ammonia are being fully maintained at present.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

The outlook has brightened somewhat this week, rail makers on the West Coast having succeeded in booking orders which, if the labour situation allows, will enable them to keep their rolling mills in operation for some months to come. It is obvious, therefore, that there can be no immediate reduction of output of ordinary iron, and in that case, of course, the by-product coke ovens will continue to work if only at two-thirds of their capacity. It is still hoped, however, that there may yet be forthcoming such a pressure on steel-makers here as to compel an increase in the make of ordinary iron. The practicability of that step depends, again, upon output at the iron-ore mines and upon imports of Spanish ore. At present both sources of supply are below normal. It has been difficult this week to get sufficient coal for the coking plants on account of the holidays, and if work was not resumed at mid-week it was feared that there may be a shortage next week. The make of by-products has fluctuated slightly, but, except as regards benzole and sulphate of ammonia, the whole production of which is fully absorbed, it is in excess of demand. Creosote is being shipped at Maryport for Spain, and a good deal of it is going to home users. Pitch is fairly firm, but there are considerable stocks to dispose of yet. The chemical works here have no market for pyridine, and naphthalene is in but slight demand.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W.1, whence further information may be obtained:—

Belgium.

An agent in Liège desires to secure an agency, with depot, for the sale of industrial chemicals and pharmaceutical products. The inquirer has specialised in the study and analysis of chemical products. (Reference No. 212.)

A Belgian inquirer desires an agency, in Belgium, for United Kingdom firms dealing in pharmaceutical, veterinary, and industrial chemical products, and optical, photographic, and scientific instruments and material. (Reference No. 229.)

A Belgian-born subject, with showroom and store in Brussels, and travellers throughout Belgium, North of France and Luxembourg, desires to secure agencies for fine chemicals and drugs, varnishes, cold glues, etc. (Reference No. 231.)

H.M. Consul-General at Antwerp has forwarded a supplementary list of Belgian firms (buyers and agents) desiring to establish business relations with United Kingdom manufacturers of the following goods:—

GOODS REQUIRED.

Heavy chemicals; starch and dextrine, grinding, mixing and crushing material for making plant, oil for paint, linseed oil, arachide oil, chemicals, drugs, perfumery, optical goods, fertilisers, oils (vegetable), leather scrap, bone powder, all kinds of guano, and sulphate of ammonia, anti-corrosive and anti-fouling compositions, lead, tin, and tin plate.

AGENCIES DESIRED.

Chemicals, paint and varnish, ultramarine blue, extracts for tanners and dyers, white-lead and linseed oil, soft pig lead, antimony.

Communications in connection with the foregoing inquiries should be addressed to the Belgian Trade and Reconstruction Section of the Department of Overseas Trade, Canada House, Kingsway, London, W.C.2. (Reference No. 3742 T. and R.)

United States.

A firm of commission merchants, exporters and importers in New York, desire to become the purchasing or selling agents of United Kingdom manufacturers of, or dealers in, chemicals, drugs, dyes, and allied products. Firms should state the amount of subsidies and commission allowed, if cabling costs are paid by them, and whether they are prepared to make offers of parcels as opportunities arise. (Reference No. 262.)

Spain.

A merchant of Malaga desires to secure an agency in the Malaga district for a United Kingdom house manufacturing drugs and pharmaceutical products. (Reference No. 248.)

Switzerland.

An agent at Bâle wishes to represent United Kingdom firms dealing in chemicals, drugs, etc. (Reference No. 252.)

Peru.

The agent of a United Kingdom firm of exporters, is on a visit to England for the purpose of developing business generally and arranging for sole agencies in particular for chemicals. (Reference No. 268.)

ACID STILL FATALITY.—The Flintshire coroner conducted an inquest at Flint regarding the death of John Henry Martin, chemical labourer, who was killed last week owing to the collapse of an acid still at the works of the United Alkali Company. From the evidence it appeared that deceased and two other men were standing on the top of the still, and were engaged in losing the stones, when a wedge slipped, and the whole still then collapsed. Martin was practically killed outright, and Williams, who was assisting him, sustained severe injuries. A works engineer stated that he had examined the top stone and found a flaw in it, and in his opinion this caused the accident. Williams, who was in charge of the job of demolishing the still, was a very careful man, and always inspected a job beforehand. A verdict of "Accidental death" was returned.

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

Low Moor Munitions Company, Ltd.—Resolved June 26, confirmed July 21: That the company be wound up. J. Herschel, 39, Well Street, Bradford, liquidator. Meeting of creditors at liquidator's, August 6. Claims to liquidator by September 6.

Treburland Wolfram and Tin Company, Ltd., London, E.C.—Resolved July 16: That the company be wound up. T. D. C. Parker, 87, Bishopsgate, E.C., liquidator.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Bowley, S., and Son (Joseph Jno. Bowley, deceased, and Joseph Plunkett Bowley), Wellington Works, Wellington Road, Battersea Bridge, oil importers and refiners. August 21, 1918. (July 22.)

Lower Lansalson China Clay Company (Wm. Jas. Adams and Jno. Stephens, as trustees of Rchd. Frdk. Stephens, deceased; Wm. Jas. Kelly, Hart Nicholls, sen., Hart Nicholls, Jun., as trustee of Tom Nicholls, deceased; Hy. Pinch and Arthur Maunder Richards, as trustee of Rchd. Richards, deceased), St. Austell, china clay merchants. July 1. Debts will be received and paid by H. N. Wright, St. Austell, solicitor, liquidator of the firm. (July 25.)

Skilbeck Brothers (Geo. Thornton Skilbeck and Chas. Thornton Skilbeck), 205, Upper Thames Street, E.C., dry-salters. December 31, 1918. Debts by C. T. Skilbeck, who continues. (July 25.)

CORRESPONDENCE.

*** We do not hold ourselves responsible for the opinions expressed by our correspondents.*

Patents, Designs, and Trade Marks.

To the Editor of "The Chemical Trade Journal and Chemical Engineer."

Sir,—The Council of the Chartered Institute of Patent Agents desire to draw the attention of those interested in the protection of industrial property to articles 306-311 of the treaty of peace.

According to these articles, extensions of time are given for performing any act for the maintenance or obtaining of patents, designs, trade marks, or other industrial property in enemy countries, and also in Allied countries, which ought to have been accomplished during the period of the war—that is, since August 1, 1914. Moreover, rights of priority under the International Convention, which had not expired before August 1, 1914, may still be claimed.

It would be advisable for any person interested in any such matters to communicate at once with his patent agent, in order that he may be further advised in ample time to do what is necessary. Patent agents are now authorised to communicate with the former enemy countries, and to transact business relating to industrial property.—Yours, etc.,

H. THOMPSON, Secretary.

Staple Inn Buildings, London, W.C. 1, August 1, 1919.

BOOKS RECEIVED.

Welfare and Welfare Supervision in Factories and Workshops. Issued by the Home Office. London: H.M. Stationery Office. 1919. 2d. net.

Metrology in the Industries. Report of recent discussion before the Physical Society of London. London: Fleetway Press, Ltd. 1s. 2d., post free.

"An Apology for War Work." Messrs. Edgar Allen and Co., Ltd. A booklet containing in narrative form a very interesting record of their vast efforts during the war.

MARKET REPORTS.

FRENCH CHEMICAL MARKET.

PARIS, July 29.

Business has been quiet. Stocks are now somewhat reduced and if general conditions were more settled, trade might be resumed to a greater extent. However, under the prevailing circumstances, buyers are exceedingly cautious and business is entirely of the hand to mouth kind. The situation of English industry has, of course, been keenly watched and the crisis in the mining industry has been a foremost topic. The effect has been felt on the market by hardening prices of chemicals imported from England. As a whole, prices have been very firm. It would be idle to try to foresee the course of events, but the situation is sufficiently serious to require close examination. Caustic soda is much less abundant and, though manufacturers' prices for the 75/76 grade remain at 60 francs per 100 kilogs, delivered free buyer's station (equal to £17. per ton, c.i.f., Channel port), available lots have been sold at fully 10% more. Soda ash is also less freely to hand, whereas the production of bicarbonate of soda is sufficient at unchanged prices. Sodium sulphide is well asked for and is not produced in sufficient quantities, notwithstanding Customs duties amounting to £4. per ton; large quantities have been imported, mostly from Belgium, at a value of 75% of the cost of home manufactures. Hyposulphite of soda is manufactured in rather large quantities, leaving a certain margin for export; manufacturers' prices are 65 francs per 100 kilogs for the commercial quality and 70 francs for photographic purposes. Glauber salts are somewhat scarce, though manufacturers in the North of France are now able to produce again, but only in limited quantities. Sodium fluoride, which is mostly used by railway companies, is also manufactured in sufficient quantities for home use, imports from America being now practically nil. The same applies to sulphite of soda, whereas the demand has been rather good in bisulphite of soda powder, 60/62%. This chemical has been imported from England in fair quantities at an average price of £29. per ton c.i.f. French port. Liquid ammonia is still very scarce, but it is expected that French manufacturers will be able to meet the demand soon. Meanwhile import from England has been quite active. Salammuniac in lumps is in good demand at unchanged prices whereas the powder is still very dull. The requirements in carbonate of ammonia are increasing and imports from England and Holland have been rather important. Arsenic is dull and left aside. Borax is exceedingly scarce as previously and very high prices have been paid for available lots. Chloride of calcium is quiet. The demand for chloride of lime is important, home manufacturers being able to supply most of it. However, some quantities have again been imported from England, at reduced prices, ranging from £12. to £14. per ton c.i.f. French port. Phosphate of lime is a little more active, whereas carbonate of lime is quiet. Stocks of naphthalene are large, and the demand is nil; flakes especially find no buyers at all. Carbonate of magnesia is quiet, but business has been concluded in chloride of magnesium and commercial epsom salts. The price of mercury is below the London quotation and trade has been very quiet. The same applies to vermillion. Phosphate of ammonia is in very good demand, at higher prices, but phosphate of soda is entirely left aside, the Paris wholesale price being now 85 francs per 100 kilogs equal to £22. per ton c.i.f. French port. Salacetos is in moderate demand at unchanged prices. White sugar of lead is scarce, but the demand is small; most orders have been placed with American manufacturers at low prices. White lead is in very great demand; home manufacturers, like English and American producers, can deliver only with great difficulty. Import from Spain has been fairly important. Red lead and litharge are in fair request. Potassium salts are far from being abundant, but for previously explained reasons, buyers are very reluctant and hesitate to order at present high prices. The demand has been important in carbonate of potassium (98.99%), caustic potash, metabisulphite and permanganate of potash. Alsatian mines produce now important quantities of natural salts and chloride of potash, but are not in a position to deliver the above mentioned chemicals. Sulphur is in fair demand. Chloride of zinc is still dull, but sulphate is more active and scarce; also lithopone and zinc oxide. American lithopone has been again imported in large quantities. Zinc dust has been quiet, export to England having kept at the normal level. Amongst mineral acids, mention may be made of muriatic which is very scarce and offered at high prices. Sulphuric is still abundant. Acetic is rather scarce. In nitric

acid, production and demand are normal, at unchanged prices. Imports took place chiefly in phosphoric acid. Amongst organic acids, oxalic and lactic acids are scarce. Imports of tartaric and citric acids from Italy have been rather active. Customs duties have been again revised, but the change is little. The overtax will not be calculated *ad valorem*, but the existing duties are to be multiplied by a coefficient (ranging for chemicals between 1.4 to 3) which doubles and trebles the former duties.

TAR AND AMMONIA PRODUCTS.

WEDNESDAY.

Benzole: London, 90%, 2s.; North, 1s. 10d. to 1s. 11d.; 50%, 1s. 10d.; North, 1s. 9½d., naked. Carbolic acid, crude, 60%, East and West Coast, nominally 1s. 5d. to 1s. 6d.; crystals, 30-40%, 6d. to 6½d., f.o.b. Crude tar, London, 45s. to 60s.; Midlands, 44s. to 46s.; North, 45s. per ton, ex works. Pitch, 72s. 6d. to 75s.; East Coast, 65s., f.o.b.; West Coast, 53s. to 55s., f.a.s. Solvent naphtha, naked, London, 90-190%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 90-160%, naked, London, 2s. 1d.; North, 1s. 10d. to 1s. 11d. Crude naphtha, naked, 30%, 9d.; North, 8d. Refined naphthaline, £18. to £22.; salts, £6. to £7. Toluol, naked, London, 2s. 6d.; North, 2s. 5d. Creosote, naked, London, 6½d.; North, 5½d. to 6d.; heavy oil, 6½d. to 7d. Anthracene, 40-45%, 6d. per unit. Cresylic acid, 95%, 2s. 7d. to 2s. 8d.; 97-99%, 2s. 9d. to 2s. 10d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: Home trade, £19. 10s. per ton; basis 24½%. Nitrate of soda, £21. to £22.

FERTILISER MATERIALS.

LIVERPOOL, THURSDAY.

Nitrate of soda is again easier on spot, and the price of 95-96% quality is now £20. 2s. 6d. per ton, net cash, f.o.r., prompt delivery. East Indian Bone Meal: Shippers still maintain a firm attitude, and the nearest value of 41% ammonia and 52% phosphates, August-October shipment, is now £15. per ton, net cash, ex ship, Liverpool. On spot, Liverpool, holders require £15. per ton, net cash, for 41% and 45% quality. Mineral Phosphates: No alteration is to be reported in this market, and values are at present only nominal. Dried Blood: This article is scarce, the value being about 30s. per unit of ammonia per ton, net cash.

LONDON METAL MARKET.

THURSDAY.

Copper: Standard brands, £96. to £96. 5s., cash; £97. to £97. 5s., three months; electrolytic, £108. to £123. Tin: Standard, £276. to £276. 10s., cash; £263. to £263. 10s. three months; Straits, £280; English, £273. to £274. Lead: Soft foreign, £24. 15s.; English, £26. Spelter, £39. 10s.; hard, £31. to £32. Antimony, English regulus, 90%, £42. Aluminium, £150. Nickel, £205., delivered, packages extra. Quicksilver, £23. to £23. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 30s. per unit.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

Business generally during the past week has been fairly satisfactory, both for home and export, and values all round are steadily maintained. Resale lots of caustic soda, 70%, are still obtainable at £17. 10s., but 58% alkali is dearer at £6. 15s. to £7. per ton. Refined bicarbonate of soda, bags, unaltered at £8. per ton, f.o.b. Bleaching powder easy at £15., softwoods, on rails. Chlorates are dull at 7d. and 1s. 1d. for soda and potash respectively. Bichromates in good request at recent rates. Salteake firm at 60s. per ton, carriage paid. Recovered rock sulphur, £17. per ton, on rails. There is no change in copper sulphate, and export price continues nominal at £45. per ton, f.o.b. Commercial hyposulphite of soda is steady at £16. 10s., on rails, and pea crystals at £22. per ton. Phosphate of soda quiet at £25. 10s. per ton. Concentrated sodium sulphide, 60-65%, in casks, lower at £19. 10s. per ton. Nitrite of soda higher at £60. per ton. Supplies of white arsenic continue scarce, and price only nominal at £50. per ton. Yellow prussiate of potash firm at 1s. 9d. per lb. Soda is moving more freely at 7½d. per lb. Lead salts are in better demand, and quotations are steady: white acetate at £85. and brown £75. per ton. Nitrate, £57. per ton. Acetic acid and acetate of soda are quiet and unchanged. English brown acetate of lime is dearer at £11. per ton. American grey firm at £19. per ton. Miscible and solvent wood naphtha have a lower tendency. Oxalic acid, 1s. 2½d. to 1s. 3d. per lb. Permanganate of potash, English, is now quoted at 3s. 9d. per lb. for B.P. grade.

SWANSEA MARKET REPORT.

THURSDAY.

The prices of tinplates were firmer and standard size boxes were quoted at 33s. 3d. f.o.b. cas^t in 14 days. Copper prices were irregular and for immediate delivery small lots sold at £104. per ton. Tin £266. per ton cash, and slightly cheaper three months. Lead: Spanish £24.; English £25. per ton. Spelter £41. Antimony, English regulus, 90%, £40. Quick-silver £23. 5s. 0d. per bottle. Aluminium £150. Nickel in better request at £205., including delivery London or equal. Galvanised sheets (24g) £28. 10s. 0d. per ton f.o.b. Zinc sheets £65. f.o.b. New York. Pitch firm at 53s. per ton. Sulphate of ammonia £19. 10s. per ton, with steady sales for home demands. Nitrate of soda firm at 21s. 6d. per cwt. in bags. Arsenic in better request at £46. per ton for white powdered in bags f.o.b. Sulphate of copper remains quiet at £45. per ton for home purposes and £47. 10s. 0d. export in casks, f.o.b., less 5%. Turpentine 109s. per cwt. prompt cash. Bone meal dull at 14s. 3d. per cwt. Oxalic acid quiet at 1s. 2d. per lb.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

The chemical and produce markets have been disturbed since Tuesday by the strikes and riots with which the order loving element of the communities at Liverpool and the other Merseyside towns have had to contend. Since Saturday, a large force of soldiers, with "tanks" and full war equipment, may be said to have held the district. On Tuesday, business was resumed as far as could be, but the possibility of unfavourable developments of the labour crisis had a very repressing effect, and kept the markets quiet. Inquiries have come in to an extent that has shown that apart from these disturbances, trade is fairly good and chemical products are wanted largely. Bleaching powder has had a moderate inquiry, and is £14. 10s. to £15. per ton, free on rail or conveyance, in buyers' packages, and £17. per ton for export. Chloride of calcium has been quiet, and is £8. to £11. per ton in casks, f.o.r. Caustic soda has been in fair request, and is £24. per ton for 76%, £22. per ton for 70 to 72%, and £19. per ton for 60 to 62%. Nitrate of soda has been quiet and is £20. 10s. to £21. 10s. per ton. Saltcake has been but little called for and is £6. 10s. per ton in casks, f.o.b. Soda crystals have met with a rather good inquiry and are £5. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has been in fairly active demand and is £7. 5s. to £10. per ton, according to terms of delivery. Borax has been in very fair request and continues in light supply. Prices are £42. per ton for ordinary, and £44. per ton for powdered, in bags. Ammonia alkali has been in good request, and is £6. to £6. 5s. per ton, f.o.r. at works. Hyposulphite of soda has been quiet and is £19. to £20. per ton for ordinary, in crystals, and £25. per ton for pea crystals, in 1cwt. kegs. Sulphite has been inactive and is £11. per ton for ordinary and £18. to £19. per ton for pea crystals in 1cwt. kegs. Bichromate of soda has been but little in request and is 9d. per lb. Phosphate of soda has been very quiet and is £25. per ton. Sulphide of sodium has moved but slowly, and is £20. per ton in casks, and £22. per ton in drums. Chlorate of potash has had a moderate inquiry and is 1s. 1d. to 1s. 3d. per lb. Permanganate of potash has been in fair request and is 3s. 6d. per lb. Sulphate of potash has been neglected and is £40. per ton. Carbonate of potash has been quieter and is £85. to £90. per ton, for 80 to 85%. Caustic potash has had a more limited sale and is £90. to £100. per ton for 35° Bé. Nitrate of potash continues to meet with a very fair inquiry and is £50. to £58. per ton for refined and £40. per ton for ordinary. Canadian potashes have been inactive. Montreal first quality are £200. to £220. per ton and second quality, £190. to £210. per ton. Bichromate of potash has been quiet and is 1s. 6d. to 1s. 7d. per lb. Yellow prussiate of potash has been but little called for and is 1s. 9d. to 1s. 10d. per lb. Salammoniack has been in moderate request and is £80. per ton for lump, £75. per ton for seconds, and £5 extra per ton for ground. Sulphate of ammonia has been very quiet and is £19. 10s. per ton, less traders' discount of 10s. per ton, free to nearest wharf or railway station; to September 30. Carbonate of ammonia has been but little in request, and is 6½d. per lb. Muriate has been inactive and is £50. to £60. per ton according to quality. Magnesia has been in fair request. Carbonate is £3. 10s. per cwt., and sulphate £10. to £16. per ton, according to grade. Alum has met with a fairly active inquiry and is £18. 10s. per ton for the home trade, and £18. 10s. to £19. 10s. per ton for export. Aluminoferric has been but little in demand and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina

has been very quiet and is £12. to £17. per ton, according to grade. Sulphur has been in moderate demand, and supplies are still light. English kinds are: Flowers, £32. per ton; roll, £28. per ton; and rock, £22. per ton, in bags, f.o.r. Sicilian grades are: flowers, £28. per ton; roll, £22. 10s. per ton, and third quality, £17. 15s. per ton. Cream of tartar has been in very fair request, and is £11. 5s. to £11. 10s. per cwt. Tartaric acid has been rather more in demand and is 3s. 1d. per lb. Boracic acid has been quieter and is £72. per ton for crystals, and £74. per ton for powdered. Oxalic acid has been in limited demand, and is 1s. 3d. per lb. Magnesia carbonate is £3. 10s. per cwt. Citric acid has been in somewhat freer request, and is 4s. 4d. per lb. White acetate of lead has been very quiet and is £85. to £90. per ton. Arsenic has been but little called for and is £48. to £50. per ton for white powdered. Sulphate of copper has had a moderate sale on home trade account. For farm purposes in the United Kingdom it is £45. per ton, and for export, £47. to £48. per ton, less 5%, in casks, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.

TUESDAY.

Business in heavy chemicals continues fairly brisk, the demand for consumption for home trade being good; there is also more inquiry for export. Sulphur very scarce and firm. Soda crystals locally in steady request at £5. per ton 2cwt. bags. The following prices are per ton net: Bleaching powder, softs, and hards, £15. per ton net; caustic soda, 74/77%, £23. 5s., do. 70%, £22.; do., 60%, £20.; recovered sulphur, 2cwt. bags, £23.; hyposulphite of soda, 5/7cwt. casks, £19.; 1cwt. kegs, £25.; sulphite of soda, 5/7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75 Tw., £9. 12s. 6d.; do., 100 Tw., £10.; do., 140 Tw., £10. 10s.; soda crystals, 2cwt. bags, £5.; sulphate of soda (salt cake) in bulk, £3. 10s.; pure white sulphate of alumina, 14/15%, £19. 10s.; blanc fixe, £22.; chloride of barium, £27.; sulphide of sodium, crystals, £18.; do., refined concentrated solid, 60/62%, £25; hydrate of barium, crystals, £56.

COALS.—Market is quite unsettled and business extremely difficult—very little work has been done at the majority of the pits over the week-end. Quotations for neutral markets are about: Best Northumbrian steam, 85s. to 90s. per ton; best Northumbrian small coals, 45s.; best Durham gas coals, 70s.; seconds, 67s. 6d.; Durham bunker coals, 60s.; foundry coke, 70s. to 75s.; gas coke, 72s. 6d. to 77s. 6d.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

Glasgow only officially celebrated Peace on Monday of this week and this consequently led to a stoppage of business generally for the time being. By Tuesday morning, however, business was again more or less in full swing; but the general tone in the chemical and other markets during the week has been quietish. Only a moderate number of orders have been passing within the last few days and prices generally have been on a steady level. Current quotations are:—Arsenic £42. per ton net, Glasgow; bicarbonate of soda, £8. 15s. and £10. per ton for 6-8 casks and 1cwt. kegs, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags, and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £24. per ton, net, Glasgow; chlorate of potash, 1s. 1d. per lb., net, Glasgow; chlorate of soda 9d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 83%, £11. 5s. per cwt., net, Glasgow; salammoniack, £80. and £75. per ton, net, any port, for first and second lump respectively; salammoniack crystals £35. per ton, net, Glasgow; saltpetre, £3. 4s. net, Glasgow; tartaric acid, 3s. 1d. per lb., 5%, Glasgow.

In the sea oil section there are no special points of interest at the moment and the chief feature is the scarcity of supplies. Among the whale oils, for instance neither pale, yellow, nor brown varieties have this week been on offer: while what has been available of the black variety has maintained a steady tone at 78s.—which is about 2s. higher than the quotation about a month ago. Neither Newfoundland cod, pale seal, nor Menhaden have been on offer at all and generally the feeling pervading this section of the market is one of inactivity.

There was no change as far as the coal market in the Glasgow and West of Scotland is concerned and demand keeps somewhat quiet. Supplies of most kinds of coal are coming forward fairly well, but both from the domestic and industrial side there is a quiet feeling pervading the market.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

GLASGOW.

Week ending August 2.

BARYTES—
Valencia and Barcelona, 250 brls.
CREAM OF TARTAR—

Adelaide, 6 cs., £13.; Alexandria, 4 cs., £9.; Antwerp, 29 drms., £420.; Buenos Ayres, 15 drms., £280.; Canton, 3 cs., £12.; Rio de Janeiro, 14 cs., £37.; Rio Gallegos, 5 cs., £10.; Sevilla, 4 drms., £13.
- AMMONIA (ANHYDROUS)**—
Alexandria, 16 cylds., £164.; Buenos Ayres, 5 cylds., £92.
- AMMONIUM ACETATE**—
Bombay, 2 cs., £14.; Calcutta, 3 cs., £26.; East London, 1 cs., £10.; Singapore, 1 cs., £8.
- AMMONIUM CARBONATE**—
Alexandria, 2 t., £120.; Bombay, 3 c., £13.; Callao, 15 cs., £67.; Cape Town, 1 c., £5.; Cyprus, 5 c., £27.; Osaka, 10 t., £607.; Penang, 9 c., £39.; Porto Alegre, 1 c., £6.; Rio de Janeiro, 3 t. 14 c., £104.; Sao Paulo, 1 t. 15 c., £211.; Tokio, 10 t., £606.; Tuticorin, 2 c., £8.
- AMMONIUM CHLORIDE**—
Calcutta, 2 cs., £19.
- AMMONIUM MOLYBDATE**—
Paris, 3 cs., £191.
- AMMONIUM MURIATE**—
Abo, 1 t., £77.; Beyrout, 1 t., £73.; Brussels, 2 c., £6.; Bombay, 7 t. 10 c., £543.
- AMMONIUM SULPHATE**—
Dunkirk, 244 t., £6,250.; Yokohama, 200 t. 5 c., £4,800.
- AMYL ACETATE**—
Paris, 8 drms., £107.
- AMYLIC ALCOHOL**—
Brussels, 1 cs., £6.
- AMYL BUTYRATE**—
Sydney, 1 cs., £39.
- ANTIMONY SULPHIDE**—
Abo, 2 cks., £34.; Antwerp, 1 csk., £46.; Paris, 1 kgs., £23.
- ANTIMONY SULPHITE**—
Dunkirk, 2 cks., £76.
- ARSENIC**—
Rouen, 10 t. 6 c., £500.
- BENZOIC ACID**—
Melbourne, 1 cs. (pt.), £14.
- BISMUTH CARBONATE**—
Bombay, 1 cs. (pt.), £9.; Durban, 1 cs. (pt.), £11.
- BISMUTH SUBNITRATE**—
Amsterdam, 8 cs. (pt.), £76.
- BISMUTH SUBSALICYLATE**—
Amsterdam, 2 cs. (pt.), £76.
- BLEACHING POWDER**—
Boulogne, 10 t. 3 c., £200.
- BORAX**—
Abo, 2 t. 10 c., £120.; Antwerp, 4 t. 19 c., £210.; Karachi, 5 c., £13.; Paris, 50 t. (F.), £2,025.; Port Elizabeth, 3 c., £13.; Rio de Janeiro, 4 c., £11.; Rotterdam, 31 t. 19 c., £1,304.; Scheidam, 1 t., £40.
- BORIC ACID**—
Alexandria, 4 c., £20.; Buenos Ayres, 2 c., £11.; Calcutta, 12 c., £48.; Canton, 2 c., £11.; Hankow (F.), 10 t., £740.; Karachi, 1 c., £6.; Port Swettenham, 3 c., £14.; Shanghai, 25 t., £1,850.
- CABLE WAX**—
Genoa, 3 t.
- CALCIUM CARBONATE**—
Malta, 1 cks., £5.
- CALCIUM CHLORIDE**—
Cape Town, 1 cs. (pt.), £6.
- CAMPHOR**—
Buenos Ayres, £300.
- CARNAUBA WAX**—
Bordeaux, 10 c.; Genoa, 4 t. 10 c.
- CAUSTIC POTASH**—
Melbourne, 1 cs., £9.
- CAUSTIC SODA**—
Amsterdam, 16 drms., £108.
- CERESINE WAX**—
Amsterdam, 2 t. 4 c.; Antwerp, 4 t. 12 c.; Bordeaux, 3 t. 10 c.; Genoa, 3 t.
- CHEMICALS (otherwise undescribed)**
Canton, 1 cs., £15.; Durban, 13 pkgs., £405.; Durban (F.), 1 cs. (pt.), £10.; Hong Kong, 2 cs., £12.; Montreal, 7 cs. (pt.), £163.; Port Elizabeth, 2 cs., £57.; Port Swettenham, 1 cs., £27.; Salonika, 2 cs. (pt.), £53.; Shanghai, 2 cs. (pt.), £15.
- CHINA CLAY**—
Havre, 5 t.
- CHLORAL HYDRATE**—
Launceston (F.), 1 cs., £5.
- CHROMIC ACID**—
Brussels, 1 cs. (pt.), £6.
- CITRIC ACID**—
Barbados, 1 cs., £6.; Bombay, 1 c., £27.; Buenos Ayres, 1 cs. (pt.), £6.; Calcutta, 5 c., £126.; Cape Town, 5 c., £120.; Danzig, 10 c., £240.; Dunedin, 1 c., £24.; Hong Kong, 1 c., £26.; New York, 1 t. 5 c., £560.; New York (F.), 5 t., £2,150.
- COAL PRODUCTS (otherwise undes.)**
Brussels (F.), 1 cs. (pt.), £38.
- COAL PRODUCTS**—
Aniline Colour
Brisbane, 1 cs., £50.
Aniline Dye
Antwerp, 1 kg., £9.; Bordeaux, 2 cks., £67.; Boulogne, 7 cks., £775.; Durban, 1 cks., £6.; Italy, 7 cks., £770.; Hong Kong, 1 cs. (pt.), £15.; Singapore, 1 cs., £20.
Aniline Oil
Adelaide, 1 csi, £11.
Carbolic Acid
Buenos Ayres, 1 cs., £5.; Calcutta, 4 cs., £21.; Helsingfors, 52 cks., £436.; Karachi, 1 cs., £10.; Melbourne, 18 pkgs., £890.; Salonika, 6 drms., £34.
Creosote
Bangkok, 2 cs., £9.; Bilbao, 134 cks., £240.; Demerara, 10 cks., £40.; Shanghai, 2 cks., £12.
Mirbane Oil
Antwerp, 1 drms., £5.
Naphthalene
Bangkok, 1 cks., £6.; Canton, 1 cks., £5.; Demerara, 1 cks., £5.; Durban, 1 cks., £6.; Perth, 1 cks., £18.; Shanghai, 123 pkgs., £372.; Sao Paulo, 2 cs., £5.; Singapore, 3 cks., £14.
Paranitrotoluol
Bordeaux, 4 cks., £164.
Pitch
Antwerp, 327 t., £1,254.; Gibraltar, 13 cks., £7.
Tar
Bergen, 44 pkgs. (pt.), £10.
Terebine
Auckland, 2 cs., £10.; Brussels, 19 pkgs., £166.
Tolmol
Switzerland, 26 drms., £1,215.
Nylidine
Bordeaux, 1 drms., £111.
- COBALT OXIDE**—
Bombay, 2 cs., £106.
- COPPER AND ACETIC ARSENATE**
Santos, 4 cks., £234.
- COPPER SULPHATE**—
Antwerp, 4 t. 17 c., £210.; Amsterdam, 3 t. 6 c., £143.; Mombasa, 12 c., £26.; Syra, 3 t., £138.
- COPPERAS**—
Salonica, 16 cks., £20.

Alexandria, 1 t. 6 c., £175.; Bombay, 3 c., £18.; Buenos Ayres, 1 c., £9.; Calcutta, 9 c., £106.; Canton, 1 c., £8.; Durban, 2 c., £15.; Karachi, 3 c., £30.; Paris, 2 c., £31.; Port Swettenham, 1 c., £8.
- HYDROCHLORIC ACID**—
Adelaide, 2 c., £5.; Brussels, 2 t., £81.; Hong Kong, 1 c., £5.; Shanghai, 13 c., £38.
- HYDROGEN PEROXIDE**—
Alexandria, 16 cs., £33.; Brussels, 3 cks., £37.
- IODINE**—
Buenos Ayres, 1 cs., £110.; Rotterdam, 2 cs., £180.
- IRON AND AMMONIUM CITRATE**
Brussels, 2 cs. (pt.), £12.; Montreal, 7 cs. (pt.), £17.; Perth, 1 cs. (pt.), £13.; Shanghai, 1 cs. (pt.), £8.
- IRON & POTASSIUM CYANIDE**—
Brussels, 1 cs. (pt.), £11.
- IRON CITRATE**—
Amsterdam, 1 cs., £25.
- IRON CYANIDE**—
Brussels, 1 cs. (pt.), £6.
- IRON OXALATE**—
Brussels, 1 cs. (pt.), £8.
- IRON PERCHLORIDE**—
Calcutta, 2 cs., £7.; Port Elizabeth, 1 cs., £7.
- IRON SULPHIDE**—
Adelaide, 3 cs., £11.
- LACTIC ACID**—
Dunkirk, 5 brls., £78.; Melbourn, 6 cks., £67.; Sydney, 15 cks., £150.; Valparaiso, 20 cks., £212.
- LEAD ACETATE**—
Boulogne, 1 brl., £26.; Salonika, 1 kg., £11.; Sao Paulo, 5 cks., £50.
- LEAD SUBACETATE**—
Calcutta, 2 cs., £12.
- LEAD SULPHITE**—
Dunkirk, 2 cks., £77.
- MAGNESIA (CALCINED)**—
Monte Video, 3 cs., £90.
- MAGNESIUM CARBONATE**—
Buenos Ayres, 21 cs., £180.; Mollendo, 2 cs., £5.; Rouen, 14 cks., £51.
- MAGNESIUM CITRATE**—
Brussels, 1 cs., £15.
- MAGNESIUM OXIDE**—
Abo, 3 cs., £38.
- MAGNESIUM SULPHATE**—
Bombay, 19 c., £59.; Brussels, 10 c., £11.; Buenos Ayres, 5 c., £6.; Cape Town, 3 c., £5.; Hong Kong, 3 c., £5.; Karachi, 12 c., £31.; Montreal, 1 t., £33.; Mossel Bay, 6 c., £14.; New York, 1 t., £38.; Port Elizabeth, 12 c., £28.; Porto Alegre, 9 c., £24.; Toronto, 5 c., £5.
- MERCURY BICHLORIDE**—
Brisbane, 1 cs. (pt.), £7.; Paris, 2 cs., £163.
- MERCURY CHLORIDE**—
Paris, 4 cs., £330.

MERCURY IODIDE—
Brussels, 1 cs. (pt.), £7.

MERCURY OXIDE—
Brussels, 1 cs. (pt.), £21.; Dunkirk, 1 cs., £75.; Paris, 12 cs., £312.

MERCURY PERCHLORIDE—
Cape Town, 4 cs. (pt.), £9.; Karachi, 1 cs. (pt.), £9.

MOLYBDIC ACID—
Paris, 2 cs., £191.

MURIATIC ACID—
Port Madryn, 1 c., £5.

NICKEL OXIDE—
Dieppe, 5 cs., £110.

NICKEL SALTS—
Yokohama, 50 cs., £125.

NITRE SPIRITS—
Toronto, 1 cs., £5.

NITRIC ACID—
Adelaide, 2 c., £6.; Port Elizabeth, 9 c., £18.

OXALIC ACID—
Buenos Ayres, 1 kg., £7.; Calcutta, 1 cs. (pt.), £6.; Hong Kong, 1 cs., £55.; Sao Paulo, 10 kgs., £35.

PARAFFIN WAX—
Genoa, 70 t. 19 c.

PARALDEHYDE—
Barcelona (F.), 1 cs., £29.

PHOSPHORIC ACID—
Montreal, 10 crbys., £91.; Paris, 60 crbys., £453.

PHOSPHORUS—
Canton, 1 cs., £10.; Launceston, 2 cs., £26.

PHOSPHORUS SESQUISULPHIDE—
Barcelona, 10 cs., £165.; Santander, 30 cs., £474.; Seville, 20 cs., £329.

PLUMBAGO—
Rosario, 2 t.; Shanghai, 4 t.

POTASSIUM BICARBONATE—
Cape Town, 1 cks., £36.

POTASSIUM BICHROMATE—
Rotterdam, 12 cks., £735.

POTASSIUM BISULPHITE—
Montreal, 40 kgs., £575.

POTASSIUM BROMIDE—
Alexandria, 1 cs. (pt.), £5.; Canton, 6 cs. (pt.), £5.; Cape Town (F.), 4 cs. (pt.), £5.; Launceston, 1 cs., £15.; Piraeus (F.), 1 cs. (pt.), £9.

POTASSIUM CARBONATE—
Athens, 1 cks., £20.; Brussels, 1 cks., £13.; Lisbon (F.), 2 cs., £8.; Rio de Janeiro, 1 cks., £14.

POTASSIUM CHLORATE—
Brussels, 11 c., £110.

POTASSIUM CHLORIDE—
Bangkok, 1 c., £20.; Melbourne, 1 c., £5.

POTASSIUM CITRATE—
Alexandria, 2 cs., £33.; Amoy, 10 cs. (pt.), £5.; Canton, 9 cs. (pt.), £18.; Montreal, 7 cs. (pt.), £72.

POTASSIUM CYANIDE—
Amoy, 1 drn. (pt.), £6.; Bombay, 8 c., £151.; Singapore, 4 cs., £55.

POTASSIUM HYPO—
Osaka, 10 cs., £365.

POTASSIUM IODIDE—
Amoy, 10 cs. (pt.), £13.; Amsterdam, 1 cs., £80.; Bangkok, 2 cs., £100.; Cape Town, 4 cs. (pt.), £10.; Genoa, 2 cs., £76.; Hong Kong, 1 cs. (pt.), £9.; Macas, 4 cs. (pt.), £7.; Naples, 2 cs., £78.; Rotterdam, 4 cs. (pt.), £161.; Swatow, 12 cs. (pt.), £12.

POTASSIUM METABISULPHATE—
Melbourne, 2 cs. (pt.), £3.

POTASSIUM OXALATE—
Cape Town, 1 cs. (pt.), £6.

POTASSIUM PERMANGANATE—
Brussels, 2 cs., £45.; Penang, 5 cs. (pt.), £16.

POTASSIUM SULPHATE—
Brussels, 1 c., £16.

POTASSIUM SULPHIDE—
Ab 4 cks., £33.

PRUSSIAN BLUE—
Antwerp, 6 cks., £154.; Paris, 6 cks., £154.

PYROGALLIC ACID—
Amsterdam, 1 cks. (pt.), £9.; Brussels (F.), 1 cs., £8.; Hong Kong, 1 cs., £11.

QUININE—
Cape Town, 1,162 ozs.

SALICYLIC ACID—
Antwerp, 20 cks., £160.; Barcelona, 4 kgs., £34.; Brussels, 2 cs., £12.; Singapore, 1 kg., £7.

SALT—
Cuba, 5 c.; Rosario, 1 t.; Singapore, 1 t.; Tientsin, 1 t.

SALTPETRE—
Alicante, 10 c., £25.; Amsterdam, 1 t., £62.; Barcelona, 4 t. 5 c., £213.; Bilbao, 1 t., £50.; Calcutta, 2 c., £9.; Montreal, 1 t., £50.; Port Swettenham, 1 c., £5.; Santander, 2 t. 18 c., £149.; Santos, 4 t. 18 c., £293.; Valencia, 1 t. 5 c., £63.

SHEEP DIP—
Buenos Ayres, 1 t. 2 c., £81.; Durban, 11 t. 5 c., £451.; Montevideo, 25 t. 7 c., £400.

SILVER NUCLEINATE—
Brussels, 1 cs. (pt.), £5.

SIZE—
Rangoon, 3 c.

SOAP—
Abo, 2 c.; Alexandria, 1 t. 15 c.; Aden, 5 c.; Amsterdam, 1 t. 18 c.; Adelaide, 3 c.; Antwerp, 313 t. 13 c.; Bangkok, 1 t.; Barbados, 1 c.; Batavia, 4 c.; Beira, 5 c.; Bombay, 2 t. 2 c.; Brisbane, 1 c.; Bordeaux, 1 t. 4 c.; Canton, 3 c.; Calcutta, 4 c.; Cape Town, 2 c.; Canary Islands, 6 c.; Cologne, 82 t. 14 c.; Constantinople, 19 c.; Colombo, 1 t. 14 c.; Cyprus, 4 c.; Danzig, 40 t.; Demerara, 9 c.; Dieppe, 19 c.; Dunkirk, 5 t. 14 c.; Durban, 12 c.; Genoa, 3 c.; Ghent, 7 c.; Hong Kong, 11 c.; Italy, 3 c.; Jaffa, 1 c.; Jamaica, 1 c.; Karachi, 17 c.; Kilindini, 1 c.; Launceston, 1 c.; Lisbon, 7 c.; Lyttleton, 3 t. 10 c.; Madras, 6 c.; Melbourne, 6 c.; Malta, 15 c.; Mossel Bay, 1 c.; Montreal, 15 c.; New York, 1 t. 17 c.; Ostend, 1 t. 3 c.; Paramaribo, 1 c.; Paris, 65 t. 12 c.; Perth, 1 t. 2 c.; Penang, 4 t. 3 c.; Porto Alegre, 4 c.; Port Elizabeth, 5 c.; Port Swettenham, 7 c.; Rangoon, 12 c.; Samarang, 3 c.; Shanghai, 13 c.; Singapore, 3 c.; Smyrna, 15 c.; Sydney, 5 c.

SODA—
Bangkok, 3 c., £5.

SODA ASH—
Genoa, 30 t., £300.

SODIUM BENZOATE—
Beyrout, 1 cs. (pt.), £7.; Constantinople, 1 cks., £50.; Port Madryn (F.), 1 cs. (pt.), £16.

SODIUM BICARBONATE—
Bangkok, 2 c., £8.; Bombay, 15 c., £17.; Bordeaux, 1 t., £14.; Brussels, 4 c., £7.; Calcutta, 4 c., £8.; Danzig, 9 t. 8 c., £94.; Hong Kong, 1 t. 3 c., £25.; Mollendo, 1 t., £33.; Montreal, 19 c., £41.; Port Elizabeth, 10 c., £19.; Smyrna, 2 c., £6.; Toronto, 1 t. 3 c., £50.

SODIUM BICHROMATE—
Port Elizabeth, 3 t. 3 c., £275.

SODIUM BISULPHITE—
Antwerp, 6 t. 2 c., £180.; Barcelona, 2 t., £65.

SODIUM CITRATE—
Alexandria, 2 cs., £14.

SODIUM GLYCEROPHOSPHATE—
Port Swettenham, 1 cs. (pt.), £7.

SODIUM HYDRATE—
Brussels, 1 cs., £35.

SODIUM HYDROSULPHATE—
Sydney, 1 t., £350.

SODIUM HYPO—
Brussels, 1 t. 19 c., £70.; Durban (F.), 5 c., £7.; Hong Kong, 9 c., £13.

SODIUM HYPOSULPHITE—
Antwerp, 1 t. 2 c., £27.

SODIUM IODIDE—
Amsterdam, 1 cs., £42.; Genoa, 2 cs., £83.; Naples, 2 cs., £83.

SODIUM PHOSPHATE—
Alexandria, 2 cs., £7.; Constantinople, 8 c., £13.

SODIUM SALICYLATE—
Cape Town, 2 cs., £15.; Montreal, 1 cs. (pt.), £7.

SODIUM SILICATE—
Constantinople, 6 c., £10.

SODIUM SULPH—
Alexandria, 1 cs., £9.; Port Swettenham, 1 cs., £16.

SODIUM SULPHATE—
Calcutta, 5 c., £5.

SODIUM SULPHITE—
Antwerp, 1 t. 1 c., £17.; Bombay, 1 cs., £13.; Dunkirk, 1 t., £17.; Sydney, 1 t., £33.

SODIUM TARTRATE—
New York, 5 t., £700.

STEARINE—
Antwerp, 12 c.

SULPHUR—
Wormerveer, 5 t., £110.

SULPHUR (FLOWERS)—
Antwerp, 6 t. 6 c., £173.; Bordeaux (F.), 20 t., £460.

SULPHURIC ACID—
Adelaide, 2 c., £6.; Oamaru, 3 c., £13.; Paranagua, 3 t. 6 c., £250.; St. Vincent, 3 t. 11 c., £105.

SUPERPHOSPHATE—
Canary Islands, 20 t.

TALLOW—
Havre, 24 t.; Port Swettenham, 8 c.

TANNIC ACID—
Brussels (F.), 4 cks., £94.

TARTARIC ACID—
Bombay (F.), 3 c., £60.; Bombay, 1 c., £21.; Buenos Ayres, 1 c., £23.; Callao (F.), 1 c., £22.; Dundee, 2 c., £35.; Durban, 1 c., £20.; Mollendo (F.), 3 c., £63.; Port Antonio, 2 c., £35.; Port Elizabeth, 1 cs., £6.; Sydney, 10 c., £151.; Toronto, 2 t. 2 c., £749.

THEOBROMINE SODIUM SALICYLATE—
Marseilles, 2 cs., £120.

WAX—
Kobe, 4 c.

WHITE LEAD—
Aden, £75.; Antwerp, £2,036.; Barbados, £54.; Bermuda, £47.; Bombay, £71.; Havre, £241.; Hobart, £19.; Hong Kong, £181.; Karachi, £185.; Ostend, £60.; Rabat, £182.; Sandakan, £22.; Tangiers, £32.

ZINC SULPHATE—
Karachi, 1 c., £7.

MANCHESTER.

Week ending July 30.

AMMONIUM CARBONATE—
Gothenburg, 85 pkgs.

BITUMASTIC SOLUTION—
Philadelphia, 100 cks.

CAUSTIC SODA—
Melbourne, 5 crts.

COAL PRODUCTS (otherwise undes.)—
Gothenburg, 49 drms.

DYESTUFFS—
Tanning Extract
Melbourne, 38 cks.

LITHARGE—
Sydney, 2 cks.

MAGNESITE (CALCINED)—
Marseilles, 140 bgs.

MANGANESE BORATE—
Gothenburg, 2 cks.

MANGANESE SULPHATE—
Philadelphia, 20 cks.

SALAMMONIAC—
Marseilles, 10 cks.; Montreal, 5 cks.

SALT—
Gothenburg, 5,420 pkgs.; Montreal, 11,152 sks.

SODA ASH—
Gothenburg, 434 bgs.

SODIUM BICARBONATE—
Gothenburg, 100 pkgs.

SODIUM PRUSSATE—
Montreal, 5 cks.

SULPHATE CRYSTALS—
Rotterdam, 10 cks.

SULPHIDE—
Rotterdam, 3 cks.

ULTRAMARINE BLUE—
Sydney, 4 cks.

ZINC CHLORIDE—
Rotterdam, 74 cks.

MIDDLESBROUGH.

Week ending August 2.

AMMONIUM SULPHATE—
Kobe, 2,011 t. 4 c., £39,700.; Singapore, 50 t., £350.; Yokohama, 224 t. 5 c., £3,755.

COAL PRODUCTS—
Benzole
Antwerp, 19 c., £20.

CHEMICALS (otherwise undescribed)—
Calcutta, 64 t. 4 c., £933.; Madras, 12 t. 5 c., £178.; Singapore, 18 t., £289.

COAL PRODUCTS—
Naphthalene
Antwerp, 1 t., £17.

Pitch
Antwerp, 1,617 t., 1 c., £4,310.

NEWCASTLE-ON-TYNE

Week ending August 2.

AMMONIUM CARBONATE—
Bergen, 2 t.

ANTIMONY—
Rotterdam, 3 t. 10 c.

BLEACHING POWDER—
Rotterdam, 54 t.

CAUSTIC SODA—
Rotterdam, 64 t. 2 c.

GELATINE—
Christiania, 1 c.

GLUE—
Christiania, 1 t.

LITHARGE—
Rotterdam, 9 t. 18 c.

MAGNESIA—
Rotterdam, 1 c.

RED LEAD—
Rotterdam, 15 t.

SODIUM SULPHITE—
Rotterdam, 5 t. 2 c.

SULPHUR—
Rotterdam, 10 t.

TAR—
Rotterdam, 15 t.

WHITE LEAD—
Rotterdam, 14 t. 17 c.

ZINC (WHITE)—
Rotterdam, 5 c.

N. & S. SHIELDS.

Week ending August 2.

WHITE LEAD—
Christiania, 2 t. 2 c.

STOCKTON-ON-TEES.

Week ending August 2.

NIL.

SWANSEA.

Week ending August 2.

OXALIC ACID—
Marseilles, 19 t., £136.

PRICES CURRENT.

THURSDAY, August 7, 1919.

PREPARED BY MESSRS. HIGGINBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified.
The prices in different localities may vary.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ...	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3080, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

Trade Advertisements, Announcements, in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

Advertisers would oblige by writing advertisements and letters of instructions on separate sheets of paper.

EDITORIAL NOTICES.

INDEX.

Copies of the Index to Volume LXIV. (January-June, 1919), of the "Chemical Trade Journal and Chemical Engineer," which is now available, will be forwarded to those readers who make early application to the Publishers.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

CURRENT TOPICS.

PATENTS AND DESIGNS.

THE conference on patents recently held in London and the fact that both the Patents and Designs Bill and the Trade Marks Bill have passed quickly through the Standing Committee stage of the House of Commons, enable a more or less definite review of the position to be given. One fact not unworthy of attention is that only 35 members out of a House of 700 took the trouble to attend on the occasion of the second reading debate and we are tempted to contrast that with the crowded Terrace on the occasion of the Pageant on the River Thames a few days later. This apathy on the part of our legislators is a little disconcerting at a moment when genuine hopes were being developed that the value of science and invention to the nation at large was receiving a greater measure of appreciation at the hands of Parliament and through it by the public. However, thanks to endeavours on the part of the scientific and technical societies in the first place, reinforced later by the Federation of British Industries, the ideas and demands of the industrial section of the community have been insistently impressed upon the Government, and we can have little hesitation in accepting the view of Sir George Croydon Marks, supported by Lord Moulton, that the 1919 Patents Bill constitutes a new charter for inventors, notwithstanding that it possesses certain points which, in the view of some people, are still unsatisfactory. The Standing Committee stage of both Bills was got through at one sitting of the committee in each case, and on the whole, it may be remarked that the almost obstinate policy which the Government appear to have developed of insisting in carrying measures more or less in the form in which they are originally introduced was again successfully adopted. In other words, the amendments accepted were but few. As we pointed out last week, two main points arose out of the Patents Bill; one, the question of meting out justice to patentees whose patents could not be worked

owing to the war, and, two, a reduction of renewal fees. The Bill dealt with neither of these matters as it was introduced and the Government resisted amendments to give effect to what was discussed at the conference. So far as the first point is concerned, therefore, the position is that the life of all patents in existence at the time of the passing of the Act will be automatically increased by two years, this two years to be added to the initial period of four years at present covered by a fee of £5, and if any patentee wishes to claim that he was damaged by the compulsory non-working of his patent during the war, he must apply under Clause 7 of the Bill for an extension on these grounds, the Court having power to grant an extension for a period of five years or, in exceptional cases, ten years. That of course meets the case up to a point, but it puts the patentee to a great deal of trouble and expense. Moreover, it rules out altogether the patentee whose patent has expired during the war and could not be worked during that portion of the war when it was not in force. An amendment by Sir G. Croydon Marks making the life of all patents 18 years instead of 14 years, apparently with the idea of covering the case of the non-worked patent during the war, although it would at the same time extend all patents, was resisted by the Government, and was withdrawn. Another amendment, giving effect to the views expressed at the conference, to reduce the renewal fees of £95 by half was also opposed by the Government and was also withdrawn. Clause 1, which deals with the prevention of abuse of monopoly rights received considerable criticism in committee, and the Government amended paragraph (c) of sub-section (2) by making it clear that unfair conditions would be regarded as an abuse of monopoly rights. Two other small amendments may be noted. One is that an independent tribunal is to decide the amount to be paid an inventor whose invention is used by the Crown, whilst the right of the Crown under Clause 15 in regard to the registration of a design is to be subject to an appeal.

The chief feature of the Trade Marks Bill is the introduction of a double register, Class A registrations being those at present in existence and accepted in future under the same conditions, whilst Class B will consist of registrations of trade names which at present are not registrable but in which, from long usage, the owners of particular goods have a proprietary interest. The chief fear of those who have entrusted this part of the Bill has been that registration in Class B will denote an inferior category, but that is not the intention. The two classes are intended to be of equal value, Class B making registrable, and therefore giving a status to, certain trade names which cannot be accepted under the existing trade marks law. As a matter of fact, we understand that the new classification is intended to benefit mainly the chemical industry and to protect it against the proprietary use of trade names by German chemical manufacturers in respect of substances which can commonly be made. The point is that many trade names in this country, which are recognised as referring to specified goods, cannot be registered abroad because hitherto they have not been acceptable in this country for registration; and registration under Class B should facilitate their adoption, and strengthen the position of the manufacturers abroad.

As we have already said, both Bills may be capable of further amendment, but it would obviously be impossible to express everybody's views because they would, in some respects, necessarily conflict. We believe the Government have made a genuine effort to hold the balance

evenly in a sincere endeavour to assist British trade by encouraging invention. Inventors naturally are but human and they may be inclined to take a rather too narrow view of matters concerning their own interests. Unfortunately past experience has given them good cause to investigate searchingly Government proposals in this respect and they are to be forgiven if they tend to go to the other extreme in what they demand. The position now, however, compared with what it was in 1907, has very much improved from the inventor's point of view, if only that we now have an Institute of Inventors which is backed up by some 25 of the leading engineering and scientific societies in the country and a Federation representing several thousands of millions of capital invested in industry. The 1919 Patents Bill is admittedly superior to the measure which was introduced in 1917 and quickly withdrawn, and except in respect of the two main points we have mentioned it has not met with considerable detailed criticisms. Anyway a good start has been made, and in regard to fees, that is not necessarily a point to be inserted in the Bill, because it can be dealt with under the powers of the 1907 Act. It is evident there is not time for the preparation this Session of that comprehensive measure by a committee representative of trade interests suggested at the conference by Mr. J. Hunter Gray, and what is now before Parliament will have to be accepted as something on account.

TRADE RETURNS.

The Board of Trade returns for last month, notwithstanding the improvement in the value of the total exports compared with a year ago, are the reverse of comforting in view of the very formidable increase in imports. Exports, valued at £65,315,000, were £21,671,000 higher than in July, 1918, but only about £750,000 more than in June of this year. The imports, on the other hand, were valued at £153,140,000 or an increase of £44,000,000 compared with the corresponding month of last year, and of £30,000,000 over the value of the June imports. Thus, the adverse trade balance, far from undergoing a drastic reduction, is considerably greater than at any time during the past five years. Chemicals, drugs, dyes and colours, on the export side, were valued at £1,985,000, an increase of nearly £162,000 over the value in the corresponding month of last year. The increase, of course, is satisfactory, but the total value is far behind what it was in the earlier months of the year. The shipments of bleaching powder, sulphate of copper, sulphate of ammonia and other chemical manures, muriate of ammonia, painters' colours and materials, nitrate, chromate and bichromate of potash, soda ash, sodium bicarbonate, sulphuric acid, and tartaric acid were on a larger scale. Declines in the exports of chemical products were few, and with the exception of "Chemicals, other sorts," which dropped from £600,000 to £372,000, were confined to certain coal-tar products, glycerine, and some of the soda compounds. Imports of chemicals and allied products were valued at £2,157,313, against £3,895,778 in July, 1918, a decrease of £1,738,465. The receipts of acetic acid, boracite, borate of lime, etc., calcium carbide, barytes, white lead, zinc oxide, and painters' colours and pigments were much heavier than they were a twelve-month ago, but decreases were shown in the imports of certain products, notably sulphur (from 171,200 cwt. to 1,013 cwt) coal products (not dyes), cream of tartar, glycerine, saltpetre, soda compounds, tartaric acid, and "chemicals, enumerated" (from £2,243,763 to £338,206.)

ALKALI INSPECTOR'S REPORT FOR 1918.

(Concluded from page 141.)

Chemical Manure Works.

THE number of registered works of this class was 142, an increase of four over 1917. This increase is notable as breaking the continuous gradual decrease in number of these works during the preceding eight years. There were also considerable alterations and improvements effected which gave increased power of production. The means provided for preventing escape of noxious gases were maintained in satisfactory condition.

Much greater activity characterised this industry, and still greater production might have been achieved had available labour been more abundant. There was not the lack of sulphuric acid evident in the previous year, but the use of nitre-cake referred to in the report for 1917 as a method of producing superphosphate in the absence of sulphuric acid was continued, and is likely to become a permanent process, as it has certain advantages apart from the question of producing supers during a period of limited acid supply.

The use of mechanical dens extended considerably, to the advantage of the industry and the improvement of conditions in the works. The number and variety of designs of the dens are now considerable; in addition to those which have been in operation for a number of years, many new examples continue to be introduced. Mr. Littlefield, in his report on District IVA., comments favourably on the Sturtevant plant; and Dr. Fryer, in his report on District VIA., describes the new "Hill and Eden" design, which differs from others in its general features. He states that there is a mixer in continuous operation discharging into a series of dens, and proceeds: "The dens are four in number, being rectangular in form, 9ft. high by 5ft. square below and 4ft. 6in. above, each holding three tons of superphosphate. When one is filled, the false bottom is wheeled away on a trolley and replaced by a screen of pianoforte wires, and pressure is then applied to the top of the den, and the mass of superphosphate passes through the wire screen into a hopper below."

Sulphate and Muriate of Ammonia and Gas Liquor Works.

There was an increase of one in the total number of registered works in these two important groups. The total of 743 was composed of 632 sulphate of ammonia and 111 gas liquor works, as compared with 634 sulphate of ammonia and 108 gas liquor in 1917. Towards the end of the year there was a reversion towards the manufacture of sulphate of ammonia in several works where plant for production of concentrated ammoniacal liquor had been erected to meet the extensive but temporary demand for that product required for munition purposes.

Through the courtesy of manufacturers, I am again able to present figures showing the quantity of ammonia products manufactured in the United Kingdom as a by-product in the various industries named in the following statement.

The production and character of ammonia products continued to be influenced by war conditions. The total quantity produced was less than in 1917 by the equivalent of 26,066 tons of sulphate of ammonia; thus the first and the last year of the war were both associated with a reduction in recovery

of ammonia products, although in 1914 the reduction was only 6,206 tons. The shrinkage in 1918 was large when the expanding character of ammonia recovery for many years past is considered.

AMOUNT OF AMMONIA PRODUCTS MANUFACTURED IN THE UNITED KINGDOM (expressed in Terms of Sulphate 24½ per cent. NH₃)—Tons.

From Liquor produced in	1918.	1917.	1916.
Gas works	173,541	188,478	172,269
Iron works	12,717	13,621	15,151
Shale works	58,311	60,560	57,988
Coke oven works	161,418	166,354	159,506
Producer-gas and carbonising works (bone and coal)	23,534	29,604	28,786
Total	432,551	458,617	433,703

NOTE. Of the above total quantity of ammonia products the equivalent of 121,681 tons was manufactured as concentrated ammoniacal liquor; the balance of 310,870 tons consisted of other ammonia products (sulphate, chloride, nitrate, etc.).

Many influences tended towards a reduced production. Amongst those affecting gasworks may be mentioned the inferior quality of coal used in many works, the use of water gas, the large production of gas per ton of coal carbonised, the use of steam in vertical retorts, the production of concentrated ammoniacal liquor accompanied too frequently by a high working loss of ammonia, and a reduction in the quantity of gas consumed.

It may be well to point out, as a similar passage in last year's report was not fully apprehended by everyone, that a large production of gas per ton of coal carbonised and the use of steam in vertical retorts may lead to an increased recovery of ammonia per ton of coal; but if the weight of coal used per volume of gas distributed is more than correspondingly less, an increased recovery per ton of coal is associated, on a similar gas consumption, with a decrease in the actual quantity recovered.

There was, further, a reduction in the ammonia products recovered in shale works and in producer-gas and carbonising works, as well as a moderate reduction in ironworks.

From a recent report on mines and quarries for the year 1918 the following statistics have been extracted: There were 16,540 coke-ovens in use, comprising—7,013 of the beehive type, 2,217 of the Otto Hilgenstock design, 1,750 of the Simon Carvès design, 1,415 of the Coppee design, 1,361 of the Koppers design, 1,357 of the Semet Solvay design, and 1,427 unnamed.

It is noteworthy that all these designs of named origin are of foreign creation, as also are some at all events of the residue of 1,427 not specially particularised. The number of ovens of the beehive type is still large, but in some cases local conditions—such, for instance, as the total quantity of local coal—may not justify the expenditure necessary for the erection of the more elaborate recovery plants. Prior to the war the erection of recovery coke-oven plants seemed to have got under foreign, largely German, control. During the war important additions have been made to works of this class by British effort and British material, so that the future erection of such need not return under the former control.

The sulphuretted hydrogen evolved in course of dealing with crude ammoniacal liquor was disposed of satisfactorily by the methods previously in use. The oxide of iron purifier came into more extended use. In one works a Claus sulphur recovery plant, and in another works a combustion with subsequent neutralisation plant, were discarded and replaced by oxide purifiers of the heap type. In one works the general condition of the plant was allowed to deteriorate, but new condensers were being erected and other needful improvements were being effected at the end of the year.

A fatal case of gassing occurred in a gas-liquor works. Owing to omission to follow the proper procedure when taking steps to remove a blockage in the exit pipe from the decomposer in a plant for producing concentrated ammoniacal liquor in a coke-oven works, the attendant was overcome by the waste gases, which escaped in his vicinity instead of being directed into the channel provided for them.

A second fatality occurred in a sulphate of ammonia works from the action of the noxious gases evolved from gas liquor. A young woman who was operating the sulphate of ammonia

plant had apparently removed a plug from a vent hole in the pipe leading from the ammonia still to the saturator, and then left the plant for a short time. On her return it is probable that she endeavored to replace the plug, but was fatally affected by the discharge through the vent hole, which would consist mainly of steam, ammonia, carbonic acid, and sulphuretted hydrogen, with possibly also some hydrocyanic acid. Death was stated to be due to carbonic-acid poisoning, but other constituents of the discharge would also act prejudicially. A fatality arising in this way is most uncommon, and was not to be anticipated. Means have been provided to prevent by special ventilation a recurrence of so regrettable an experience.

New installations of the direct process in gasworks were put into operation, but in two gasworks this process was discontinued as unsatisfactory, and replaced by plant of the ordinary distillation type. In other gasworks the recovery of ammonia by the direct process was disappointingly low. It is only by careful attention to working conditions at the "bubbler," the ammonia still, and the gas purifiers that the best results can be obtained. At those works where this process has been specially studied further improvements in production were effected. In another works the yield of sulphate of ammonia per ton of coal carbonised was raised from 13lb. to 17lb.

SULPHATE MANUFACTURE WITHOUT SULPHURIC ACID.

Mr. Littlefield forwards the following remarks regarding a process for the manufacture of sulphate of ammonia without consumption of sulphuric acid, which has for some time past been under trial in District IVa:—

"Professor Cobb's process aims at utilising the sulphur contained in coal for fixing ammonia in gas as ammonium sulphate without the use of sulphuric acid supplied from outside. For this purpose the gas is passed through a centrifugal washer, and there treated with a solution of zinc sulphate. Zinc sulphide is precipitated, and ammonium sulphate is formed in solution. On filtration, the ammonium sulphate is recovered by evaporation. The precipitated zinc sulphide is roasted, and the roaster gases with excess of air are blown through water which contains in suspension zinc oxide from a previous roasting. Zinc sulphate is so regenerated and the cycle completed. Tarry matter does not interfere, because it is destroyed in the roaster. The process has been proved successful on the laboratory and small-scale works. The erection of a plant to make a ton of ammonium sulphate per day has been delayed by war conditions, but is now completed, and the process is undergoing trial on the full works scale indicated."

EFFICIENCY IN AMMONIA RECOVERY.

There were widely varying experiences in the manufacture of concentrated ammoniacal liquor as regards the working loss of ammonia. In some works this amounted to a serious figure, in others it was no greater than had been found to arise in the ordinary process of manufacture of sulphate of ammonia as previously carried on in the same works. As an example of one of the latter, I insert extracts of a letter I received in December last from Mr. W. B. McLusky, Halifax:—

"You will be pleased to know that the quantity of concentrated ammonia liquor recovered and available for sale during the eight months ending November 30, 1918, was equal to 30.54lb. of 24½ per cent. commercial sulphate of ammonia per ton of coal carbonised, as compared with an average of 25.31lb. for the previous 10 years on sulphate of ammonia manufacture, and 24.78lb. for the year 1917-18 on concentrated liquor production. The increase for the past eight months has been obtained despite the admixture of 31.9 per cent. of Durham coal."

"Owing to the irregularity in the size of coal received, the thickness of the charge of coal laid on the floor of the inclined retorts varies considerably. The percentage of ash in the various grades of coal also varies to a large extent, and the quality of the coal is variable, containing at times as much as four hundredweights of foreign matter per ton. Therefore our results vary considerably from week to week, and it has been difficult to fix the cause of the improvement in ammonia returns."

"Durham coal is very dry, and we have used the water-spray consistently; and we attribute the improved returns to this damping of coal and coal-dust, which has the effect of rolling the powder into moist nodules. The charge of coal in the retort is therefore more open, the interstices larger, and the steam generated not only keeps the charge more or less in a state of movement, but the puffing of the steam from the

interstices as the carbonising of the coal proceeds tends to form a protective envelope between the hot walls of the retort and the gas."

The use of steam in coal carbonising has, of course, long been recognised as a means for increasing the proportion of ammonia recovered, and this is one more instance of advantage so gained; but the high yield of an equivalent of 30.54lb. per ton of coal could only have been reached with an efficient plant for producing concentrated liquor, whilst the increase of the 1918 figures over those for the previous year point to increased efficiency from accumulated experience.

The loss of ammonia during handling and storing of ordinary liquor, referred to in the report for 1915, is naturally of much greater importance in the case of concentrated liquor.

UTILISATION OF NITRE-CAKE.

Dr. Fryer, in his report on District VIa., refers to the successful utilisation of nitre-cake for manufacture of sulphate of ammonia in the following terms:—

"It has been found easy of application to the present sulphate of ammonia plant. A suitable lead-lined box provided with grid and lead steam coils is the only extra plant required. A nitre-cake solution with an approximate content of 6 per cent. sulphuric acid is made by dissolving nitre-cake in water. The solution is fed to the saturator along with the acid in certain fixed proportions. The ammonia and steam passing forward from the stills in the case of ordinary sulphate of ammonia plants, or the ammonia with the coke-oven gas in the direct and semi-direct plants, enters the saturator; absorption of ammonia takes place, and the specific gravity begins to increase. After a time deposition of sodium sulphate containing some of the corresponding ammonium salt takes place. At this stage of the operation an excess of back pressure gradually begins to be thrown by the liquor in the saturator, and this is the signal for the ejection of some of the saturator liquor into the mother liquor well. Following the latter operation, the supply of acid and nitre-cake solution to the saturator is resumed till the normal level of the bath has been restored. Meanwhile, the solution discharged to the mother liquor well is cooling, and on reaching 46° C. practically the whole of the sodium sulphate will crystallise out. The specifically lighter mother liquor containing ammonium bisulphate and lesser quantities of sodium bisulphate is again injected to the saturator, and so a definite cycle of operations is established. The management of the Llwynypia by-products works of the Glamorganshire Coal Company have adopted this method of manufacture for over a year, and are well satisfied with the results obtained."

Owing to the diminished supplies of available male labour, women were employed to a considerable extent in many gasworks. The operation of the sulphate of ammonia plant was one of the numerous directions in which women efficiently carried out the necessary duties.

"DIRECT PROCESS" OF SULPHATE MAKING.

The working of plant for the manufacture of sulphate of ammonia by the "Direct Process" has been the subject of special study and research during the past four years. In these investigations typical plants have been kept under continual observation with a view to ascertain the causes of the periods of disorganisation which characterised the process at its inception. The conclusions arrived at from a study of the data furnished by this research have enabled various suggestions to be made for a more scientific control of purifier working, by regulation of temperature, ammonia content of crude gas, and humidity of oxide, and a reduction of working losses by better circulation of acid liquor in the "Bubbler," and more careful attention to the working of the virgin liquor still.

With respect to working losses generally, which are still regarded as exceptionally great at many of the works operating plant of the "Direct" type, further experience tends to confirm the conclusion arrived at in 1916—that too little attention is paid whilst distilling the virgin liquor to the due adjustment of the lime and liquor feeds; the ammonia content of virgin liquor is by no means a constant quantity, nor is the quality of the lime always beyond reproach; moreover, the advantage of a continuous lime feed is insufficiently appreciated, even at works where the scale of operations would fully justify its adoption. The following figures are of significance as indicating the difficulty of safeguarding losses in the effluent spent liquor from the still, even where samples are systematically submitted to analysis in the laboratory, and where in other respects the control of operations leaves nothing to be desired.

AMMONIA LOSSES,
AT PURIFIER AND STILL.

Entering Purifier.			In Effluent Spent Liquor.		
Date of Test.	Ammonia Grains per 100 Cubic Feet.	Equivalent to lbs. S/a per Ton Coal.*	Average for Month.	Ammonia Parts per 100.	Equivalent to lbs. S/a per Ton Coal.†
April			April	0.102	1.6
May			May	0.090	1.4
June 13th	0.5	0.04	June	Idle	—
„ 17th	1.2	0.09	July	Idle	—
July 3rd	2.0	0.14	August	0.114	1.7
„ 30th	6.1	0.46			
August 8th	8.0	0.58			
„ 20th	5.0	0.36

NOTE.—* Taking 13,000 c.f. of gas per ton coal. A varying proportion of the NH_3 entering purifier is recovered in the condensed liquor
† Taking 40 gallons effluent per ton coal.

At three works the function performed by the "neutralising box" has been effected in a simpler manner, and at less cost, by the introduction of what may be termed a "neutralising pipe" in the "Bubbler." This pipe enables vapours from the ammonia still to be delivered direct to a point just above the bottom of the "Bubbler," which in this respect performs the function of a saturator. Very favourable reports have been received respecting the efficiency of this device, and its continued working will be watched with interest.

Picric Acid Works.

The number of registered works of this class fell from 21 in 1917 to 15 in 1918. In those works continuing upon the register a great fall-off in operations followed the completion of the armistice.

In the earlier part of the year recovery towers were brought into more extended use for recovery of nitric acid, which reduced the proportion of noxious gases discharged. Improved methods of manufacture were developed and brought into successful operation, but with the cessation of war conditions the future requirements of picric acid will be small.

Tar Works.

The number of registered works of this class was 375, an increase of 15 over 1917.

Owing to difficulties of transport and labour the stocks of pitch were unduly heavy in some localities, whilst in others there was an active demand.

The erection of tar dehydrating plants in gasworks continued to extend, whilst plants for the full distillation of tar also increased in number. In two works plant of the continuous type for distillation to pitch were in course of erection at the end of the year.

Through the courtesy of the owners, the Chief Inspector is again enabled to give some particulars as regards the operations carried on in these works throughout the United Kingdom:—

Tar distilled in:—	Tons.
Gas and coke oven works	1,510,065
Other works	131,325
Pitch produced in:—	
Gas and coke oven works	720,527
Other works	71,237

ALKALI WORKS IN SCOTLAND.

The number of works registered in Scotland was 166, a decrease of two from 1917. In many of these works more than one registered process was in operation. The number of these processes was 321, an increase of four over 1917. Of these 321 processes, 6 were alkali (saltcake), 2 alkali (wet copper process), 3 smelting, 19 sulphuric acid, 19 sulphuric acid (Class II.), 30 chemical manure, 13 gas liquor, 8 nitric acid, 109 sulphate and muriate of ammonia, 2 chlorine, 4 muriatic acid, 15 sulphide, 2 alkali waste, 13 lead deposit, 2 arsenic, 7 nitrate and chloride of iron, 1 bisulphide of carbon, 1 picric acid, 5 paraffin oil, 8 bisulphite, 50 tar, and 2 zinc extraction.

Alkali Works.

The registered works of this class remained unchanged in number or condition. They were conducted in a satisfactory way throughout the year. The use of mechanical furnaces continued to give satisfaction, alike as regards costs and as regards the maintenance of minimum escapes of acid gases at the furnaces. As in the majority of the works the operations

do not proceed beyond the production of saltcake and hydrochloric acid, there is not the same opportunity of introducing electrolytic methods which produce in a direct way caustic alkali and chlorine.

Attention continued to be given to the alkali waste heap which in the recent past gave cause for special consideration, and improved conditions were maintained during the year.

The average amounts of muriatic acid escaping per cubic foot of chimney gases were: Maximum from any one works, 0.146 grain; minimum from any one works, 0.024 grain; average for the district, 0.058 grain.

Smelting Works.

The acidity of the chimney gases discharged from the three registered works of this class was very slightly higher than in 1917. Operations were restricted owing to scarcity of the requisite raw materials, so that the total volume of chimney gases discharged was smaller. Very slow progress was made with the erection of plant, referred to in the report for 1917, for the manufacture of sulphuric acid from the acid gases developed during the calcination of zinc sulphide ores, and it was not completed at the end of the year.

The average amounts of total acidity per cubic foot of chimney gases were: Maximum from any one works, 1.58 grain SO_3 ; minimum from any one works, 0.10 grain SO_3 ; average for the district, 1.03 grain SO_3 .

Sulphuric Acid Works.

The pressure upon this class of works for maximum output was lessened, and permitted of greater opportunity for repair and reconstruction of plant, of which advantage was taken to effect extensive improvement.

In one works the trial of a combination of an intensive working section and an ordinary chamber section did not give the improved results looked for.

One of the units of the sulphuric acid plant at a registered works was provided with an oxide of iron contact tower placed between the burners and the Glover tower. This was brought into operation in the course of the year, and was accompanied with a reduction by one-third of the nitre required to work the process. This is, so far, a satisfactory feature, and the further experience from continued working of this unit will be watched with interest.

The system referred to in the report for 1917 of a more complete observation of the chamber process by testing the gases at successive stages had to be relinquished in part, owing to unusual and excessive demands upon the chemical staff from other departments in the works in question. It is hoped, however, that this subject will again be taken up and applied even more fully than had previously been the case.

The average amounts of total acidity per cubic foot of residual gases discharged were: Maximum from any one works, 1.61 grain SO_3 ; minimum from any one works, 0.26 grain SO_3 ; average for the district, 0.76 grain SO_3 .

Sulphuric Acid (Class II.) Works.

CONTACT PROCESS WORKS.

Works using three types of contact plant continued in satisfactory operation. In one works a new platinum contact plant was put into operation, which gave much cause for anxiety. When started it gave rise to local complaint of excessive discharge of acid gases, and was not efficient as a producer of "oleum." It was only kept temporarily in operation, and is not working for the present.

CONCENTRATION PROCESS WORKS.

Kessler, Gaillard, cascade and glass retort plants continued in operation without any change in the means for preventing undue escape of acid gases. The acidity of the gases discharged into the atmosphere was in all cases well below the maximum of 1.5 grain SO_3 per cubic foot recognised by the Act.

In two cases, however, complaints were made of annoyance from discharged fumes. In one case the chimney receiving the waste gases from acid concentration was increased in height and means taken to increase the volume of discharge from the chimney by dilution with air, in order still further to reduce the proportion of acid present, although it was already well below Act requirements. In the second case, owing to a defective flue, there was some low-level escape. The owners at once stopped operations and put the plant into order, which completely removed all cause of dissatisfaction.

The average amounts of total acidity per cubic foot of chimney gases in those works in which a chimney was used

were: Maximum from any one works, 0.85 grain SO_2 ; minimum from any one works, 0.27 grain SO_2 ; average for the district, 0.55 grain SO_2 . The average amounts of total acidity per cubic foot of residual gases from those works in which a separate outlet was used were: Maximum from any one work, 1.01 grain SO_3 ; minimum from any one works, 0.23 grain SO_3 ; average for the district, 0.57 grain SO_3 .

Chemical Manure Works.

The number of registered works of this class was 30, a reduction of one from 1917. Although the number of works was less, the production of chemical manure was much greater, and materially exceeded that for 1917, which was quite up to the pre-war figure. Indeed, the quantity of 76,800 tons of phosphates and bones dissolved for this manufacture is the largest on record for Scotland.

A further increase in the use of mechanical dens was made, a development to be welcomed, improving as they do alike the conditions inside the works with capacity for production.

The treatment of the noxious gases evolved continued to be satisfactory, save, temporarily, in one works, where, owing to failure of certain luted connections, an escape of noxious gases occurred. The fault was quickly remedied, and the normal satisfactory conditions reinstated.

Sulphate and Muriate of Ammonia and Gas Liquor Works.

The number of these two associated classes of work increased by two, two additional being registered as gas-liquor works, whilst the sulphate and muriate of ammonia works remained unchanged.

The means for preventing undue escape of noxious gases remained in use without alteration, and were maintained in satisfactory condition.

The requirements of concentrated liquor for munition purposes led to activity in the gas-liquor works for the greater portion of the year; but with the cessation of active military operations these requirements no longer continued on so extensive a scale, and towards the end of the year there was in many such works a return to the manufacture of sulphate of ammonia.

Nitric Acid Works.

These works continued in active operation for the greater part of the year, but the altered position in November, as regards munition requirements, materially lessened the demand for nitric acid.

In one works the oxidation of ammonia to oxides of nitrogen by a catalytic method was successfully applied to the manufacture of nitrates, but the altered position at the end of the year led to the stoppage of these operations. In this case, as in the others, the prevention of atmospheric pollution was adequately and satisfactorily effected.

Zinc Works.

One of the two registered works of this class required much attention. Notwithstanding the value of material recoverable from the fumes discharged into the air, the use of suitable appliances was not regularly maintained, chiefly owing to labour difficulties. As a consequence, the amount of fume permitted to escape left much room for improvement.

UTILISATION OF WASTE SULPHITE LYES.

THE problem of effecting the utilisation of the waste sulphite liquors resulting from the wood pulp industry in Canada is dealt with in a publication prepared by the Forestry Branch of the Canadian Department of the Interior. The first difficulty in complete utilisation of the liquor is presented by the fact that only about 40 per cent. of the total liquor will drain off from the pulp without special arrangements for forced draining, and even with such equipment it would probably be difficult to recover more than 60 per cent. The remaining portions must be removed by water, which means a further dilution, and therefore an appreciable increase of the volume; requiring large-sized apparatus for handling. It is of great interest, therefore, to prevent a further dilution of the already very dilute liquor, as most of the processes of utilisation call for a concentration of the liquor. The fact that the economy of many of these processes largely depends upon the cost of evaporation—as the ten tons of liquor obtained per ton of pulp contain only 11 to 12 per cent. of solid substances—has made the question of evaporation one of the most important in the discussion of the waste

sulphite liquor problem. Various methods of evaporation which are as a rule carried out in connection with the simultaneous recovery of sulphurous acid are discussed.

The manufacture of ethyl alcohol from waste sulphite liquor is described, and the calculations, which are based upon the experience of operating sulphite spirit plants, give a manufacturing cost of 0.185 dols. to 0.32 dols. per Imperial gallon, which is considerably less than the cost of production of alcohol from grain. The main question is, therefore, whether there is a sufficient market for this alcohol, which without special purification contains certain impurities, especially methyl alcohol (about 3 per cent.). Canada produced in the calendar year 1916, 7.5 million gallons of crude petroleum valued at 392,300 dols. The imports of crude and refined petroleum were about 290 million gallons valued at about 14,000,000 dols. It can be seen that Canada is dependent on foreign sources for her supplies of petroleum and petroleum products. In 1916 the imports of refined and illuminating oils amounted to over 8,000,000 gallons valued at 540,000 dols., and during the same year 18,000,000 gallons of gasoline were imported. If industrial alcohol could be produced economically in Canada it would mean a saving in imports of over 4,000,000 dols. On the basis of a manufacturing cost of 0.185 dols. to 0.32 dols. per Imperial gallon for 100 per cent. alcohol from waste sulphite liquor there ought to be some hope, if suitable markets and legislation were provided, to introduce this alcohol for industrial purposes. The total production of alcohol from waste sulphite liquor would be about 3,320,000 gallons of absolute alcohol, which would assist in freeing Canada from dependence on foreign sources as well as utilise a waste product.

The manufacture of alcohol from waste sulphite liquor does not solve the waste liquor problem completely, as only about 15-20 per cent. of the total solid of the liquor is utilised. But the residual liquor from the alcohol process may be further used in the production of binding material, fuel, or using the dry substances for destructive distillation. The use of waste sulphite liquor products for cattle food has not given very satisfactory results, and as a fertiliser the waste liquor has only an indirect value, as it contains the chief chemicals required of a good fertiliser, namely, nitrogen and phosphate, in very small quantities. It may, however, be useful in mixture with other products such as cyanamide, and may improve a soil poor in humus on account of its organic substances, which form a good medium for the growth of nitrogen-fixing bacteria.

As a mordant the sulphite lignin, or more correctly the substances precipitated by albumin or gelatine or salted out with sulphate or chloride of sodium, have been proposed under names such as lignosin and lignorocin. Of theoretical interest, but as yet without any practical value, are the condensation products with aromatic amines and the preparation of azo-dyes by coupling aromatic di-azo compounds with lignin sulphonic acid or its salts, obtained from waste sulphite liquor.

Recently it was suggested that sulphur dyestuffs might be prepared by heating sulphonic acids or sulphonates with alkali sulphides or other sulphur-containing substances, dissolving the product in water and precipitating with acid, but all the attempts in producing dyestuffs from the waste sulphite liquor are still limited to laboratory experiments.

The precipitation of organic substances at high temperature and pressure, for use as a fuel or for destructive distillation, is probably, in the present form, not of immediate interest to Canada, but the development of this very interesting process should be followed by the sulphite pulp manufacturers.

PRICES OF OIL CAKES.—The Board of Agriculture give the following maximum prices per ton, ex mill to farmer, for home-manufactured cakes and meals: Linseed cake, containing from 8 to 10 per cent. oil, £25.; cottonseed cake (black), £20.; cottonseed cake (white), £19. 10s.; extracted palm-kernel meal (in bags), gross weight, £17.; ground-nut cake, decorticated, £24.; semi-decorticated, £22.; undecorticated, £21.; soya cake, £25.; extracted soya meal (in bags), gross weight, £25.; cocoanut cake (in bulk), £21.; rape cake, £18.; extracted rope meal (in bags), gross weight, £18.; sesame cake, £23. 10s. The above prices are net cash per ton, ex mill Hull, London, Bristol, and Liverpool, to the farmer. All distributing commissions to intermediaries are to be included in the above prices.

CHEMICAL INDUSTRIES OF INDIA.*

By DR. J. J. SUDBOROUGH AND DR. J. L. SIMONSEN.

(Concluded from page 144.)

Sodium Salts.

REFERENCE has already been made to three sodium derivatives—sodium carbonate and caustic soda and common salt (sodium chloride). Other salts to which attention may be directed are sodium sulphate and sodium silicate.

Sodium sulphate, or Glauber's salt, is already made in India in considerable quantity. It is obtained as a by-product in the manufacture of carbon dioxide (for soda water), which is prepared by treating sodium carbonate with sulphuric acid. Large quantities are also obtained as a by-product in salt-petre refining in Bihar. It may also prove possible to obtain it from bitters. Glauber's salt is used largely in cotton mills, in the manufacture of glass, and for dehydrating oils such as turpentine.

Sodium silicate is chiefly used in soap manufacture as a filling agent. It is prepared by treating sand with alkali under suitable conditions, and it is understood that it is now being made in Bombay on a small scale. The possibility of its being manufactured on a large scale in India would appear to be dependent on a cheap supply of fuel and alkali.

Potassium Salts.

The only potassium compound which occurs in large quantities in India is saltpetre. Appreciable amounts of this are recovered from old village sites in Bihar and the Punjab. The product obtained from the local refineries always contains at least 5 per cent. of common salt, and frequently as much as 20 or 30 per cent. This crude product was exported to France and other countries, where it was refined. A certain amount is now being converted into pure nitrate in Calcutta, but it is probable that, with more care and scientific supervision, it would be possible to produce in the local refineries a product containing 99.5 per cent. of potassium nitrate at much the same cost as it takes to produce 80 or 95 per cent. nitrate. Occasional occurrences of potassium salts are found in the Salt Range, but these are too small and irregular for commercial exploitation. Possible sources in the future are (a) potash feldspar, (b) ashes of plants such as the water hyacinth, (c) the ash from coconut shells, (d) the liquors from wool washing, (e) the gases from blast furnaces and from the flues of coke ovens. It is more probable, however, that acid potassium sulphate, obtained as a by-product in the manufacture of nitric acid, will provide a sufficient source of supply.

The chief salts for which there is a market are potassium carbonate (already made in some quantity), caustic potash, potassium chloride, and chlorate.

The carbonate is manufactured in India by igniting the nitrate with loss of the valuable oxides of nitrogen. The process is extremely wasteful, and is unlikely to meet with success in time of peace, unless the oxides of nitrogen can be utilised. Small quantities of the chloride have recently been made in Bengal from the ash of the water hyacinth, but it is doubtful if this method could compete with the high-grade chloride obtainable from extensive natural deposits in Italian East Africa. The quantity obtainable from the former source is also not unlimited. It is mainly required for use as a fertiliser for jute.

The manufacture of potassium chlorate would also probably prove remunerative, as the demand is likely to increase with expansion of the match-making industry.

Magnesium Salts.

Apart from magnesium carbonate or magnesite, there are two salts of magnesium of technical importance—namely, magnesium chloride and magnesium sulphate. These two salts can be obtained readily from bitters. This source of supply is already being exploited by one firm of chemical manufacturers for the production of magnesium chloride. Their product, however, is not by any means a satisfactory article, and frequently contains considerable quantities of other salts. With unlimited supplies of raw material available, there should be, under scientific supervision, little difficulty in placing a pure product on the market.

Magnesium sulphate, or epsom salts, can also be obtained from the bitters, but so far this has not been attempted on the large scale. The salt has been made from magnesite by treatment with sulphuric acid—an uneconomic process, and one which it will not pay to continue after the war, unless the carbon dioxide can be collected and sold, and unless the sul-

phuric acid can be obtained at a cheaper rate, as the value of the acid required is greater than that of the salt obtained.

Zinc Salts.

When the distillation of the zinc concentrates from Burma is undertaken in Singhbhum, the manufacture in India of the various zinc derivatives of technical value could be developed without difficulty. The three most important are zinc oxide, zinc sulphate, and zinc chloride. This last is already being manufactured on a considerable scale, in solution, and about two hundredweights of the anhydrous salt have been prepared in the form of sticks for medicinal purposes. It finds its chief application in cotton mills, for preserving wood, for making soldering solution, and is also used as a disinfectant and deodorant and in medicine as a caustic. In the manufacture of white vitriol and also of zinc chloride, crude hydrogen is produced as a by-product, and the cost of the salts would be reduced if use were made of this hydrogen. It would not repay to purify it for the purpose of hydrogenating oils, although it could be burnt and used for generating steam or for concentrating solutions. The successful production of these salts depends largely upon the cost of fuel and also of sulphuric and hydrochloric acids.

Alums.

The local extraction of aluminium sulphate and the manufacture thereof of alums has long been an Indian industry. Aluminium sulphate is extracted from pyritic shale, which is found mainly in the Punjab. The shales contain about 9 per cent. of sulphur, and the aluminium sulphate is extracted by roasting the shale, lixiviating and concentrating the crude aluminium sulphate solution. A mixture of crude chlorides, nitrates and sulphates of sodium, and potassium is then added, and the alum crystallised. The product is mainly soda alum, and finds its chief market in the Delhi district, where it is used in the tanning and dyeing industries. Crude aluminium sulphate, "alum cake," is also being made by several chemical firms in India from bauxite, but unless the present price of sulphuric acid is very much reduced there would appear to be little prospect of this product competing with the imported article. It is largely used for water purification. Alum is also used for paper-sizing and in medicine.

Lead Salts.

With large supplies of lead readily obtainable from Burma, the manufacture of the various lead derivatives of commercial value should be an industry capable of considerable expansion. Litharge and red lead, both of value as pigments, are already being made on a considerable scale. The manufacture of white lead, probably the most important of all pigments, has not as yet been undertaken. The experiments which have been made on this subject by Drs. Sudborough and Watson at the Indian Institute of Science have now practically reached completion, and it is possible that they will shortly be developed on a technical scale. The method adopted is a modification of a German patent, and utilises metallic lead and acetic acid as the starting material, with a periodic replacement of small amounts of acetic acid lost in the process.

Chromium Salts.

Owing to the increased demands for chromium for metallurgical purposes, the internal and external demands for chrome iron ore are gradually increasing, and the sources of supply being rapidly opened up. The chief deposits of chrome iron ore are in Mysore, Baluchistan, and Singhbhum. Attempts on a comparatively small scale have been made to manufacture the various chromium salts, such as sodium and potassium chromates, dichromates and alums, which are of technical importance, being used in chrome leather manufacture and in khaki dyeing. There should be no difficulty in making these products in India, provided cheap fuel, sodium carbonate, and potassium carbonate are available. For manufacturing sodium chromate the finely divided ore is roasted in a reverberatory furnace for several hours with lime and sodium carbonate, the resulting mass extracted with water and the aqueous solution evaporated.

Within the last few years appreciable quantities of chrome tanning liquor have been made in India from imported sodium dichromate, sulphuric acid, and jaggery. It should be possible to make products of the nature of "tannolin" in India.

Lead chromate is also of commercial value as a yellow pigment, and could easily be produced if sodium chromate were manufactured in the country, as it is prepared by precipitating a solution of lead acetate with one of sodium chromate.

* Indian Munitions Board Industrial Handbook, 1919.

It is largely used as a pigment, and also in calico printing, and is the chief constituent of all the members of the group of chrome yellows—e.g., Cologne yellow, Paris yellow, and Leipzig yellow. By mixing with Prussian blue, these yellows give the Brunswick greens; and by treatment with alkali, various orange and red pigments—e.g., Chinese red and American vermilion.

Although the imports are comparatively small, the demands for chromium salts for chrome leather tanning are likely to increase, and the manufacture of these salts in India in quantity sufficient to meet the Indian demands and also for export appears to be worthy of consideration.

Iron Salts.

The only iron salt manufactured in India on a large scale is ferrous sulphate or copperas, which is prepared by treating scrap iron with warm dilute sulphuric acid. This salt is largely used in dyeing and tanning and in the manufacture of inks, Prussian blue, and other pigments. The production in India has developed since the outbreak of war, and as a result the imports have shown a large diminution. The success of the manufacture after the war will depend solely on a cheap supply of sulphuric acid being available. The present output is approximately 1,000 tons per annum.

Cyanides and Ferro-cyanides.

In view of the dependence of the gold mines on an adequate supply of either sodium or potassium cyanide, it would appear to be highly desirable that the manufacture should be undertaken locally. One method adopted is to treat a mixture of sodium or potassium carbonate and charcoal with ammonia gas under suitable conditions (Beilby's method), whilst another is to fuse nitrolim with salt. The latter method, which yields a crude product (30 per cent. sodium cyanide) suitable for gold extraction, might prove the more suitable if the manufacture of nitrolim is undertaken in India.

It would appear to be very doubtful if the preparation of ferro-cyanides could with advantage be undertaken in India. The ferro-cyanides are obtained as by-products in gasworks, and the price is therefore extremely low. Small quantities of potassium ferro-cyanide have been made in India by the old method from horns and old organic matter. This process would not appear to be likely to be remunerative after the war, as the yields are always poor. The ferro-cyanides are mainly used for the manufacture of pigments, such as Prussian blue.

Acetic Acid.

The world's chief source of acetic acid is the crude pyroligneous acid produced during the destructive distillation of wood. The crude acid is redistilled, neutralised with lime and the solid calcium acetate, heated preferably under reduced pressure, with sulphuric acid. As the number of wood distillation factories has increased, it is probable that after the war the supply of acetic acid and acetates from pyroligneous acid will be large and prices low.

Numerous experiments have been made in recent years on the production of acetic acid from other sources, and a large number of patents have been taken out. A method which appears to have commercial possibilities is the conversion of acetylene made from calcium carbide into acetaldehyde by the addition of water in the presence of small amounts of mercury salts, and the subsequent catalytic oxidation of the aldehyde to acetic acid. This method is of no value in India unless calcium carbide is manufactured in the country at a low cost.

Another process consists in passing alcohol vapour and air over a catalyst, such as metallic copper, condensing the acetaldehyde, and oxidising this by atmospheric oxygen in the presence of a catalyst. In a hot climate like that of India, the cost of condensing the volatile aldehyde vapour would be a disadvantage.

The oxidation of alcohol to acetic acid by means of sodium dichromate and sulphuric acid, and the subsequent recovery of the dichromate by electrolytic oxidation, has been studied by Mr. Usher in Bangalore.

Methyl Alcohol.

Crude methyl alcohol, known under the name of wood spirit, is one of the by-products obtained from wood distillation factories. It is usually obtained by neutralising the redistilled pyroligneous acid with lime, and distilling the neutralised liquid in steam-heated pans provided with fractionating columns. At present it is not produced in India, but immediately wood distillation plants are installed appreciable amounts should be available. The normal pre-

war price in England was Rs. 1.12 per gallon, but in 1918 the price had risen to Rs. 12.8 per gallon. Very large amounts have been produced in Europe and America. The average yearly import for the period 1913-15 into Great Britain was more than half a million gallons.

One of the chief uses of wood spirits is as a solvent, more particularly in the manufacture of spirit varnishes. Enormous quantities are also used as a denaturant for alcohol. The product known as methylated spirit usually contains 90 per cent. of rectified spirits and about 10 per cent. of wood spirits, together with small amounts of such substances as pyridine. Wood spirit is not used as a denaturant in India, probably owing to its scarcity. If manufactured in the country, appreciable amounts might be used for this purpose.

Since the outbreak of war oxalic acid has been manufactured on a small scale in India by fusing sawdust with caustic soda, whilst a patent for its extraction from "sal" bark, the fibrous bark of *Shorea robusta*, has also been taken out. The lack of a cheap supply of caustic soda and caustic potash has probably retarded any extensive manufacture from sawdust in India. In Europe it is now as a rule manufactured from sodium formate, which is cheaply prepared by treating sodium carbonate and lime under pressure with power gas rich in carbon monoxide.

Formic and oxalic acids and their salts are used mainly in the dyeing industries and for medicinal purposes. Within the last few years appreciable quantities of formic acid have been used in dye works and tanneries owing to the difficulty of obtaining lactic acid.

Citric Acid.

It would appear probable that the manufacture of citric acid could be undertaken with advantage in India, provided that limes were cultivated in plantations for the purpose, and the juice collected in a central refinery, where it could be worked up in large quantities and the essential oil also extracted. A cheap supply of sulphuric acid would also be requisite for success, since the acid is purified by conversion into the calcium salt, which is decomposed by the addition of the necessary quantity of sulphuric acid. The imports of citric acid are not large, and it would be necessary to export a portion of the products of the factory.

Tartaric Acid.

Tartaric acid is manufactured in Europe from by-products obtained in the manufacture of wines by the fermentation of grape juice. The two chief sources are "argol," or slightly impure potassium hydrogen tartrate, which separates as crystalline crusts on the sides of the vats and "lees," which is highly impure potassium hydrogen tartrate mixed with yeast and various other organic substances. The higher grades of argol are usually recrystallised, and thus yield the pure potassium hydrogen salt known commercially as "cream of tartar," whereas the lees and the lower grades of argol are used for manufacturing the free acid.

These sources are not available in India, and the only material which appears to be at all suitable is the pulp of the tamarind fruit. This pulp contains about 12 per cent. of tartaric acid, mainly in the form of the free acid, but partly as the potassium hydrogen salt. Small quantities have been prepared from this source, but its production in larger quantities could only be profitable in normal times if the pulp could be obtained at an extremely low price. It is possible that its manufacture in Indore, where tamarinds can be bought at about Rs. 1 to Rs. 1.5 per cwt., might pay. The pulp, as regards its tartaric acid content, is only comparable with low-grade "lees," as many of these contain 25 to 30 per cent. of tartaric acid, and the method of manufacture would probably be similar.

CITY AND GUILDS INSTITUTE.—The Council of the City and Guilds of London Institute has awarded Diplomas of Associate to the following students who have completed a full course of instruction at the close of the present session: In Engineering, to students of the City and Guilds (Engineering) College: J. de Aguiar, R. H. Barfield, J. A. A. Best, C. Grad, A. G. Griffith, T. J. Griffiths, F. St. A. Hartley, G. H. Hopewell, E. W. A. Janmouille (Siemens Medal), A. A. de Lemos, K. P. P. Menon, R. B. McC. Potter, J. H. Reyner (Henrici Medal), C. J. H. Trutch, S. Vaughan, A. C. Warren (Henrici Medal), H. C. Wilkinson, E. W. Workman, and R. G. P. Wyatt (Branwell Medal). In Applied Chemistry to students of the City and Guilds Technical College, Finsbury: E. Fisher, J. R. Fraser, F. D. M. Hocking, S. J. Hopkins, L. Mendel, N. Plotzker, N. Singer, C. E. Spearing, H. G. Tribble, and H. B. Williams.

SULPHUR SITUATION IN NORWAY AND SWEDEN.

Norway.

ALTHOUGH there are no deposits of native or pure sulphur in Norway, the large deposits of iron and copper pyrites overcome the deficiency in many respects. While pyrites constitute one of the leading exports from Norway, they are also extensively used in connection with the sulphite paper-pulp industry. The introduction of the pyrites process has been progressing rapidly among Norwegian sulphite pulp mills since 1904, and now it is reported that the greater number of the mills are so equipped, and hence normally use pyrites instead of sulphur. Some conception of the use of pyrites in Norway may be obtained from the following figures showing in metric tons the production of pyrites (including cuprous pyrites of low copper content—from 2 to 4 per cent.): 1911, 369,055; 1912, 464,326; 1913, 441,291; 1914, 414,886; 1915, 513,335. Production statistics subsequent to 1915 are not available, but it is quite certain that the annual production has been at least as great as in that year, inasmuch as the markets called for all the pyrites obtainable, and at relatively high prices.

During the war the exports of pyrites did not keep pace with the increased production. This signifies that the domestic use of pyrites increased quite sharply after 1914. This fact must be kept in mind when interpreting the decreased sulphur imports during the same period. Exports of pyrites during the last five years were, in metric tons, as follows: 1914, 360,228; 1915, 466,759; 1916, 253,362; 1917, 212,909; 1918, 240,774.

The pre-war use of sulphur was almost twice as large as the use since 1914. In this connection, however, two qualifying influences must be considered: In the first place, the decreased use of sulphur was undoubtedly due in part to the substitution of pyrites for it in the pulp mills, and also to the use of substitutes in other lines, because of the sharply advancing prices of sulphur since 1914. Secondly, however, there is a probability that the stocks of sulphur in the country have been almost completely wiped out since 1914, and thus the actual use since that date has been somewhat greater than the records indicate. The average annual imports, 1910-1914, were 11,746 metric tons, while the average annual imports, 1915-1918, were only 5,294 metric tons. Prior to the outbreak of the war the principal sources of supply were Great Britain, Italy, and Spain, while during 1915 and 1916 Great Britain and Italy furnished almost the whole supply. Detailed statistics are not available since 1916, but it is known that in 1918 the United States furnished more than 50 per cent. of the imports.

The greater part of the sulphur imports are used by the sulphite mills which are still employing the sulphur process. Statements made by engineers as to the total quantity of sulphur needed by these mills annually vary from 4,000 to 8,000 tons. It seems very probable that the demand for sulphur by the sulphite mills, if operating at abnormal capacity, would be between 4,000 and 5,000 tons. Minor sulphur-using industries, such as explosives and chemical industries, are estimated to use approximately 2,000 tons. From this it appears that the probable consumption, and hence the import demand of sulphur, is about 7,000 tons. Inasmuch as the sulphite mills constitute the leading market and are the most prominent importers of sulphur, it is to them that sulphur exporters must turn for their largest market.

The present situation of the sulphur market is one of uncertainty, because of several factors. It is reported that Italian sulphur has been offered, but prices have not been made public. It is very probable that British sulphur will again become available, and if so, the nearness to the Norwegian market is, of course, a very large factor to its advantage. Finally, the sulphite mills are facing difficulties with respect to marketing their products. Conditions in the sulphite pulp industry have been growing steadily worse since January, until now there are rumours that extensive shut-downs are probable. If these should occur, they would, of course, automatically close the largest sulphur market in the country. Until these conditions become settled, conservatism in buying large quantities of supplies may be expected. On the other hand, should the sulphite pulp situation be relieved, it seems certain that an active market for fairly large quantities of sulphur may be expected in Norway.

Sweden.

The pre-war consumption of sulphur in Sweden was about 40,000 tons yearly, for which supply consumers were entirely dependent upon imports, there being no domestic production. As a result of conditions brought on by the war, the state of the Swedish sulphur market is more or less uncertain, and future consumption depends primarily upon the price quoted.

The principal consumer of sulphur in Sweden is the cellulose industry, whose supply is purchased by a centralised society, known as the Pappersbrukföreningen. The quantity used by the chemical and match industries is small, amounting to a few thousand tons yearly.

Formerly the bulk of Sweden's imports of sulphur came from Sicily, some came from Great Britain. At present great interest is being exhibited as to the ability of America to enter the market with the proper price requirements. It has been mentioned that Japan also will soon enter the market, thus adding a new factor.

Due to the great increase in price and the difficulty of obtaining sulphur the great majority of the cellulose factories have been readjusted. These plants found it necessary to make use of the Norwegian pyrites, and they are now so equipped that they can use either pure sulphur or pyrites. Cellulose manufacturers expect to continue on their existing contracts for pyrites unless there is a reduction in the price of pure sulphur.—*U.S. Com. Reps.*

INDUSTRIAL SYNTHETIC AMMONIA.

IN a communication presented recently to the Académie des Sciences, M. Georges Claude, well known by his work on the liquefaction of gases and the isolation of the rare gases, submits some considerations as to the future of the synthetic ammonia industry, which has taken so extraordinary a development during the war. In peace time, he points out, the object of the fixation of atmospheric nitrogen is essentially the manufacture of fertilisers. In the shape of liquid, ammonia is useless as fertiliser, and difficult to transport; the nitrate is valuable, but expensive; in the shape of sulphate, ammonia can be transported, but the sulphuric acid used for binding the ammonia is useless in the fertiliser, and thus a considerable fraction of the sulphuric acid manufactured is practically wasted. To reduce this cost, German chemists have, according to the reports of French chemical delegates, worked out a process of converting gypsum into ammonium sulphate. But we need not depend upon sulphate. According to Georges Ville, ammonium chloride is, as fertiliser, at least equal to the sulphate, and is less heavy and expensive in transport. Little would be gained, however, if the ammonia prepared were to be bound by hydrochloric acid instead of sulphuric acid. There is the ammonia-soda process successfully introduced by Solvay about fifty years ago after many failures. In this process large quantities of sodium chloride (brine) are decomposed with the aid of ammonia and carbon dioxide precipitating sodium bicarbonate; the carbon dioxide is recovered by heating the bicarbonate, and the ammonia is recovered by boiling the ammonium chloride with lime. The recovery is fairly complete, but the resulting calcium chloride is a troublesome waste product, often a nuisance. If it were not for this well-known fact, the ammonia-soda process, which has largely superseded the Leblanc process, would be almost supreme. What Claude now proposes is to separate and to precipitate both the sodium bicarbonate and the ammonium chloride by the repeated-precipitation method of Schreib. He does not say how and where this process is carried out. But the advantage would be obvious. The ordinary Solvay process shares with the old sulphuric acid process the feature that expensive materials (ammonia and nitric acid respectively) are utilised for the purpose of preparing relatively cheap products (soda and sulphuric acid). If the ammonium can successfully be obtained as chloride, and if it should really answer as fertiliser, there would be a new important industrial application of synthetic ammonia, and the chlorine of sodium chloride and the lime would no longer be wasted as they are at present in many plants. Claude concludes that every ton of fixed nitrogen would yield as by-product three tons of soda (sodium carbonate). That may be a legitimate form of expressing the problem. Yet one must remember that ammonium chloride has first to be tried as fertiliser. For one thing, the commercial sal ammoniac is apt to turn hygroscopic and acid; even the pure salt is difficult to pulverise, and therefore not a convenient material for fertiliser dressing.—*Engineering.*

EMPLOYMENT OF CHEMISTS IN CHEMICAL WORKS.

THE following remarks of Dr. T. Lewis Bailey are quoted by the Chief Inspector of Alkali, etc., Works, in his annual report for 1918:

The more extended employment of chemists in chemical works generally is a hopeful sign, though one regrets that repeated attempts at persuasion in this direction in past years received comparatively little notice; it seems to have needed the upheaval of war to bring about a realisation of the disadvantages under which so many works were carried on in days gone by, when manufacturers either would not employ chemists at all or would only have such men as had been trained in the works themselves for the special purposes of those particular works. One has heard so frequently the excuse that a University-trained chemist is useless in works—in such cases it seems to have been assumed that a man taken direct from the University should have been able to drop immediately, and without trouble, into the intricacies of a works laboratory and of works processes generally. There have been, undoubtedly, faults on both sides—on that of the University and that of the manufacturer. It is not desirable that educational institutions should attempt to train chemists simply and solely on a technical basis; the student should surely be given first a good sound scientific training, with a sufficiency of laboratory work to make him a painstaking and accurate manipulator, irrespective of the time taken to arrive at his results; then, and then only, should he be taught to adapt himself to questions of time saving and shortened or rapid methods, coupled with the degree of accuracy desired for the end in view. He will then appreciate truly the evolution of technical methods necessary for the rapid control of the results of manufacturing operations.

But training on either the one or the other of these lines only is surely insufficient to produce the character required for a satisfactory and successful works chemist, who may be required to take his place in ever varying branches of the industry.

Further, when the manufacturer gets the product of this training, he still must not expect to have a man who can at once take his place under technical conditions, of which he cannot possibly know all the details; the manufacturer must now take up and complete the training and ascertain what is the adaptability of the man in question. Some quite naturally become leaders of men, and so can in a short time be led on from the laboratory to process and even works management, in which, be it remembered, thorough knowledge of scientific principles is a necessity for the development and extension of the processes of manufacture—there is no finality and there can be no standing still. Others, again, have little ability as men leaders, but they may be excellent investigators and as such particularly suitable in other departments of a works which aims at being progressive. Simple process testers there will always be, but these are quite apart from the guiding hands and have no effect on development.

May the near future see this all-important question take its proper place as one for serious consideration in all works where there is any pretension to permanency. In the immediate past the idea of progressiveness has been left too much to others; the attempt to stay where we were and work ever on old stereotyped lines has been well-nigh disastrous.

EXPLOSION OF CHLORATE OF SODA.

AN explosion of chlorate of soda caused, it is believed, by the heat of the sun's rays striking through the glass roof of a shed on to a number of steel drums containing the product, occurred shortly before noon on Tuesday at the dye works of Messrs. Naylor, Jennings and Co., Green Lane, Yeadon, near Leeds, and was responsible for a considerable amount of damage. About eleven of the firm's workpeople were gassed by chemical fumes and as many more were cut by falling glass from the shattered roofs and windows. One man, Alvin Smith, of Guiseley, was injured seriously enough to necessitate his removal to the Leeds Infirmary where he received attention. The Leeds Fire Brigade were summoned, and meanwhile the workmen—there are 360 men and women employed by the firm—fought the flames with their own appliances, and the fire was extinguished in about half an hour. Where the drums of chemicals had exploded a hole several feet in diameter had been blown in the stout stone wall of

the bleaching house. An additional danger during the short time the fire lasted arose from a number of carboys containing various acids. They were very close to the flames but fortunately no further explosion occurred. No estimate has been made of the damage but the repairs to the various roofs and walls and windows will cost many hundreds of pounds. The damage is covered by insurance.

EXPORT OF SULPHATE OF AMMONIA.

IN the course of his address at the half-yearly meeting of proprietors of the South Metropolitan Gas Company, held in London on Wednesday, Dr. Charles Carpenter, chairman, said that if temporary hardships due to pre-war sliding-scale were inevitable, and he thought they were, an extension of the hardships under which they were working by restricting their overseas chemical trade was surely unjustifiable. Of their by-products, other than coke, ammonia was, before the war, the most valuable, and they exported nearly all they produced. Some years before the war they were aware that Germany was producing in increasing quantities an artificial product of the highest quality, and they realised that to compete they would have to work up to an equally high standard. They had spent much time and money in achieving this, and looked forward to the cessation of hostilities to commence again their valuable export trade. But one of the many Governmental controls—necessary during the war, but so loath to take the opportunity peace provided of returning to their pre-war callings—declined to issue to the company an export licence unless they would join in a pool and do the business through its machinery.

But for the surprises of the war that would seem an incredible attitude to be adopted by a Department of the Government which certainly had no mandate to encourage trusts. He thought they were a very dangerous weapon for Government officials to play with, and that, whatever restrictions might be necessary as to imports, the sooner restrictions with regard to exports were removed from goods manufactured in Great Britain and not required by her inhabitants, the better it would be for her and her industries. The company's stock of chemical products stood at nearly a quarter of a million pounds. It would be much better realised, and in the country's coffers. He ought to add that dealings in other ammonia compounds than the particular one in which they were interested, though their basic value was the same, were entirely unrestricted.

DISPOSAL OF GLYCERINE STOCKS.

THE Imperial Government (writes a well-informed South African Correspondent of the *Morning Post*), were naturally left at the close of the war with a large stock of glycerine, the equivalent, I understand, of somewhere about 18,000 tons of crude, which they have handed over to the United Kingdom Glycerine Producers' Association to sell under commission *pari passu* with their own stocks. The Government have, of course, paid for the whole of their stocks. The result of this deal is to put many pounds sterling per ton into the pockets of the soapmakers, wholly at the expense of the users of glycerine; it is also understood the combine are endeavouring to rope in the French producers as well, so that they will have effectively cornered the glycerine market and be in a position to name their own price.

This is a grievance especially to the South African mining industry, to which cheap glycerine for the manufacture of dynamite is a vital necessity. During the war the Rand gold companies only received a standard fixed price for their gold. This price left many of them without a profit, and it is a tribute to their patriotism that they continued to produce without complaint. Several mines are now on the verge of closing down, owing to higher wages and the enormous increase in the cost of mining supplies. No doubt in some measure this is due to profiteering and high sea freights.

But now the Government, by creating a corner in glycerine, will make dynamite exorbitantly dear. They are, in fact, giving a glaring example of the very profiteering against which they are now introducing a Bill. And they are also striking a very serious blow at one of the most important of the producing industries of the Empire, at a time when increased production is vital.

PARLIAMENTARY NEWS.

Alcohol for Industrial Purposes.

In the House of Commons, Sir F. Hall asked the President of the Board of Trade whether he is aware that the present duty on spirit adds so heavily to the cost of certain manufactured articles, especially those in which it forms the basis of the manufacture, as to render it impossible for British manufacturers to compete with Germany, having regard to the relatively low cost of spirit in that country; and whether he will consider the advisability of modifying the duty in such cases, and to that extent enable the British home trade to compete with German imports?

Mr. Baldwin: Methylated spirit, which is free of duty when made in this country, is allowed in the manufacture of a large number of articles in which the use of spirit is required by British manufacturers. In addition, pure spirit is, under certain conditions, allowed to be used by them free of duty in arts or manufactures under the provisions of Section 8 of the Finance Act, 1902. As at present advised, I do not think that any alteration of the law is called for, but if the hon. member has any particular manufacture in mind, and will put before me the case, I will consider it. Where imported articles contain spirit they are, of course, charged on importation with the full spirit duty.

Chemists' Salaries.

Mr. R. Young asked the Parliamentary Secretary (1) whether he is aware that in November, 1918, a letter, signed by the chemists in His Majesty's factory, Gretna, and other explosive factories, was forwarded to the then Minister of Munitions, asking him to receive a deputation with regard to their claim for a revision of salary; whether he is also aware that the Superintendent expressed himself as being in sympathy with the claim of the chemists, and that no reply has ever been sent to the letter; whether he will have this matter inquired into and full consideration given to the question of salaries; (2) whether he is aware that a memorial signed by the chemists employed at Gretna and other explosive factories was forwarded to the Department of Explosives Supply; whether any reply was given by the Department to this memorial; whether he is aware that the memorial asked that a minimum salary of £350. be paid to chemists on the grounds that, for purposes of efficient factory control and the maintenance of discipline, the principle must be admitted that any official should be paid more than individuals for whose work he is responsible and whom he controls, and that a considerable percentage of the operatives and tradesmen employed are paid more than the chemists, while a very large number receive about the same amount; whether any consideration has been given to this memorial; and whether it is proposed to grant the claim?

The Parliamentary Secretary to the Ministry of Munitions (Mr. J. Hope): The question of the salaries paid in national factories to chemists and other technical officers had been under consideration before the memorial was addressed to the Minister of Munitions on November 16, 1918, by the chemists employed at Gretna and other explosive factories, and at about the same time a memorandum was received from the Institute of Chemistry of Great Britain and Ireland which covered the whole ground of the memorial. This letter was communicated to the Government Departments concerned, and finally led to the appointment of a Committee by the Treasury. This Committee is examining, in consultation with the Departments, the question of the salaries to be offered to scientific and technical officers whom it is desired to employ in the Government service. I sincerely regret that owing to pressure of work at the time of the armistice a reply was not sent to the memorial. I think it right, however, to add that the Explosives Supply Department of the Ministry of Munitions did much during the war to improve the status of chemists employed in industry; and even after making full allowance for the increased cost of living, the scale of salaries paid by the Department can be compared favourably with the salaries paid by private firms under pre-war conditions. At the present the number of chemists employed in the Explosives Department is thirty-five, and owing to the cessation of production this number is being rapidly reduced.

Gretna Green Munition Factory.

Mr. Kellaway, replying to Mr. Rose, said: The total capital expenditure on the building and equipment of the Gretna Green explosives factory was approximately £9,184,000. The

cost of working the factory from September, 1916, to the end of September, 1918, has been about £12,769,000. The staple product of the factory was cordite, though considerable quantities of intermediate products were supplied to other factories. Taking cordite alone, the value of the total production of the factory is estimated at about £15,000,000, on the basis of the average cost of the cordite supplied from home contractors' works during the same period. Prior to Gretna coming into production, this country had been dependent on the United States for a large part of its cordite. Had we bought from America the quantity of cordite produced at Gretna, the cost at the high price to America in 1916 would have been £23,600,000. As I have recently stated in reply to other questions, a report on the future use of the factory is at present under consideration.

Mr. Kellaway, replying to a further question on Monday, said the average number of persons employed at the factory between December, 1916, and September, 1918, was 18,117. The number employed at present was round about 3,000.

National Smelting Company, Limited.

Mr. Holmes, on Monday, asked the Parliamentary Secretary to the Ministry of Munitions whether the National Smelting Company, Ltd., has resumed building operations at Avonmouth; if so, what is the nature of the arrangement which the Government has entered into with that company, or with other parties, to induce such resumption as the result of consideration of the whole position and consultation with experts; and whether the Board of Trade proposes to carry out the recommendations of the Post-War Sulphuric Acid Committee, which recommendations were endorsed by the Government representatives serving thereon?

Mr. Bridgeman: I have been asked to answer this question. The arrangements made between the Government and the National Smelting Company in 1917 have not so far been modified in any respect. The whole question of the future of the spelter industry in this country is receiving very careful consideration, but my right hon. friend is not at present able to announce any decision on the matter.

Enemy Trade Marks.

Sir F. Hall asked the President of the Board of Trade whether, in a case where a British subject has purchased during the war from the Controller appointed by the Board of Trade under the Trading with the Enemy Act, 1916, all the machinery, material, stock in trade, and other movable assets of a German enemy business, but excluding goodwill and trade mark rights, and has by means of such purchase since carried on the business and manufactured and sold proprietary articles identified with the business, he is or will be liable to any proceedings on the part of the German proprietor of the goodwill and trade mark in respect of such manufacture and sale?

Sir A. Geddes: By Article 297 of the Treaty with Germany, every sale of or in connection with an enemy-owned business under exceptional war legislation is confirmed, and no claim or action can be brought in respect thereof by the previous proprietor. As regards any use of trade marks other than authorised by the Board of Trade under such legislation, the only protection afforded by the treaty is that given in Article 309.

British Oilfields.

Mr. Jameson asked the Chancellor of the Exchequer whether he is in a position to give an assurance that down to this date nothing has been done to commit the country to the policy of establishing a new system of royalties upon oil, and that nothing will be done in this direction during the recess?

Mr. Chamberlain: The answer is in the affirmative.

Mr. Bonar Law, in reply to Mr. Spoor, on Monday, said: Until the Government have come to a decision as to the ownership of petroleum in the British Isles, the purchasers of land and petroleum rights are warned not to assume that the ownership of petroleum is vested in the owner of the surface rights.

Imports and Exports.

Major Hayward asked the President of the Board of Trade whether, in deciding the question of restricting the import of any individual article, the effect of such restriction on trade as a whole is considered; and if so, what bodies are consulted to this end?

Mr. Bridgeman: The answer to the first part of the question is in the affirmative. The existing list of restrictions is due almost entirely to the recommendations of the Imports Consultative Council.

British Cellulose Company.

Colonel William Thorne, on Wednesday, asked the Prime Minister whether his attention had been drawn to the increasing number of complaints in the Press respecting the delay in presenting the report of the committee of inquiry into the British Cellulose Company; whether the Government were keeping the report back until after the summer vacation; whether he could state how it was this committee had been so long, seeing that the original inquiry only occupied 34 sittings; and whether, seeing that if the committee of inquiry found the original charges correct it might be necessary to take proceedings against some of the persons implicated, he could now give a definite date by which the report should be laid upon the table of the House.

Mr. Bonar Law said the reasons for the delay were contained in the report which was laid on the table on Tuesday, and would be circulated to members as soon as it was printed.

LEGAL INTELLIGENCE.**Schliemann's Oil and Ceresine Company, Ltd.**

The Official Receiver in the Companies Winding-up Division of the High Court has now issued his report under the liquidation of Schliemann's Oil and Ceresine Company, Ltd., of London House, 8, New London Street, E.C. 3, from which it appears that the statement of affairs shows as regards creditors gross liabilities amounting to £7,903. 9s. 6d. The assets consist of cash in hands of Controller £9,165. 9s. 10d. and a good book debt of £38. 0s. 3d., making the total assets amount to £9,203. 10s. 1d., and disclosing a surplus of £1,300. 0s. 7d.

With regard to contributories, the paid-up capital of the company is £500., so that there is an established surplus of £800. after payment of the company's debts and the shareholders' capital. The expenses of the Controllship have amounted to £480. 17s. 9d. (including the Controller's remuneration and law costs and other expenses), and £450. has been paid as compensation and other expenses), and £450. authorised by the Board of Trade.

The Winding-up Order was made on July 17, 1917, on a petition presented to the Court under Section 1 of the Trading with the Enemy Amendment Act of 1916, following upon a winding-up of the company's business by a controller appointed under the Provisions Act.

The assets have been realised by the Controller (with the exception of a small amount of book debts), and the amount £9,165. 9s. 10d. shown in the statement of affairs represented the balance in his hands at the date of the Winding-up Order. The book debts have been collected by the Official Receiver.

Bankruptcy Examination.

At the Leeds Bankruptcy Court on Tuesday, Ernest Erwin Ferdinand Heesch, lately residing at 158, Woodsley Road, Leeds, and formerly carrying on business at 212, Wellington Street as manufacturer's agent, now residing at 59, Clarendon Road, and carrying on business at the Stansfield Mill Yard, 77 and 79, Kirkstall Road, as oxy-acetylene welder and chemical manufacturer, under the style of "The Gatap Company," came up for his public examination. The debtor estimated his gross liabilities at £1,013. 19s. 6d., of which £924. 5s. 1d. is expected to rank for dividend, whilst the total available assets amounted to £155. 15s. 7d., leaving a deficiency of £768. 9d. 6d. Debtor attributed his failure to "bad trade and losses in the chemical business owing to faulty manufacture."

Answering Mr. Clifford Bowling (the Official Receiver), debtor said he was 50 years of age, and "a Dane by birth and a German by conquest." He came to England in 1891, and in 1896 commenced business as a manufacturer's agent, dealing mainly with textile machinery made in Germany. In October, 1915, he commenced business under the style of the "Gatap Company."

The examination was subsequently adjourned until October 7.

COPPER PRODUCTION IN THE UNITED STATES.—According to advance statistics giving the production of copper in the United States in 1918, the smelter production of primary copper was 1,908,533,595lb., compared with 1,886,120,721lb. in 1917. The production of new refined copper was 2,432,000,000lb., an increase of 4,000,000lb. over that of 1917. In addition to their output of metallic copper, the regular refining companies produced bluestone having a copper content of 7,917,696lb.

CHEMICAL STANDARDS.

WITH the sanction of the Council of the Institute of Chemistry, the Standards Committee convened a conference, which was held recently, to consider whether it is desirable to provide for the preparation and distribution of samples of pure chemical substances, ores, metals, etc., of ascertained composition, for use as standards in analytical work. The conference was attended by representatives of the Federal Council for Pure and Applied Chemistry, the Chemical Society, the Society of Public Analysts, the Society of Chemical Industry, and the Institute of Metals.

On the understanding that the provision of standard samples of steel and iron had already been taken in hand by the Iron and Steel Institute, in conjunction with the National Physical Laboratory, and that the Institute of Metals and the National Physical Laboratory have under consideration the same problem with regard to non-ferrous metals, the attention of the conference was directed mainly to the advisability of providing authoritative standard samples of other chemical substances and the steps to be taken to attain that object.

In the course of the discussion, the conference agreed to the following conclusions:—That the provision of standard chemical substances was desirable, for the general use of both chemists in practice and students: That, having regard to the fact that such standards could not be provided without reference to methods of analysis, the scheme should not aim at restricting the choice of methods, but always at their revision and improvement, thereby diminishing the chances of discrepancy in results. Incidentally, by this means, science will be advanced and accuracy more generally attained. That, in view of the importance of analysis in carrying out the scheme, the whole matter should be referred in the first place to the Society of Public Analysts, with the suggestion that the Society should form a special Committee, on which representatives of the allied Bodies should be co-opted; That the Society be asked to frame a scheme for the consideration of the Federal Council for Pure and Applied Chemistry, reporting on its practicability, the cost of the investigations involved, and the organisation generally; That ultimately the scheme be submitted to the Department of Scientific and Industrial Research, and, if necessary, the support of the Conjoint Board of Scientific Societies should be asked to secure the co-operation of the Government in its fulfilment; That, in the event of the Government placing the matter under official control, provision should be made for the co-operation in the scheme of the recognised Bodies concerned with chemistry and their respective members; That copies of this report be forwarded to the Federal Council for Pure and Applied Chemistry and the Councils of the Chemical Society, the Society of Chemical Industry, the Society of Public Analysts, and the Institute of Metals.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

AT any other time than the present the decline in coal production would have severely affected the by-product industry. Output this week is twenty per cent. below that of the pre-holiday period, and it has been a struggle to satisfy adequately the requirements of the district. The Irish market is, of course, hard hit, the cross-Channel shipments being down some 3,000 tons compared with those of a fortnight ago. If more blast furnaces were on ordinary iron the difficulty of keeping the 380 ovens supplied with sufficient coal to maintain them in full blast would be considerable. The prospect, however, of any increase in the make of ordinary iron, and, therefore, of local coke being needed is as remote as ever. It is true that the steel trade is still busily engaged on the shipbuilding side, but most of the West Cumberland hematite ordinary iron is smelted for the rail makers, and American competition has almost completely knocked the bottom out of the rail trade. What precisely the demand is for ordinary iron will be seen next week if, as is expected, the West Coast iron smelters this week-end decide to re-open the market. They long ago sold their output to the end of September, and are now ready to accept business for the last quarter of the year. There is little movement to be recorded in the by-products market. Benzole remains as heretofore in keen demand both in Ireland and locally; the make of sulphate of ammonia is absorbed without exporting; pitch and creosote are both moving away fairly freely; naphthalene is dull and there is no sale for pyridine.

ITEMS OF INTEREST.

KNIGHTHOOD.—The name of Mr. James Wallace Paton, head of the Matchless Metal Polish Co., Liverpool, appears in the list of Birthday Honours, published on Wednesday, a knighthood having been conferred upon him.

SULPHURIC ACID MANUFACTURE IN JAVA.—Recent investigations have shown that the mud of Lake Telga Bodas, Java, contains 80 per cent. of sulphur, and the Dutch Government propose to erect a plant for the manufacture of sulphuric acid.

JAPANESE MATCH EXPORTS.—The Japanese match trade with Bombay and Calcutta, two principal importers, is experiencing a revival from the dullness recently experienced, and shipments to China, Formosa, and Java are increasing.

OBITUARY.—Mr. John Midgley Nicholson, of the firm of Messrs. J. Nicholson and Sons, chemical manufacturers, of Hunslet, Leeds, has died suddenly in London from pneumonia. He was the only son of the late Mr. Joseph Nicholson, of "Wheatfield," Headingley, Leeds. At one time Mr. Nicholson held a commission in the West Riding R.F.A. (T.), and during the war he joined the Sportsmen's Battalion and served as a ranker. He is survived by a widow and one son.

NON-FERROUS MINING.—The President of the Board of Trade has appointed a Departmental Committee to investigate and report upon the present position and economic possibilities of non-ferrous mining in the United Kingdom and to make recommendations as to such Government action as may be expedient in regard thereto. The members of the Committee are:—Mr. H. B. Betterton, M.P., chairman, Mr. H. F. Collins, Mr. J. Harris, Dr. F. H. Hatch, Sir Lionel Phillips, Bart., Mr. R. A. Thomas, and Mr. James Wignall, M.P. Secretary, Mr. W. Palmer, Gwydyr House, Whitehall.

JAPANESE ZINC.—During the war the Japanese zinc industry was very prosperous and large profits were made on ore which was imported from Australia and the French Indies. The signing of the armistice, however, had dealt quite a blow to this industry, and it is reported that it costs £40. per ton to produce Japanese zinc, while the market price is only £37. per ton. It is expected that this will result in a request for subsidies and import protection, since the deposits of Japanese ore are of such inferior quality that competition with imported ore cannot be met successfully.—*U.S. Com. Rep.*

DRUG AND CHEMICAL WORKERS' CLAIM FOR HIGHER WAGES.—A mass meeting of the Amalgamated Society of Pharmacists, Drug, and Chemical Workers was held in London on Saturday, in connection with the agitation for higher wages and shorter hours in the drug and chemical industry. The Society alleges that some of its members are very badly paid, the average wage for men being 50s. to 55s. per week, and for women 25s. to 30s. It was announced that the drug and fine chemical manufacturers were ready to meet the Society, but it was decided to take no action until the result of the negotiations was known.

CANADIAN CHEMICAL TRADE.—Canada's foreign trade in chemicals has declined greatly since last year. According to the Federal report for the month of June the decline is marked in regard to both imports and exports, dutiable and free goods. The cessation of munitioning is believed responsible to a large degree. Chemicals and chemical products entered for home consumption in June, 1918, are as follows:—Free, \$2,182,631; dutiable, \$1,557,109. For June, 1919, the totals are:—Free \$730,282; dutiable, \$1,069,999. Exports for June of last year totalled, domestic, \$3,362,107, and foreign, \$21,395. June of this year, domestic, \$1,611,294, and foreign, \$1,382,647.

DUTCH IMPORTS OF FERTILISING MATERIALS.—No figures are available concerning the Dutch imports of potash from Germany during 1916, 1917, or 1918. The imports of potash, including kainite, muriate, and manure salts, were, however, 163,748 metric tons in 1914, and 121,933 metric tons in 1915. During the war Germany followed a policy of demanding Dutch agricultural produce in exchange for potash; and in 1917 and in 1918 the terms asked by the Germans were considered very harsh by the Dutch farmers. During the 1914-18 period the imports of rock phosphate for home consumption were in metric tons, as follows, according to official statistics: 1914, 134,032; 1915, 46,587; 1916, 64,667; 1917, 5,000; 1918, none. Official statistics of the imports of saltpetre for home consumption during the same period are, in metric tons, as follows: 1914, 72,800; 1915, 50,874; 1916, 69,625; 1917, 49,932; 1918, 26,662.

NON-FERROUS METAL STOCKS.—The following particulars are published of the stocks (exclusive of old metal and scrap) in this country in possession of the Minister of Munitions on August 1, 1919: Copper, 37,230 tons; spelter, G.O.B., 23,168 tons; spelter, refined, 12,136 tons; aluminium, 10,500 tons; soft pig lead, 108,010 tons; nickel, 2,452 tons; antimony regulus, 4,411 tons.

BUSINESS NOTICE.—The firm of Dawson and Emerson, chemical manufacturers, Longroyd Bridge, Huddersfield, has been amalgamated with that of J. C. Bottomley, Brookfoot Chemical Works, Brighouse, Yorks. A private limited company has been formed, and will trade under the name of J. C. Bottomley and Emerson, Ltd., the directors being Mr. J. Floyd Bottomley and Mr. Louis Emerson. Business will be carried on at the same addresses, and under the management as before.

ZINC AND ZINC DUST PRICES.—The market for zinc dust is still brisk, and £70. per ton is quoted for Australian high-grade brand (88-92 per cent metallic zinc), f.o.r. Further sales of a substantial character have been made, mainly parcels to arrive. There is no increase to report in the price of Australian electrolytic zinc (99.95 per cent. metallic zinc), the price of which remains at £42. per ton, f.o.b., Australia, for direct shipment to New Zealand, India, South Africa, and the Far East.

FATAL ACCIDENT AT SOAP WORKS.—A verdict of "Death by misadventure" was returned at an inquest at Widnes on Monday concerning the death of George Kay, who was employed at the soap works of Messrs. William Gossage and Sons, Ltd., Widnes. The deceased man was engaged with a travelling crane at the works, and on Friday of last week he stepped on to a plank which broke in the centre, and precipitated him on to the floor below. He died later in the day without recovering consciousness.

CHEMICAL MANUFACTURE IN CHINA.—Several factories have been erected in the province of Kwan-tung for the production of sulphuric acid, caustic soda, creosote, stearine, glycerine, and soap. The raw materials are obtained from Manchuria, but as these are available from other parts of China, it may be possible to develop the chemical industry throughout the country. Oils for the manufacture of soaps and ointments, seaweed for the production of iodine, ample raw material for calomel, caffeine, and pitch; as well as for alcohol, ammonia, various acids, etc., are all obtainable.

SWEDISH SHALE-OIL INDUSTRY.—The experts for the investigation of the possibility of the Swedish production of mineral oils from shale have made their report, which contains a number of interesting figures. They have calculated the size of the oil-bearing shale-strata and the oil-content, and have found that the whole supply of oil-shales in the South of Sweden corresponds to 144 million tons of crude oil. Sweden's resources in oil-shale are by themselves sufficient to satisfy for a long time to come the country's requirements of oil, which are estimated at 150 million kg. per annum. In the present state of prices the costs of mining the shale are estimated at about 2.30 kr. per ton if about 50,000-100,000 tons are mined a year. Consequently the mining will be very highly dependent on the question of prices; but the experts are of the opinion that the inquiry they have made shows that, despite the very high prices during the war, a shale-oil industry would have been a very profitable undertaking. The necessity of a State subsidy for the industry in question is emphasised.

WELFARE ARRANGEMENTS IN OIL-CAKE MILLS.—The Home Secretary has made an order, under the Police, Factories, etc. (Miscellaneous Provisions) Act, that in all factories in which the manufacture of oil-cake is carried on the occupier shall provide and maintain for the use of all persons employed suitable protective clothing, accommodation for clothing put off during working hours, with equipment for drying it if wet. Adequate messrooms, warmed during meal-times, must be provided, together with washing facilities, including a supply of clean towels, soap, and warm water. Shower baths must be fitted, if one-half of the employees so desire, in the proportion of one bath to every fifty employees. A sufficient number of boxes or cupboards, containing specified first-aid requisites, must be installed, and if the number of employees exceeds 500 the occupier must provide and maintain in good order an ambulance room under the charge of a qualified nurse or other person trained in the rendering of first aid, who shall be readily available during working hours. The order comes into force on September 1.

CELLULOSE INQUIRY.—Lord Sumner's report on the Cellulose Inquiry was laid on the table of the House of Commons on Tuesday night, and will be published immediately.

MALAY STATES TIN EXPORTS.—It is reported officially from Kuala Lumpur that the July exports of tin from the Federated Malay States amounted to 3,756 tons, as compared with 2,873 tons in June and 3,373 tons in the corresponding month of last year. For seven months of the present year the export amounted to 22,145 tons, against 21,911 tons in 1918, and 23,005 tons in 1917.

CHEMISTS IN WAR.—The Chairman of the Proceedings Committee of the Institute of Chemistry has been requested to investigate the possibility of preparing an account of the services of British chemists during the war. The General Purposes Committee have had before them a schedule of possible contents of a book on the subject, and preliminary arrangements have been made with Messrs. Constable and Co. to act as the publishers for the Institute. All chemists who are in a position to assist in this matter are invited to communicate with the Registrar.

OIL PRICES FIXED.—The Ministry of Food (Oils and Fats branch) have issued an Order fixing the following prices for deodorised oils, to be paid by margarine makers or other licensed consumers, net, naked, ex mill: Deodorised palm-kernel oil, spot November delivery £110., December £104., January £102., February £100.; deodorised ground-nut oil, spot September delivery £130., October-December £120., January £110.; deodorised soya-bean oil, spot December delivery £110.; and deodorised coconut oil, spot and forward delivery £110. Brokers' commissions, etc., if any, to be borne by the sellers.

DETECTION OF OXIDISED SULPHUR COMPOUNDS.—An extension of the use of mercuric chloride as a reagent for the detection of thiosulphates and other oxidised sulphur compounds is described by A. Sander (*Chem. Zeit.*) When this reagent is added to a solution of sodium sulphate the solution remains neutral and no precipitate forms. In the cold sulphite solutions give no precipitate, and remain alkaline to methyl orange as before the addition of the reagent, but on heating mercurous chloride separates and sulphur dioxide is liberated. Bisulphite solutions behave similarly, except that they become strongly acid even before heating, as hydrogen chloride is one of the products of the first reaction in the cold. If sulphides are present, a black precipitate of mercuric sulphide forms at first, but on the addition of excess of mercuric chloride this is transformed into the yellowish-white double salt $2\text{HgS} \cdot \text{HgCl}_2$. Excess of mercuric chloride is always added, as the further examination of the supernatant liquor is then simplified. Thiosulphates behave like sulphides except that in the case of thiosulphates the solution becomes strongly acid. Polythionates behave like thiosulphates, from which they can be distinguished by the fact that they do not reduce iodine.—*Analyst*.

SPANISH OLIVE OIL.—H.M. Commercial Secretary at Madrid reports that the *Official Gazette* of July 6 contains five Royal Orders affecting trade in olive oil. At the end of June the Spanish Press was almost unanimous in announcing that the Government had decided to permit the free exportation of olive oil. The announcements were so positive that the Minister of Supplies found it necessary to publish a statement to the effect that these rumours were entirely false, and, as a matter of fact, the actual circumstances were leading him to take precisely the opposite course. He added that he had no intention of authorising any exportation beyond the quantities fixed by the Royal Order of January 13, 1919. Order No. 120 deals with the question of the price of olive oil. Order No. 121 announces that licences which have not been taken advantage of within sixty days will not be extended for more than half that period. The deposits made in accordance with the permission to export 90,000 tons will remain at the disposal of the Ministry until December 31 of this year, after which, if they have not been distributed for national consumption, they will be cancelled, unless extraordinary circumstances arise. Persons to whom the oil in the deposits has been awarded to be sold at the legal price must remove it within thirty days. Order No. 122 fixes prices at which soap made from olive waste may be sold. Royal Order No. 123 provides for manufacturers to declare their present stocks. Royal Order No. 124 provides that no further applications for exportation of olive oil will be considered; that applications already received should be granted in the order of their dates, until the 90,000 tons have been exported.

DERBYSHIRE LEAD MINES CLOSED.—Owing to the strike, the proprietors of the Mill Close Lead Mines, Derbyshire, on Saturday closed down the whole of the works excepting the pumping machinery.

CHEMICAL SOCIETY.—The Chemical Society has applied for the grant of a Supplemental Charter. All petitions for or against the grant of the Charter should be delivered at the Privy Council Office not later than August 30.

ARSENIC IN THE UNITED STATES.—Advices from the United States place the production of arsenic in that country during 1918 at about 6,400 tons, which was contributed by four companies. This would show an excess against the previous year of 10 per cent. The imports for 1918 were about 5,600 tons, two-thirds of which came from Mexico and the remainder from Canada, apart from small parcels from England and Australia. Including the imports, the total supplies available for American consumption thus amounted to, roughly, 12,000 tons, while it is estimated that this total was practically equal to actual needs.

NEWCASTLE CHAMBER OF COMMERCE AND THE PATENTS BILL.—Mr. Charles Turnbull, electrical engineer for the borough of Tynemouth, at the Newcastle Chamber of Commerce last week, proposed the formation of a special committee to consider the Patents and Designs Bill. He said it appeared to be the intention of the Bill to wipe out British inventors, and under the present state of affairs he was bound to admit that he would advise a young man with ideas to keep them in his head, or go to America, where they would be developed. When the war broke out, Sir Albert Stanley went to inventors and told them they would have to cease working their inventions and get on with war work. The inventors agreed, and asked that in fairness they should be excused paying on patents during the war. Sir Albert Stanley said if they did not pay, their inventions would lapse. They asked for an extension of the patents after the war, and that was also refused. The new Bill would be even more oppressive to British inventors. America had a name for inventive genius, not because Americans were cleverer than Britishers, but because any man could get a patent for 17 years at £7, but in England he would have to pay £100 for only 14 years, and this country lost by the number of ideas which men who had suffered by the British patent law refused to develop. A small technical committee was appointed to report to the Chamber on the Bill.

RUSSIAN SALT.—Russia is possessed of extensive deposits of mineral salt. The salt beds are heavy, and in many places they are remarkably pure. Lake salt is also plentiful in many districts. The distribution of salt in Russia is very wide, and in some places the deposits are practically continuous over immense areas. There are salt deposits in southern Russia, hitherto the most fully exploited of any in the country, particularly at Bakhmut and Slavyansk. Rock salt is obtained at Bakhmut and lake salt at Slavyansk. Large quantities of salt produced here are extensively used in the various industries of Russia. To some extent the south Russian salt is exported and shipped from the southern ports on the Black Sea to other Russian ports on the Baltic. In the Urals there is a salt deposit called Iletz Zashchita, which is claimed by some Russian authorities to be not only the purest salt in the world but the most extensive bed. It is of large grain, crystalline, white, with a gray tinge, and its yield of chloride of sodium on analysis is declared to be 99 per cent. For the production of soda and other chemicals and for use in other industries there is sufficient salt in Russia to maintain a growing soda industry at home and to supply all other reasonable wants for a long time ahead. Baskuntchak Lake is another salt reserve of immense extent. The lake is shallow, and the salt is easily obtained from it. The salt recovered by natural evaporation in the summer time contains 98 per cent. of chloride of sodium. Rock salt is found at a depth of 42 feet, and a third grade after passing through clay of undetermined thickness. About 540,000 tons of salt are raised from this area annually, and the production increases steadily. A statement made some years ago shows salt exists in the Privilinsk and Baltic regions; in South Russia, particularly at Slavyansk and Bakhmut; farther south in the Crimea; in Astrakhan in the form of lake salt; in Perm, where it is obtained by evaporation; in Siberia, at Kurgan, Nikolaevsk, and Omsk. The known deposits of salt in eastern Siberia are of enormous extent. The most notable ones known are found on the River Vilyui, a tributary of Lena River. The known salt of the Caucasus and other regions is not yet sufficiently developed to be of much importance.—*U.S. Com. Rep.*

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Nitrate of Soda.—Last month's shipments from Chili are officially announced as having been 6,990 tons to Europe, 7,990 tons to the United States and 5,400 tons to other parts, together 20,380 tons against 300,300 tons in July last year. It will be seen that the export business was still practically in abeyance, but as about 34,000 tons were loading on the 1st inst., the August figures will, as we expected, show some increase on those of the last few months. The July production of nitrate of soda having been 115,120 tons the stock on the West Coast rose to the unprecedented total of 1,600,650 tons, comparing with 817,000 tons on August 1, 1914, just before the beginning of the war. The statistical position is thus entirely abnormal, and it can right itself gradually only when the supply of tonnage for exports becomes more plentiful some months hence; the accumulation of stocks will indeed continue unless more oficinas close down. Transactions in Chili are confined to a few second-hand parcels and sales for account of the German works now about to resume operations, and, as stated in our last issue, at prices considerably below those "fixed" by the Nitrate Producers' Association. Endeavours are being made by the Government to complete the "combine" by bringing in the outsiders, who having made large forward sales will no doubt now be glad enough to join the *convenio*. After "squeezing" the Allies for several years, nitrate producers have, in order to recoup the falling-off in quantity, put up the price of the by-product iodine to one shilling per ounce. As the cost of the drug is under two-pence per ounce laid down in Europe, the profit made out of the treatment of the wounded in the war may readily be imagined. The nitrate business is not run on philanthropic lines.

A New French Fertiliser Concern.—The Société Generale des Mines d'Algerie-Tunisie (Omnium) is taking a direct interest in a new company that has just been formed in France with a capital of 12,500,000 francs embracing the Société pour l'Industrie Chimique en France and the Société des Produits Chimiques de Paimbœuf. The Omnium will be the directing agency of this new concern, the capital of which it is understood may be made up to 40,000,000 francs, the initial capital being 12,500,000 francs. The board will include M. Henry de Peyerimhoff de Fontenelle, who is president of the Spanish Phosphate Union of Constantine, etc. The name of the new concern is the Union Française de Fabriques d'Engrais, de Produits Chimiques, et de Superphosphates. The factories involved are at the port of La Palisse.

Italian Note.—On the Italian market there is nothing of note to be recorded. Prices remain practically as last reported. The Government are well aware of the need for fertilisers, particularly in Northern Italy, on the beetroot fields and such like. The measures already referred to as being urged on the Government for assuring the land cultivators of the necessary supplies have received what may be called fair attention, and as far as resources available can be directed into their proper channels by Government aid it may be expected that those who need the fertilisers will be duly provided. But tonnage remains the question.

Sulphate of Ammonia.—This material is in good demand just now at the price of £19. 10s. The amount that is being produced at present is not so large as was expected and it is feared that the export trade will be the sufferer. New prices are to be fixed after the end of September and it is rumoured that these will be at an advanced level, one suggestion being a minimum of £20. per ton. From across the Atlantic the news comes that despite the fact that there is a large production of sulphate of ammonia in the United States, there is apparently sufficient business arranged to prevent any special accumulation of stocks that would materially affect the market so far as price changes are concerned. Demand for export from the States is said to have eased off somewhat, but people interested in this line are declaring that they look forward confidently to an improvement in the volume of export business.

Basic Slag and Superphosphate.—The demand for basic slag continues to be brisk and the average of trade appears to be more than is usual at this season. A good many works are as full of orders as they can be for August delivery. An especially good sale of 30 per cent. basic slag is reported. The present prices of superphosphate are for delivery this

month only, and from September onwards advanced prices are to be fixed. Farmers are therefore giving extensive orders for August delivery. If payment is now made the lower price will rule. The French superphosphate market is concerned about the slowness of arrivals of phosphate from Algeria. The reason is lack of tonnage.

Potash.—Movements in this material are quieter, and in some cases lower prices are reported. Interest is once more being directed towards the American potash situation. There the domestic potash industry has been an outgrowth of the war. The capital invested in the industry is estimated at about £5,000,000., a considerable part of which is represented by expenditure for experimental purposes and for the determination of technical methods and plant construction. The actual output of all the American plants at the end of last year was about 55,000 tons, but the estimated capacity was double that. Even the latter figure, however, is hardly expected to be sufficient for the home demand, which is figured out at quite 200,000 tons. The regions of the greatest potash output in America are in the Far West, and they are handicapped in competition with foreign potash by their remoteness from the market and especially from the Eastern potato and kitchen stuff regions and the Southern cotton districts.

Bones, Bone Meals, Etc.—A good trade is reported to be passing in dissolved bone compound at from £7. 17s. 6d. to £8. 5s. per ton. Pure steamed bone flour at £11. to £13. also moves off easily where available. The price for East Indian remains at about £15. 10s. at Liverpool. Generally supplies are short and complaints are again being raised with regard to the hindrances in the way of transporting this much-needed material to this country.

Other Fertilisers.—In miscellaneous fertilisers trade is quiet, but there is reported to have been some active business in good quality fish guano, 9 per cent. ammonia and 14 per cent. phosphate, which has been traded in at £18. per ton.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

There is much briskness in the tinplate mills and all factories are now again operating after the usual stoppages for repairs. It is thought among the manufacturers that they will be unable to keep up with the American competition if prices of fuel and steel are to remain for any length of time at the present high levels. During the last few days over 5,000 boxes from the United States have been discharged at Liverpool and the price delivered at this port is 31/- per box or about 3/- less than the Welsh makers' quotations. Effective measures in the way of alteration of machinery will have to be made if the local manufacturers are to compete. The exports for the week fell by 50,000 boxes compared with the previous week and stocks at docks have increased by 38,000 boxes.

A Brazilian delegation has been visiting Swansea this week, Dr. Pandia-Calogeras being at its head. The object of the visit is to devise some means of enlarging business relations between the two countries and the Swansea Chamber of Commerce have lost no opportunity of expressing their opinions upon the matter. The delegates were entertained by the Mayor and also by Mr. F. W. Gilbertson, chairman of the Swansea Metal Exchange, and during their three days' stay they visited the works of Messrs. Vivian and Sons, the English Crown Spelter Works, the tin and chemical works of Messrs. Gilbertson at Pontardawe, and the Cwmfelin Tin Works.

The Cardiganshire bog fields are being developed for peat to use as fuel. There are said to be 15,000 acres of good peat that can be exploited at a profit.

The National Oil Refineries are to erect four oil tanks at the King's Docks, Swansea, with a total storage capacity of 28,000 gallons.

The patent fuel trade continues active and the call for briquettes is increasing. Cardiff makers sent cargoes to St. Malo, Lannion and Cherbourg. The Swansea shipments were for Dieppe, Barcelona, Nantes and St. Brieux. The Port Talbot exports were above the average, and included 4,169 tons to Sfax, 3,160 tons to Dakar, and 2,497 tons to Rouen. Binding materials are much more difficult to obtain and prices have increased.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS.

THE following returns, which are taken from the import statistics of the United Kingdom, give the amount and value of chemicals and allied products imported during the month ending July 31, 1919, as compared with July, 1918.

NEW COMPANIES.

British Window Glass Company, Ltd.—Capital £450,000., in 100,000 preference shares of £1 each and 1,000,000 ordinary shares of 1s. each. Solicitors: Johnson, Weatherell and Co., 7 King's Bench Walk, Temple, E.C.

Paripan, Ltd.—Capital £100,000., £1. shares. Objects: To acquire all or part of the business of Randall Bros. and the Copal Varnish Company, Ltd., including the trade mark "Paripan," and to carry on the business of importers, exporters, and manufacturers of and dealers in oils, colours, varnish, ship and other compositions, etc. Registered office: Sherwood House, Piccadilly.

Ajax Aniline Dye Manufacturing Company, Limited.—Private company. Capital £50,000., £1. shares (47,000 preference and 3,000 ordinary). Agreement between F. Young and E. A. Gedge of the first part, Pronk, Davis and Rushby, Ltd., of the 2nd part, and this company of the third part. Registered office: 119-120, London Wall, E.C.

Eastern Counties Bone Products Company, Ltd.—Private company. Capital £20,000., £1. shares. Registered office: Daxford Works, Daxford, Cambs.

G. A. Shankland, Ltd.—Private company. Capital £40,000., in 39,000 ordinary shares of £1. and 20,000 deferred ordinary shares of 1s. each. Chemical manufacturers and merchants, engineers, warehousemen, etc. Registered office: River Mills, Eynsham, Oxon.

G. F. Thew, Ltd.—Private company. Capital £20,000., £1. shares (3,000 deferred). Object: To take over the business of an ironmonger, hardware merchant, varnish manufacturer, and dealer in oils and gums carried on by him at 158, London Road and 84, Christian Street, Liverpool. Solicitor: R. T. Smith, 6, Newington, Liverpool.

North of England Chemical Works, Ltd.—Private company. Capital £25,000., £1. shares. Agreement with J. F. R. Wilson of the one part and A. Darling of the other part for the purpose of acquiring the business carried on at Spittal, Berwick-on-Tweed, as the "North of England Chemical Works." Office: North of England Chemical Works, Sandsell Road, Spittal, Berwick-on-Tweed.

Rigby Taylor, Ltd.—Private company. Capital £15,000., £1. shares. Dealers in bleaching, dyeing and sizing materials, disinfectants, soaps, chemicals, drugs, colours, glues and paints, drysalts, etc. Registered office: Victoria Works, Garside Street, Bolton.

Slag Products, Ltd.—Private company. Capital £10,500., in 10,000 ordinary shares of £1. each and 10,000 founders' shares of 1s. each. Object: To acquire the world's patent rights in an invention for the moulding of slag for building or engineering purposes, and in a secret process for the manufacture of Portland cement. Registered office: 6, Lloyd's Avenue, E.C. 3.

GERMAN COMPETITION IN DYES.

THE conviction in many well-informed circles at the time of the signing of the armistice that the dyestuff market in the United States would remain firm for a period of at least a year, and that German competition could not be feared for a period twice as long, if at all, according to a statement issued by the U.S. Bureau of Commerce, has been so far well founded. This conviction was based in a large degree on the opinion that the transition of the industry from a war to a peace footing, involving the utilisation of vast quantities of materials formerly used in the manufacture of explosives, would be so gradual as hardly to affect the cost of manufacture at all. Moreover, the factor of possible German competition seemed slight when the actual conditions in the German industry were taken into consideration. Even granting a huge accumulated stock of dyestuffs prepared during the war, the dimensions of which have gradually dwindled under closer scrutiny, Germany is in no position to flood the world's markets. The demand in near-by and domestic markets is likely to take care of a great deal of the stocks on hand, and even though Germany withheld these stocks from these markets hoping to dump them abroad as soon as production was re-established, the sacrifice would be greater than the reward. Germany's labour costs, taxes, and overhead charges from restricted production will all be higher than in other countries, and these factors will work adversely to German domination of the world's dye markets to anything like the extent enjoyed before the war.

REPORTS OF COMPANIES.

British Glass Industries, Ltd.

An extraordinary general meeting was held in London on Thursday, August 7, for the purpose of increasing the capital of the company.

Mr. C. Williamson Milne, who presided in the absence, through indisposition, of the chairman (Mr. Clarence C. Hatry), said that new capital, in addition to provision for further working capital, was being raised for the purpose of acquiring some extremely valuable interests. The company had secured the whole of the shares of the Queenborough Glass Bottle Works, Ltd., and the business of the British and Foreign Bottle Company, both of which companies had had a most successful career, and had earned very large profits. The earnings from those companies alone at the present time, and under present conditions, would, if fully distributed, be sufficient to provide a substantial dividend on the present share capital of British Glass Industries, Ltd., and it was confidently expected that with the installation of latest automatic machines, which had been ordered for the Queenborough works, those profits would be considerably increased in the future. In addition to those two businesses, the directors had acquired 300,000 8 per cent. cumulative participating preference shares of £1. each in the British Window Glass Company, Ltd. The Chairman formally moved: "That the capital of the company be increased to £600,000, by the creation of 300,000 additional shares of £1. each, ranking for dividend and in all other respects *pari passu* with the existing shares of the company."

Sir Ernest Clark seconded the motion, which was carried unanimously.

DIVIDENDS.

ARIZONA COPPER COMPANY, LTD.—A dividend for the half-year of 9d. per share. The directors, in explaining the reduction of the dividend from 1s. 6d., state that when the war ceased large stocks of copper produced at a high cost were on hand and a situation created which rendered inevitable difficult conditions for some time to come.

PRICE'S PATENT CANDLE COMPANY, LTD.—An interim dividend of 15s. per share for the half-year ended June 30 and a bonus of 5s. per share, less tax.

UNITED TURKEY RED COMPANY, LTD.—An interim dividend for the half-year to June 30 last at the rate of 5½ per cent. per annum on the ordinary shares, free of tax.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W. 1, whence further information may be obtained:—

Belgium.

H.M. Vice-Consul at Liège writes that the following goods are in demand in Belgium:—Sulphuric acid, sulphate of soda, calcium chloride, aniline dyes, and china clay.

An agent at Charleroi desires to obtain an agency for United Kingdom paint and varnish manufacturers. (Reference No. 335.)

France.

A firm in Bordeaux wish to represent United Kingdom soap manufacturers in that district. (Reference No. 339.)

Poland.

An agent in Warsaw wishes to get into touch with United Kingdom manufacturers of chemicals who are desirous of appointing an agent for Poland. (Reference No. 342.)

Russia.

A wholesale commission agent, with an office at Petrograd, which is temporarily closed, intends to open branch offices at Moscow, Kharkoff, and other large cities in Russia when conditions permit, and desires to secure agencies for United Kingdom manufacturers of special machinery for oil mills, soap factories, chemical works, etc. (Reference No. 345.)

United States.

A firm of import and export merchants in San Francisco wish to communicate with United Kingdom exporters of oils, rubber, chemicals, metals, and ores. (Reference No. 356.)

Chili.

A firm in Santiago de Chili are desirous of acting as agents for manufacturers of dyes and chemical products. (Reference No. 357.)

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

The specifications of the following applications are not printed by the Patent Office until the complete specifications have been accepted.

July 26th to August 2nd (inclusive).

- Recovery of Fats from Waste Liquids. Blunn, J. 18,982.
 Process for Extraction of Metals from Minerals or Solutions or for Separation or Refinement of Metals. Browning, W. J. 19,028.
 Treating Air or Gases with Liquids, or vice versa. Bulgin, W. J.; Hall, E. A.; and Searle, G. 18,742.
 Coagulating Latex. Burney, T. (Westwood). 18,906.
 Treating Carbonaceous Material for Recovery of Volatile Hydrocarbon Constituents. Bussey, C. C. 18,837.
 Manufacture of Gold-coloured Sulphurs and Vermillions of Antimony. Chailaux, P. 19,085.
 Isolation of Hyocynamine. Chemical Works, formerly Sandoz. 18,686.
 Evaporators. Couche, C. W. 18,949.
 Purification of Nitro-cellulose. Duciaux, J. 19,165.
 Manufacture of Nitric Acid. Henwood, A. 18,847.
 Recovery or Separation of Metals. Hibbert, A.; and Nüranen, W. J. 19,015.
 Non-inflammable and Waterproof Paint. Hutchison, A. 18,726.
 Condensation of Phenolic Bodies with Aldehydic Compounds. Ioco Proofing Company; Nuttall, W. H.; and Vickers, Ltd. 18,827.
 Helical Extrusion Apparatus for Manufacture or for Treating Fatty Substances. Jackson, J. G. 18,977.
 Evaporators. Jackson, W. J. Mellersh. (Criscom-Russell Co.). 18,718.
 Retorts. Low Temperature Carbonisation, Ltd.; and Armstrong, H. L. 18,917.
 Production of Hydrogen Sulphide from Sulphurous Gases. Macleod, J. G. (Browning). 19,027.
 Solutions of Nitrate of Calcium of High Percentage. Nitrum Akt.-Ges. 18,681.
 Vulcanising Dissolved Caoutchouc. Penchev, S. J. 19,132.
 Artificial Resin and Intermediate Products. Resan-Kunstharz-Erzeugungs-Ges. 18,789.
 Catalytic Heating-apparatus. Soc. Lyonnaise de Rechauds Catalytiques Camell, Cochet, Gritte, et Cie. 18,936.
 Subliming Chemical Elements or Compounds. Whitfield, C. 18,854.

August 5th to 9th (inclusive).

- Instantaneously-drying Ink. Airne, C. W. 19,198.
 Agglutinant for Conglomeration of Coal. Ayestarán é Irazusta, L. 19,477.
 Reclaiming Rubber. Benner, W. W.; and Young, J. 19,380.
 Fractional Distillation. Chenuard, E. A. R. 19,318.
 Manufacture of Artificial Silk. Clayton, J. 19,297 and 19,298.
 Drums for Sherardising. Coles, S. O. Cowper-. 19,426.
 Building Up or Growing Iron upon Steel, etc. Coles, S. O. Cowper-. 19,427.
 Electro-deposition of Iron Alloy. Coles, S. O. Cowper-. 19,428.
 Manufacture of Iron Tubes by Electro-deposition. Coles, S. O. Cowper-. 19,429.
 Electro-deposition of Iron. Coles, S. O. Cowper-. 19,430.
 Recovery of Iron from Scrap Tinned Steel. Coles, S. O. Cowper-. 19,431.
 Recovery of Tin. Collins, J. J. 19,585.
 Reducing Solid Fats to Liquid. Damin, J. B. 19,246.
 Extracting Oil from Shale, Coal, etc. Edwards, H. 19,650.
 Manufacture of Alcohol. Elektrizitätswerk Lanza. 19,573.
 Continuous Still for Evaporation or Distillation and Fractionation of Liquids. Gulliver, G. W. 19,543.
 Recovery of Nitrate of Soda from Solutions. Hobshawm, I. B. (Gripioni, partly). 19,391.
 Aromatic Arylsulphonyl and Arylenedisulphonyl Derivatives of 1:4-naphthylenediamine and Its Sulphonic Acids. Imperial Trust for the Encouragement of Scientific and Industrial Research; and Morgan, G. T. 19,392.
 Concentrated Solutions. Junquera, B. 19,639.
 Petroleum Reduction. Kormann, F. A. 19,421.
 Material for Manufacture of Electrodes. Olsen, O. R. 19,383.
 Wool-scouring, etc., Preparations. Plowman, W. W.; and Rose, D. G. Cameron-. 19,606.
 Indicating at a Distance Level of Liquid in a Tank. Ratti, G. 19,295 and 19,508.
 Electrodes. Read, F. W. 19,567.
 Purification of Petroleum, etc. Richardson, J. C. 19,238.
 Treatment of Coal to Obtain Bituminous Constituents. Rütgerswerke Akt.-Ges. 19,574.
 Solidifying Oleaginous Substances. Seobel, B. 19,286.
 Transforming Alkaline Monochromates into Bichromates or Chromic Acid. Soc. Industrielle de Produits Chimiques. 19,388.
 Gas-analysing Apparatus. Svenska Aktieförbundet. Mono. 19,518.
 Manufacture of Basic Sulphate of Zirconium. Wale, H. (Pennsylvania Salt Manufacturing Co.). 19,601.
 Tar Extractors and Scrubbers for Gas. Wells, J. 19,478.
 Ammonium Sulphate. Wynne J. S. 19,282.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C.

1913.

- Reducing Agents. Goldstein. 29,628.

1917.

- Acetyl Cellulose. Stevenson, W. J. 19,049. 130,029

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Lamp-black. E. L. Curbishley, Chendale Hulme, Cheshire. British Patent, 127,770, of 1918.

Lamp-black is rendered dustless by mixing with water to form a paste, adding 2.5 per cent. of resin oil, and then heating to drive off the water.

Treatment of Fatty Oils. W. H. Huxley, Liverpool. British Patent, 128,007, of 1918.

Castor oil is made blendable with mineral oil by the successive operations of treatment with strong sulphuric acid in the cold, agitation, settling, mixing with hot water, passage of an electric current between zinc plates immersed in the oil, and separation of the oil from the zinc sulphate solution produced. Mixtures of the treated oil and suitable mineral oils are used as lubricants for machinery.

Azides. W. R. Hodgkinson, Woolwich. British Patent, 128,014, of 1918.

Salts of hydrazine are diazotised by means of a suitable nitrate, without the use of ethyl benzoate or the like, the reaction mass being kept on the border line between acidity and alkalinity. For example, hydrazine sulphate is treated with sodium nitrate; the sodium azide produced, without being separated, may be caused to react with silver nitrate for the production of silver azide. When lead azide is to be prepared, hydrazine nitrate may be used in place of the sulphate.

Concentrating Brine. Salt Union, Ltd., and G. W. Malcolm, Winsford, Cheshire. British Patent, 127,954, of 1918.

Brine is evaporated in a pan A of triangular cross-section having at its bottom a screw conveyor B which carries the deposited crystals to an elevator C. The pan is heated by furnace gases passing along flues G, H at the sides of the pan separated by partitions I. The gases pass first along the upper flue G, so that the upper parts of the sides of the pan are more strongly heated than the lower. The partitions I preferably stop some way short of that end of the pan at which the elevator C is situated.

Amines. W. Rintoul, J. Thomas, and Nobel's Explosives Company, Stevenston, Ayrshire. British Patent, 127,740, of 1918.

Tertiary amines are separated from admixed primary or secondary amines by treating the mixture with ethylchloroformate to convert the primary or secondary amines into urethanes; the unattached tertiary base is removed from the product by washing with dilute acid, and recovered from the acid solution by treatment with alkali; the separated urethane is hydrolysed to give the primary or secondary amine. An example is given of the treatment of crude dimethylaniline containing monomethylaniline.

Recovering Cyanogen Compounds and Sulphur. W. Anderson, Helensburgh, Dumbartonshire. British Patent, 127,128, of 1918.

The spent oxide which has been used for the purification of coal-gas is treated with solvents in centrifugal apparatus for the recovery of cyanogen compounds, such as sulphocyanides and ferrocyanides, and of sulphur. Steam, for example, exhausted from the steam turbine used in driving the centrifugal apparatus can be passed in first when the soluble sulphocyanides are dissolved in the condensed water. Bisulphide of carbon, with or without benzole, is then admitted, preferably as vapour along with steam, to remove sulphur. The ferrocyanides are recovered by treatment with ammonia, and the ammonium salt may be treated afterwards with alkali for the production of alkaline ferrocyanides.

Hydrogen. H. J. Prins, Zaandam, Holland. British Patent, 128,273, of 1917.

In preparing hydrogen by the action of water or water vapour upon carbon or carbon-containing substances at a high temperature (300-600° C.) in the presence of a catalyst, which causes the simultaneous formation of carbon dioxide and not of carbon monoxide, a suitable catalyst consists of a mixture of one or more substances from each of the following classes: (1) Oxygen-containing inorganic salts of alkalis or alkaline earths, or compounds from which such salts may be formed in the process, such as the oxides or hydroxides, which may absorb carbon dioxide, and (2) inorganic oxides or hydroxides which may act as acids, such as oxides of boron, aluminium, silicon, tin, titanium, zirconium, tungsten, molybdenum, vanadium, and rare earth metals, or compounds from which such oxides or hydroxides may be formed in the

process, such as aluminium or other carbide, or salts such as aluminium or tin chlorides which are hydrolysed by the water vapour, or salts such as sulphates which are hydrolysed after reduction by the carbon. In addition, oxides of iron, chromium, or manganese may be added. In an example, coke, sand, and phosphate of lime are mixed intimately and heated to 400-500° C., and then steam is passed over. The gas is washed with soda-lye to remove carbon dioxide.

Catalytic Production of Nitrogen Oxides. E. B. Maxted and T. A. Smith, Walsall, Staffordshire. British Patent, 127,845, of 1917.

The catalytic oxidation of ammonia is effected with air at increased pressure such as 10.30 atmospheres, and the nitrogen oxides are separated from the products by refrigeration, this separation being effected under a pressure not less than the pressure used in the oxidation. In the Provisional Specification, pressures of 2.30 atmospheres are mentioned for the oxidation.

Dehydrating and Distilling Tar, Etc. T. O. Wilton, Hendon, London. British Patent, 127,700, of 1918.

Tar and other liquids are dehydrated and distilled by passage through a series of units each consisting of a coil in which the liquid is heated to a suitable temperature under pressure, and an expansion chamber in which the pressure is suddenly released so as to produce vaporisation of the lighter constituents. The tar is preheated, and is pumped, under a pressure of 30-50 lb. per sq. in., through a coil 1 heated to 160-190° C. The heated tar enters an expansion chamber 3 through a spring relief valve, and the reduction of pressure causes the water and light oils to vaporise. The vapours escape by a pipe 8 to condensers 9, 14, in which light oils and naphtha respectively are collected. The residues are

pumped, under a pressure of 30-50 lb. per sq. in., through a coil 2 heated to 230-300° C., and enters an expansion chamber 4. The resulting vapours are led by a pipe 18 to a first creosote condenser 19. The residues are led to a vessel 6, in which distillation is effected by free steam of about 300° C. The vapours are led by a pipe 22 to condensers 23, 28, in which anthracene and second creosote respectively are collected. The residual pitch is led to a cooler 31. The tar is preheated by use as cooling-agent for the condensers 28, 23, 9, and the cooler 31. The heating-coils 1, 2 may be arranged concentrically so as to be heated by the same furnace, the hot gases passing over the coils 2, 1 in succession. By-pass arrangements under thermostatic control provide for regulation of the temperature.

Purifying Coal-gas. W. G. Adam, London. British Patent, 127,431, of 1918.

Naphthalene and sulphur compounds are removed from coal-gas by passing it through animal or wood charcoal, preferably in a granulated condition. If it is desired that ethylene and other hydrocarbons shall remain in the gas, the quantity of charcoal used is limited; for example, to purify 12,000 cub. ft. of gas containing 35 grains of sulphur and 6 grains of naphthalene per 100 cub. ft., about 70 lb. of charcoal would be used. The charcoal may be revived by heating to a temperature of about 300° C., and again used.

Chlorinating India-rubber. H. M. Broadhurst and A. Lamble, Liverpool; S. J. Peachey, Davenport, Stockport; and United Alkali Company, Liverpool. British Patent, 127,481, of 1918.

In the production of a substance for use as a substitute for celluloid, leather, or the like by treating a solution of rubber with chlorine, or bromine or chlorine, the rubber is dissolved in benzene or a homologue. Chlorine is passed through the solution until the rubber has taken up approximately twice its weight of chlorine. The presence of catalysts is avoided. The hydrochloric acid produced is removed by heating, or neutralised, for example, by ammonia or lime.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Mixing Solids and Liquids. P. A. Mallet, Paris. British Patent, 127,805. Convention date, June 3, 1918.

The air or inert gas under pressure employed as agitating-means in the mixing of two liquids, or in the reaction between a liquid and a solid, is made to operate in a closed cycle, and loss by evaporation is reduced, for instance, in the treatment of hydrocarbons with sulphuric acid or soda.

Evaporation. E. Wirth-Frey, Aarau, Switzerland. British Patent, 127,807. Convention date, June 3, 1918.

In evaporating solutions by means of heat of the vapours generated, after they have been compressed, the pressure at which the evaporation is effected is reduced as the concentration increases, the temperature of the heating-vapour being kept constant. The liquor is concentrated by passage through a series of evaporators 1, 2, 3 in which successively reduced pressures are maintained by compressors 7, 18, 19 arranged in series and each communicating with the vapour space of its respective evaporator. The whole of the vapours generated are thus compressed to the same degree, and pass together from the compressor 7 through the heaters 4, 5, 6 of the evaporators.

Nitrogen. Elektrizitätswerk Lonza, Basle, Switzerland. British Patent, 127,852. Convention date, June 17, 1916.

Nitrogen is obtained by absorbing the oxygen from air in a solution of ammonium sulphite, which becomes oxidised to ammonium sulphate, in a counter-current apparatus such as a series of spraying-towers, at a temperature of, preferably, 70-75° C. Ammonia carried away by the gas may be recovered. The nitrogen obtained may be used in the manufacture of cyanamides, and the ammonium sulphite may be obtained by the union of ammonia made from cyanamide, and sulphur dioxide made from pyrites, sulphur, gypsum, etc.

Distilling Benzole. Soc Anon. des Etablissements Egrot, Paris. British Patent, 127,853. Convention date, March 1, 1917.

Benzole is rectified by continuous distillation in an apparatus comprising three column-stills *a*, *b*, *c*, through which the benzole is led in succession by pipes *e*, *p*, 1, the distillates obtained from the respective stills consisting of head products, benzene, and toluene. The residue emerging by a pipe 12 consists of solvent. The stills each consist of extraction-columns *a*, *b*, *c* surmounted by concentrating-

columns *a*, *b*, *c*, and are provided with heating means *a*, *b*, *c* and the usual condensing and refrigerating arrangements. The benzole flows through the plant under gravity; but if the apparatus is derived by modification of an ordinary discontinuous rectifying apparatus, the liquid may be pumped from still to still.

Thorium Compounds. Lindsay Light Company, Chicago, U.S.A. British Patent, 127,555. Convention date, May 29, 1918. Not yet accepted.

The purification or recovery of thorium compounds is effected by first producing the fluoride and then converting this into the anhydrous sulphate by digestion with sulphuric acid at a high temperature. The acid thorium—containing solution resulting from the digestion of, say, monazite sand with acid—is treated, preferably after a preliminary concentration of the thorium, with hydrofluoric acid or a soluble fluoride in the proportions required to precipitate the thorium as fluoride without bringing down any substantial amount of the rare-earth metals present. The filter-cake is heated at 300-400° C. with concentrated sulphuric acid. The resulting sulphate of thorium may then be separated from admixed sulphates of the rare-earth metals by treatment with a solution of sodium carbonate or bicarbonate to dissolve out the thorium as carbonate, or by interaction with sodium, potassium, or ammonium hydroxide, the resulting thorium hydroxide being purified by conversion into a crystallisable salt such as the sulphate.

Sulphonation of Benzene. E. Barbet et Fils et Cie., Paris. British Patent, 127,614. Convention date, May 1, 1916.

Benzene is sulphonated in a continuous manner by bringing a stream of benzene vapour into contact with a continuously-renewed body of hot fuming sulphuric acid, and continuously removing the sulphonic acid formed; the process may be applied to Borneo or Malay petroleum fractions containing benzene, the unattacked petroleum being separated from the sulphonic acid. Using the apparatus shown in Fig. 1, benzene vapour from a heater C is supplied to the bottom of a plate-column A, while fuming sulphuric acid is supplied to the top of the column from a heater D; the sulphonic acid formed flows off by a pipe *b* to a heat-exchanger B, in which it heats the entering benzene and then flows to a tank G; the petroleum vapours pass off to a condenser E, and the condensate is washed with water in a purifier H and collected in a tank K. The plate-column A contains, in addition to the usual plates M, Fig. 2, fitted with bubbling-hoods S, S', a number of plates M' provided with heating-coils T to maintain the temperature of the liquid on the plates; heating-coils may also be provided on the bubbling-plates.

column A contains, in addition to the usual plates M, Fig. 2, fitted with bubbling-hoods S, S', a number of plates M' provided with heating-coils T to maintain the temperature of the liquid on the plates; heating-coils may also be provided on the bubbling-plates.

Electrolytic Zinc. Electrolytic Zinc Company, of Australasia Proprietary, Melbourne, Australia. British Patent, 126,296. Convention date, April 27, 1918.

Solutions obtained from ores are purified by limestone and zinc dust or "blue powder," electrolysed with the addition of glue to counteract the prejudicial effects of cobalt, nickel, and other impurities not removed by these reagents, and again used for treating ore. This cycle of operations is repeated until excessive cobalt—say, more than 200-300mgr. per litre—has accumulated. The solution is then freed from cobalt. After this the cyclic process is resumed. Five pounds of glue per ton of zinc produced are added for solutions containing up to 100mgr. of cobalt per litre, and one pound of glue extra for each additional 50mgr. of cobalt. In one method for removing cobalt the solution is treated, preferably at about 75° C., with zinc dust or blue powder in the presence of arsenic and preferably copper, 12-15 parts of zinc, and 14 parts each of dissolved arsenic and copper being added for one part of cobalt. Addition of zinc is preferably effected in specified stages, a part of the copper and arsenic being kept back and added just before the last part of the zinc. In another method, lead peroxide is added to the solution containing a compound of manganese. Sixty parts of manganese and 6 of peroxide are employed for each part of cobalt. Calcium plumbate may be substituted for the peroxide. This treatment is preferably carried out at 40-50° C.

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

Abbey Chemical Company, Ltd., London, E.C.—Resolved July 28: That the company be wound up. A. H. Hughes, 67, Basinghall Street, E.C., incorporated accountant, liquidator.

Alpertown Rubber Company, Ltd., London, W.—W. H. Golding ceased to act as receiver March 31.

Treburland Wolfram and Tin Company, Ltd.—Claims to T. D. C. Parker, 87, Bishopsgate, E.C., liquidator; by August 30.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Dicks Asbestos Company (Wm. Frdk. Dick and Jno. Alex. Dick), formerly 51, but lately at 47, Fenchurch Street, E.C., asbestos merchants and manufacturers. June 6. Debts by W. F. Dick. (August 1.)

East Goonbarrow China Clay Kaolin Company (Wm. Jas. Adams and Jno. Stephens, as trustees of the will of R. H. Frdk. Stephens, deceased; Wm. Jno. Kelly, Wm. Martin, Thos. Martin, and Saml. Jas. Pascoe as trustees of the estate of Silas Pascoe, deceased), china clay merchants. July 10. Debts due to and owing by the said late firm will be received and paid by H. N. Wright, St. Austell, solicitor liquidator of the firm. (August 1.)

MARKET REPORTS.

TAR AND AMMONIA PRODUCTS

WEDNESDAY.

Benzole: London, 90%, 2s.; North, 1s. 10d. to 1s. 11d.; 50%, 1s. 10d.; North, 1s. 9½d., naked. Carbolie acid, crude, 60%, East and West Coast, nominally 1s. 5d. to 1s. 6d.; crystals, 30-40%, 8½d., f.o.b. Crude tar, London, 45s. to 50s.; Midlands, 44s. to 46s.; North, 45s. per ton, ex works. Pitch, 72s. 6d. to 75s.; East Coast, 65s., f.o.b.; West Coast, 53s. to 55s., f.a.s. Solvent naphtha, naked, London, 90-100%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 90-100%, naked, London, 2s. 1d.; North, 1s. 10d. to 1s. 11d. Crude naphtha, naked, 30%, 9d.; North, 7½d. to 8d. Refined naphthaline, £18. to £22.; salts, £6. to £7. Toluol, naked London, 2s. 6d.; North, 2s. 5d. Creosote, naked, London, 6½d.; North, 5½d. to 6d.; heavy oil, 6½d. to 7d. Anthracene, 40-45%, 6d. per unit. Cresylic acid, 95%, 2s. 7d. to 2s. 8d.; 97-99%, 2s. 9d. to 2s. 10d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: Home trade, £19. 10s. per ton; basis 24½%. Nitrate of soda, £21. to £22.

FERTILISER MATERIALS.

LIVERPOOL. THURSDAY

Nitrate of soda: There is no change in either the tone of the market or in the price of this material, and the quotation on spot for 95-96% quality is repeated at £20. 2s. 6d. per ton, net cash, f.o.r., prompt delivery. East Indian bone meal for shipment is without alteration, the nearest value of 4½% ammonia and 52% phosphates, August-October shipment, being £15. per ton, net cash, ex ship Liverpool. On spot Liverpool, holders require £15. per ton, net cash, for 44½% and 45% quality. Mineral phosphates are without alteration, and values are at present only nominal. Dried blood is scarce, the value being about 30s. per unit of ammonia per ton, net cash.

LONDON METAL MARKET.

THURSDAY

Copper: Standard brands, £96. to £96. 5s., cash; £97. to £97. 5s., three months; electrolytic, £103. to £114. Tin: Standard, £270. to £270. 10s., cash; £264. 15s. to £265. three months; Straits, £272.; English, £266. Lead: Soft foreign, £24. 15s.; English, £26. Spelter, £39; hard, £29. to £30. Antimony, English regulus, 90%, £42. Aluminium, £150. Nickel, £205., delivered, packages extra. Quicksilver, £23. to £23. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 30s. per unit.

MANCHESTER CHEMICAL MARKET.

THURSDAY

There is a continued steady improvement in demand for heavy chemicals, both for home and export trade, and values all round are well maintained. Some small resale lots of 70% caustic soda are still offered at £17. 10s. per ton; refined bicarbonate of soda, bags, at £8. 10s.; and 58% alkali at £7. 5s. per ton, all f.o.b. Bleaching powder unchanged at £15., softwoods, on rails. Soda crystals, bags, 82s. 6d. per ton. Roasted saltcake firmly held at 60s. per ton, carriage paid. Chlorates are lower: soda at 6½d. per lb., and potash 1s. per lb. Bichromates steady at recent rates. Recovered rock sulphur quiet at £17., on rails. Commercial hyposulphite of soda steady at £16. 10s. per ton. Pea crystals, £23. per ton. Phosphate of soda quiet at £25. per ton. Concentrated sodium sulphide, casks, £20. per ton. Demand for copper sulphate continues flat, and price is easier at £44. f.o.b. Liverpool. White powdered arsenic is exceedingly scarce, and price nominally £50. per ton. In potash salts,

carbonate, 80-85%, is dearer at £95. per ton; yellow prussiate firm at 1s. 9d. per lb. Soda steady at 7d. per lb. For lead salts there is an improved inquiry, and prices are well maintained: White acetate, at £84.; brown, £75.; and lead nitrate, at £56. per ton. Acetic acid and acetate of soda are unchanged. English brown acetate of lime firm at £10. 10s. to £11. per ton. American grey, £19., ex ship. Borax is scarce, and high prices are offered for near parcels. Copperas is moving off better, but quotations are easy. Oxalic acid quiet at 1s. 2½d. per lb.

SWANSEA MARKET REPORT.

THURSDAY.

Tinplate prices are firmer at 35s. to 36s. per box, on standard basis, f.o.b. Copper prices irregular at £91. prompt and £92. 2s. 6d. three months. Tin in better inquiry, with irregular quotations; some business has been done at £260. prompt and £254. 10s. three months. Lead selling more freely at £24. 7s. 6d. Spanish, and £25. 15s. English. Spelter remains steady at £38. 10s. Zinc sheets, £65., f.o.b., New York. Silver dearer at 58d. per ounce. Quicksilver, £23. 5s. per bottle. Antimony nominal, with English regulus, 90%, at £42. Nickel selling better at £205. per ton, including free delivery to London or equal. Aluminium, £150. Quiet business in oils: Linseed, 116s. per cwt., prompt; rape oil scarce and nominal; palm oil in better supply, Lagos and softs nominally £92., Benin £87. 10s. per ton. Turpentine quiet at £6. 5s. per cwt. Sulphate of copper rather dull at £43. 7s. 6d. per ton, f.o.b. Sulphate of ammonia steady; sales at £19. 10s. for delivery over current quarter. Nitrate of soda quiet and steady at 21s. 6d. per cwt., in bags. Petroleum very firm and dearer, American refined fetching 1s. 6½d. per gallon, in casks, at ship. Oxalic acid, 1s. 2½d. per lb. Arsenic dull at £48. per ton for white powdered, f.o.b. Pitch is considerably dearer at 53s. per ton, f.o.b., and supplies are scarce. Bone meal, 16s. per cwt. Galvanised sheets in better request at £28. to £29. per ton for 24g., in bundles, f.o.b.

TURPENTINE MARKET REPORT.

Messrs. James Watt and Son, Ltd., of 101, Leadenhall Street, London, E.C. 3, report that the stocks of turpentine on August 9 were: American, 29,547 barrels, compared with 7,330 barrels at the corresponding date of 1918; French, 46 barrels (14 barrels); and Spanish, 688 barrels (1,503 barrels). Deliveries during the week ended August 9 were 1,524 barrels, against 870 barrels last year, and since January 1, 43,303 barrels, compared with 15,720 barrels in 1918. The price on Saturday last was 126s. per cwt., compared with 118s. at the corresponding date of last year. September-December delivery was quoted at 127s. 6d., and January-April (1920) 129s.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

Business conditions have become more settled than they were last week, and inquiries have come more freely to hand. Bleaching powder has been quiet, the season conducing to this. Prices are £14. 10s. to £15. per ton, free on rail or conveyance, in buyer's packages, and £17. per ton for export. Chloride of calcium has been more in request, and is £8. to £11. per ton, in casks, f.o.r. Caustic soda has been in fairly active demand, and is £24. per ton for 76%, £22. per ton for 72%, and £19. per ton for 60 to 62%. Nitrate of soda has been rather more inquired for, and is £20. 10s. to £21. 10s. per ton. Saltcake has been in fair request, and is

£6. 10s. per ton, in casks, f.o.b. Soda crystals have been steadily called for, and are £5. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has again been in fairly active demand, and is £7. 5s. to £10. per ton, according to terms of delivery. Borax has met with a rather free inquiry, and is £42. per ton for ordinary, and £44. per ton for powdered, in bags. Ammonia alkali has been in good demand, and is £6. to £6. 5s. per ton, f.o.r. at works. Hyposulphite of soda has been more in request, and is £17. per ton for ordinary and £22. per ton for pea crystals. Sulphite has been quiet, and is £11. per ton for ordinary and £18. to £19. per ton for pea crystals, in 1cwt. kegs. Bichromate of soda has been in slightly better request, and is 9d. per lb. Phosphate of soda has been in moderate request, and is £25. per ton. Sulphide of sodium has been quiet, and is £20. per ton, in casks, and £22. per ton, in drums. Chlorate of potash has been quiet, and is 1s. 1d. to 1s. 3d. per lb. Permanganate of potash has been rather more in demand, and is 3s. 6d. per lb. Sulphate of potash has been but little inquired for, and is £40. per ton. Carbonate of potash has been in quietly steady demand, and is £85. to £90. per ton for 80 to 85%. Caustic potash has been in fair request, and is £90. to £100. per ton for 35° Bé. Nitrate of potash has been more inquired for, and is £54. to £60. per ton, and £40. per ton for ordinary. Canadian potashes have been but little in request, and in very small supply. Montreal first quality are £200. to £220. per ton, and second quality £190. to £210. per ton. Bichromate of potash has been rather more in demand, and is 1s. 6d. to 1s. 7d. per lb. Yellow prussiate of potash has been in fair request, and is 1s. 9d. to 1s. 10d. per lb. Sal ammoniac has been in quietly steady demand, and is £80. per ton for lump, £75. per ton for seconds, and £5. extra per ton for ground. Sulphate of ammonia has been in moderate request, and is £19. 10s. per ton, less traders' discount of 10s. per ton, free to nearest wharf or railway station, to September 30. Carbonate of ammonia has been in quietly steady demand, and is 6½d. per lb. Muriate has been but little in request, and is £50. to £60. per ton, according to quality. Magnesia has again been in fair demand. Carbonate is £3. 10s. per cwt., and sulphate £10. to £16. per ton, according to grade. Alum has been rather freely inquired for, and is £18. 10s. per ton for the home trade and £18. 10s. to £19. 10s. per ton for export. Aluminoferric has been very quiet, and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina has been more inquired for, and is £12. to £17. per ton, according to grade. Sulphur has been in very fair request, and stocks are still small. English kinds are: Flowers, £32. per ton; roll, £28. per ton; and rock, £22. per ton, in bags, f.o.r. Sicilian grades are: Flowers, £28. per ton; roll, £22. 10s. per ton; and rock, £17. 15s. per ton. Cream of tartar has sold more readily, and is £11. 5s. to £11. 10s. per cwt. Tartaric acid has been in very fair request, and is 3s. 1d. per lb. Boracic acid has been more inquired for, and is £72. per ton for crystals and £74. per ton for powdered. Oxalic acid has been in quietly steady demand, and is 1s. 3d. per lb. Citric acid has been in very fair request, and is 4s. 4d. per lb. White acetate of lead has again been very quiet, and is £85. to £90. per ton. Arsenic has been rather more in request, and is £48. to £50. per ton. Sulphate of copper has been more inquired for, and is £45. per ton for farm purposes in the United Kingdom; and £47. to £48. per ton, less 5%, in casks, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.

TUESDAY.

Business in heavy chemicals continues steady, and for home consumption caustic soda and bleaching powder are in good demand. Soda crystals locally are steady at £5. per ton, 2cwt. bags. Sulphur is scarce and firm at £23. 10s. to £24. per ton, net.

The following prices are per ton, net:—Bleaching powder, softs and hards, £15.; caustic soda, 74-77%, £23. 5s.; do., 70%, £22.; do., 60%, £20.; recovered sulphur, 2cwt. bags, £24.; hyposulphite of soda, 5-7cwt. casks, £19.; do., 1cwt. kegs, £25.; sulphite of soda, 5-7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75° Tw., £9. 12s. 6d.; do., 100° Tw., £10.; do., 140° Tw., £10. 10s.; soda crystals, 2cwt. bags, £5.; sulphate of soda (saltcake), in bulk, £3. 10s.; pure white sulphate of alumina, 14-15%, £19. 10s.; blanc fixe, £22.; chloride of barium, £27.; sulphide of sodium, crystals, £18.; do., refined concentrated solid, 60-62%, £25.; hydrate of barium, crystals, £56.

COALS.—Market here is very firm, with a strong demand. Work throughout the northern counties, Northumberland and Durham, is proceeding more satisfactorily. The supply of tonnage is ample, and the output is readily moved off. Prices nominally:—Best Northumbrian steam, 85s. to 90s. per ton; do., small, 45s.; do., seconds, 40s.; best Durham gas coals, 70s. to 72s. 6d.; do., seconds, 67s. 6d.; bunker coals, 60s.; do., seconds, 58s.; foundry coke, 70s. to 75s.; gas coke, 78s. 6d.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

During the past week prices of the different chemicals in the West of Scotland market remained on a firm level, and there are no quotable changes worth mentioning. Business on the whole was fairly good, but the present unsettled industrial conditions are tending to retard progress in various directions. Most orders being put through continue of somewhat small bulk, but the tendency is towards betterment. Current quotations are:—Arsenic, £42. per ton net, Glasgow; bicarbonate of soda, £8. 15s. and £10. per ton for 6-8 casks and 1cwt. kegs, Liverpool; boracic acid crystals, English refined, £72. for 2cwt. bags, and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £24. per ton, net, Glasgow; chlorate of potash, 1s. 1d. per lb., net, Glasgow; chlorate of soda 9d. per lb., net, Glasgow; citric acid, 4s. 4d. per lb., 5%, Glasgow; cream of tartar, 88%, £11. 5s. per cwt., net, Glasgow; sal ammoniac, £80. and £75. per ton, net, any port for first and second lump respectively; sal ammoniac crystals £5. 5s. per ton, net, Glasgow; saltpetre, £3. 4s. net, Glasgow; tartaric acid, 3s. 1d. per lb., 5%, Glasgow.

In the sea oil section the chief feature is the scarcity of the different products, and only one variety among the whale oils is now quoted. This is black, which is still going into the hands of buyers at 78s. Pale, yellow, and brown are now quite off, and the same remark applies to Newfoundland cod, pale seal, and Menhaden.

Conditions in the Glasgow coal market are almost back to normal again after the holidays, and work at the pits is now fully resumed. Outputs continue to move off, without much difficulty, but business for export is still being carried on in a very limited way. Home demands are keeping steady, and prices are without change.

Brisbane (F.), 1 cs., £16.; Buenos Ayres, 1 cs., £8.; Lisbon, 4 cs. (pt.), £11.; Rio de Janeiro, 1 cs. (pt.), £26.; Sao Paulo, 5 cks. (pt.), £17.

POTASSIUM CARBONATE

Brussels, 2 kgs., £38.; Rio de Janeiro, 2 pkgs. (pt.), £20.

POTASSIUM CITRATE—

Alexandria, 1 cs. (pt.), £8.; Brisbane, 1 cs., £31.; Christiania, 2 cs. (pt.), £8.; Durban, 1 cs., £15.; Melbourne, 4 cs. (pt.), £55.; Sydney, 8 cs., £160.

POTASSIUM CYANIDE—

Rio de Janeiro, 2 c., £43.; Santos, 8 c., £101.; Sao Paulo, 1 cs., £15.

POTASSIUM HYPOPHOSPHITE—

Christiania, 1 cs. (pt.), £9.

POTASSIUM IODIDE—

Buenos Ayres, 1 cs. (pt.), £38.; Christchurch, 2 cs. (pt.), £77.; Christiania, 3 cs. (pt.), £225.; Foochow, 1 cs. (pt.), £9.; Gothenburg, 2 cs., £375.; Rio de Janeiro, 3 pkgs. (pt.), £112.; Santos, 17 pkgs. (pt.), £50.

POTASSIUM METABISULPHITE

Italy, 9 pkgs., £110.

POTASSIUM NITRATE

Barcelona (F.), 1 t., £51.

POTASSIUM PERMANGANATE—

Christiania, 1 cs. (pt.), £12.; Ipoh, 1 cs. (pt.), £18.; Rio de Janeiro, 31 pkgs. (pt.), £50.

POTASSIUM PRUSSIANE—

Rio de Janeiro, 15 pkgs. (pt.), £311.

POTASSIUM SULPHIDE—

Rio de Janeiro, 4 cks. (pt.), 9 pkgs. (pt.), £44.

POTASSIUM SUPEROXALATE—

Melbourne (F.), 1 kg., £11.

PYROGALLIC ACID—

Amy, 1 cs., £8.; Bangkok, 1 cs. (pt.), £8.; Hong Kong, 1 cs., £15.; Hankow, 1 cs., £15.; Tokio, 2 kgs., £43.

QUININE—

Antwerp, 50 ozs.; Bombay, 358 ozs.; Calcutta, 3,000 ozs.; Grenada, 608 ozs.; Rio de Janeiro, 413 ozs.

RED LEAD—

Hong Kong, 14 t.

SALICYLIC ACID—

Antwerp, 54 kgs., £480.; Brisbane, 1 cs., £12.; Copenhagen, 5 pkgs., £50.; Paris, 40 cks., £606.

SALT—

Antwerp, 1 t.; Auckland, 8 t.; Beira, 3 t.; Buenos Ayres, 6 t.

SALTPETRE

Barcelona, 4 t., £202.; Durban, 15 c., £48.; East London, 4 c., £16.; Lisbon, 5 t. 12 c., £279.; Malta, 2 c., £7.; Pt. Elizabeth, 18 c., £63.; Rio de Janeiro, 2 t. 8 c., £156.; Sao Paulo, 4 t. 18 c., £293.; Singapore, 2 c., £7.

SHEEP DIP—

Buenos Ayres, 14 t. 19 c., £1,200.; Pt. Elizabeth, 5 t. 3 c., £375.

SILVER NITRATE

Colombo, 1 cs. (pt.), £19.; Hong Kong, 1 cs., £75.

SIZE—

Rotterdam, 28 t. 15 c.

SOAP—

Adelaide, 11 c.; Alexandria, 10 c.; Amsterdam, 1 t.; Antofagasta, 4 c.; Antwerp, 123 t. 7 c.; Auckland, 7 c.; Bangkok, 7 c.; Barcelona, 1 t. 5 c.; Bombay, 3 t. 16 c.; Boston, 1 t.; Boulogne, 166 t. 14 c.; Brisbane, 5 c.; Buenos Ayres, 1 c.; Calcutta, 1 t. 14 c.; Cape Town, 3 c.; Christiania, 2 c.; Colombo, 1 c.;

SOAP

Copenhagen, 2 c.; Cuba, 4 c.; Dantzig, 10 t. 19 c.; Dieppe, 1 c.; Djibouti, 2 c.; Durban, 6 c.; East London, 3 c.; Foochow, 3 c.; Ghent, 3 t. 5 c.; Genoa, 1 t. 3 c.; Gibraltar, 5 c.; Gothenburg, 1 c.; Hankow, 1 c.; Hong Kong, 14 c.; Italy, 1 c.; Karachi, 12 c.; Lyttleton, 2 c.; Madras, 1 c.; Melbourne, 1 c.; Monte Video, 16 c.; Montreal, 9 c.; Odense, 6 c.; Ostend, 12 c.; Perth, 3 c.; Pt. Elizabeth, 1 c.; Pt. Swettenham, 4 c.; Punta Arenas, 13 c.; Rangoon, 1 c.; Rotterdam, 12 c.; Salonica, 3 c.; Shanghai, 1 c.; Singapore, 16 c.; Sydney, 5 c.; Toronto, 2 t. 2 c.; Trinidad, 12 c.; Valparaiso, 12 c.; Wellington, 1 t. 6 c.; Yokohama, 12 c.

SODA ASH—

Genoa, 9 t., £150.; Ostend, 1 t., £8.

SODIUM BENZOATE—

Brussels, 2 kgs., £55.; Christchurch, 1 cs. (pt.), £17.; Rio de Janeiro, 3 pkgs. (pt.), £63.

SODIUM BICARBONATE

Canton, 4 c., £5.; Cayenne, 5 c., £5.; Copenhagen, 5 t. 1 c., £55.; Durban, 7 c., £12.; Gothenburg, 1 t., £18.; Lisbon, 10 c., £8.

SODIUM BROMIDE—

Copenhagen, 1 cs. (pt.), £18.; Lisbon, 4 cs. (pt.), £5.

SODIUM CARBONATE

Athens, 2 cks., £6.; Calcutta, 3 cks., £9.; Gothenburg, 13 cks., £56.

SODIUM CHLORATE

Rio de Janeiro, 1 cs., £10.

SODIUM CITRATE

Alexandria, 1 cs. (pt.), £7.; Durban, 1 cs., £6.; Melbourne, 3 cs. (pt.), £29.; Sydney, 2 cs., £24.

SODIUM GLYCEROPHOSPHATE

Bordeaux, 5 cs., £280.; Copenhagen, 1 cs., £18.

SODIUM HYDROSULPHIDE

Gothenburg, 20 kgs., £336.

SODIUM HYDROSULPHITE

Brussels, 2 cks., £39.; Genoa, 26 kgs., £324.; Melbourne, 10 kgs., £173.; Sydney, 20 kgs., £350.

SODIUM HYPO

Copenhagen, 16 c., £21.

SODIUM HYPOPHOSPHITE—

Christiania, 1 cs. (pt.), £7.

SODIUM HYPOSULPHITE

Bombay, 1 t., £23.

SODIUM PHOSPHATE—

Delagoa Bay, 10 t. 1 c., £317.

SODIUM SALICYLATE

Calcutta, 1 cs. (pt.), £11.; Colombo, 1 cs., £13.; Montreal, 2 cs. (pt.), £8.; Perth, 1 cs. (pt.), £7.; Sydney, 2 cs., £37.; Sao Paulo, 1 cs., £5.

SODIUM SULPH.

Colombo, 4 c., £5.

SODIUM SULPHATE (GLAUBER

SALTS): Alexandria, 4 c., £8.; Rio de Janeiro, 10 c., £8.

SODIUM SULPHITE—

Hankow, 5 c., £6.

SODIUM TARTRATE—

Brisbane (F.), 2 cs., £20.; Melbourne, 1 ck., £10.

SULPHUR

Bahia, 1 t., £40.; Gothenburg, 3 t. 10 c., £198.; Lisbon (F.), 3 t., £83.; Rio de Janeiro, 10 c., £15.

SULPHUR (FLOWERS)—

Cape Town, 18 t. 18 c., £506.; Lisbon, 3 t., £96.

SULPHURIC ACID

Ascension, 2 t. 17 c., £100.; Singapore, 1 c., £13.

SULPHUROUS ACID—

Valparaiso, 2 cybs., £29.

STOCKHOLM TAR—

Canary Isles, £6.

TANNIC ACID

Brisbane (F.), 1 cs., £20.; Gothenburg (F.), 2 cks., £158.; Shanghai (F.), 1 cs. (pt.), £7.

TARTARIC ACID—

Cayenne, 1 cs. (F.), £7.; Copenhagen, 5 c. (F.), £95.; Durban, 2 c., £34.; East London, 3 c., £57.; Hamilton, Ont., 1 t., £310.; Madras, 1 c., £21.; Montreal, 3 t., £930.; Perth, 1 c., £16.; Toronto, 1 t., £310.

TERPINE HYDRATE—

Stockholm, 4 kgs., £27.

THEOBROMINE—

Buenos Ayres, 1 cs., £55.; New York, 2 cs., £250.

TIN OXIDE—

Sydney, 1 ck., £8.

WAX—

Osaka, 2 t.; Ostend, 10 c.

WHITE LEAD

Antwerp, £1,491.; Boulogne, £142.; Calcutta, £59.; Cape Town, £47.; Christchurch, £28.; Jamaica, £73.; Ostend, £315.; Rio de Janeiro, £14.; Santos, £10.; Shanghai, £97.

ZINC SULPHIDE

New York, 2 cks., £90.

ZINC SULPHOCARBONATE—

Melbourne, 1 cs. (pt.), £5.

MANCHESTER.

Week ending August 9.

ALUM (AMMONIA)—

Alexandria, 62 brls.

ALUMINA SULPHATE

Antwerp, 59 cks.; Bombay, 121 cks.

AMMONIUM MURIATE

Alexandria, 15 cs.; Montreal, 17 cks.

BASIC SLAG

Montreal, 2,500 bgs.

CAUSTIC SODA

Alexandria, 248 drms.; Rotterdam, 22 brls.; Rouen, 11 drms.

COAL PRODUCTS—

Tar: Alexandria, £2,375.; Genoa, £7,118.; Havre, £128.; Rotterdam, £187.

DISINFECTANTS (otherwise undes.)

Montreal, 26 cs.; Rotterdam, 25 cks.

DYESTUFFS (otherwise undescribed)

Alexandria, 20 drms.

DYESTUFFS—

Logwood Extract: Bombay, 1 cs.; Rotterdam, 1 ck.

Tanning Extract: Rotterdam, 150 brls.

FORMALDEHYDE

Antwerp, 56 brls.

GLYCERINE—

Alexandria, 15 cs.

HEMATINE CRYSTALS

Bombay, 10 drms.; Genoa, 7 brls.

MAGNESIUM SULPHATE—

Alexandria, 20 kgs.

MANGANESE ORE

Philadelphia, 400 t.

MANGANESE RESINATE—

Antwerp, 2 cks.

MANGANESE SULPHATE—

Antwerp, 1 ck.

POTASSIUM BICHRIMATE—

Alexandria, 3 cks.

POTASSIUM CARBONATE—

Montreal, 2 cks.

SALAMMONIAC

Alexandria, 10 brls.

SALT

Antwerp, 5,297 pkgs.; Montreal, 7,200 sks.; Quebec, 1,600 sks.

SOAP

Alexandria, 1,625 cs.; Lyttleton, 38 cs.; Montreal, 29 pkgs.; Rotterdam, 80 pkgs.

SODA ASH—

Alexandria, 50 bgs.; Genoa, 1,997 bgs.

SODIUM BICARBONATE

Alexandria, 30 kgs.; Antwerp, 100 bgs.

SODIUM BISULPHITE—

Alexandria, 4 cks.

SODIUM CARBONATE—

Genoa, 100 bgs.

SODIUM HYDROSULPHATE—

Bombay, 3 cs.; Philadelphia, 60 kgs.

SODIUM HYDROSULPHITE—

Genoa, 3 cs.

SODIUM NITRATE—

Bombay, 1 kg.

SODIUM PRUSSIANE

Genoa, 5 cks.

SODIUM SILICATE

Alexandria, 80 cs.

SODIUM SULPHIDE

Havre, 4 cks.; Rouen, 24 cs.

TALLOW—

Alexandria, 36 brls.

ZINC MURIATE

Bombay, 175 drms.

MIDDLESBROUGH.

Week ending August 9.

AMMONIUM SULPHATE

Kobe, 80 t., £1,317.; Yokohama, 318 t. 18 c., £5,428.

BLEACHING POWDER

Rouen, 25 t. 2 c., £330.

COAL PRODUCTS—

Benzole: Dieppe, 50 t. 5 c., £1,173.

Naphthalene: Dieppe, 107 t. 19 c., £3,287.

Pitch: Antwerp, 811 t. 10 c., £2,635.

MAGNESIA (CALCINED)

Dieppe, 9 c., £59.

MAGNESIUM CARBONATE—

Dieppe, 14 c., £48.; Rouen, 10 t., £391.

NEWCASTLE-ON-TYNE

Week ending August 9.

ANTIMONY—

Antwerp, 2 t.

BARIUM BINOXIDE—

Antwerp, 9 c.

BLEACHING POWDER—

Gothenburg, 7 t. 3 c.

CAUSTIC SODA—

Gothenburg, 10 t. 3 c.

LITHARGE—

Antwerp, 19 c.

SOAP—

Antwerp, 1 t. 8 c.

SODIUM CARBONATE—

Antwerp, 1 t.

SODIUM SULPHIDE—

Gothenburg, 4 t. 15 c.

WHITE LEAD—

Antwerp, 3 t. 2 c.

N. & S. SHIELDS.

Week ending August 9.

CHEMICALS (otherwise undescribed)

Christiania, £250.

STOCKTON-ON-TEES.

Week ending August 9.

NIL.

SWANSEA.

Week ending August 9.

NIL.

PRICES CURRENT.

THURSDAY, August 14, 1919

PREPARED BY MESSRS. HIGGINBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified
The prices in different localities may vary

Acids:—

		£	s.	d.
*Acetic 40% and 60%	per cwt.	31/-	&	47/-
* " Glacial	per ton	85	0	0
Arsenic, S.G. 2,000°	per ton	55	0	0
Boric, Crystals	per ton	72	0	0
*Fluoric	per lb.	0	0	0
*Muriatic (Tower Salts), 28° Tw.	per carboy	0	6	0
*Nitric, 80° Tw.	per ton	31	0	0
Oxalic	per lb.	0	1	2
Phosphoric, 1,750°	per ton	0	1	0
*Sulphuric (fuming, 70%)	per ton	—	—	—
* " (Pyrites, 168°)	per ton	7	18	0
* " (" 140°)	per ton	4	10	0
* " (free from arsenic, 144°)	per ton	5	7	0
Tannic (commercial)	per lb.	0	2	6
Tartaric (crystals)	per ton	0	3	1
*Acetone	per ton	80	0	0
*Alum, loose lump (delivered)	per ton	17	0	0
Alumina Sulphate (pure)	per ton	17	0	0
Aluminoterric (in slabs)	per ton	8	10	0
Aluminium (Ingot Metal, 98/99%)	per ton	150	0	0
*Ammonia, Anhydrous	per lb.	0	1	10
* " 880	per ton	33	0	0
* " 920	per ton	20	0	0
" Carbonate	per lb.	0	0	6½
" Muriate (grey)	per ton	50	0	0
" (sal ammoniac) 1st & 2nd, per cwt.	per cwt.	80/-	&	75/-
" Nitrate	per ton	60	0	0
" Phosphate	per ton	110	0	0
" Sulphate (grey), London, net	per ton	—	—	—
" " " Hull	per ton	—	—	—
" " " Manchester	per ton	—	—	—
*Aniline Oil (pure)	per lb.	0	1	2
Aniline Salt	per ton	0	1	2
Antimony	per ton	45	0	0
" (tartar emetic), 43/44%	per lb.	0	3	4
" (golden sulphide)	per lb.	0	1	3
Arsenic, white powdered	per ton	5	0	0
Barium Chloride (in casks)	per ton	24	0	0
" Carbonate (native), 92/94%	per ton	11	10	0
" Sulphate (native levigated)	per ton	£ 7 to £ 14		
Baryta Chlorate	per lb.	0	1	3
*Bisulphide of Carbon	per ton	55	0	0
Bleaching Powder, 35%	per ton	15	0	0
* " Liquor, 7%	per ton	6	0	0
Casein (commercial)	per ton	85	0	0
Chromium Acetate (crystals)	per lb.	0	1	6
Calcium Chloride	per ton	8	0	0
China Clay (at Runcorn), in bulk	per ton	70/-	to	90/-

Coal-tar Products and Dyes:—

Alizarine (artificial), 20%	per lb.	0	2	0
Magenta	per lb.	18/-	to	35/-
Anthracene, 40/50% A, f.o.b., L'don, per unit,	per unit	6	to	7
Benzol, 90's (naked)	per gal.	0	2	0
" 50/90's	per gal.	0	1	10
Carbolic Acid (crude, 60°)	per lb.	0	1	5½
" (crystallised, 40°)	per lb.	0	0	8½
" Acid (pale liquid, 97/98%)	per gal.	0	2	9
*Creosote (ordinary), naked	per ton	0	0	6½
*Crude Naphtha, 30% at 120°C.	per ton	0	0	9
*Grease Oils, 18° Tw. (naked)	per ton	6	10	0
Pitch, f.o.b., Liverpool or Garston	per ton	2	14	0
*Solvent Naphtha, 90% at 160°	per gal.	0	2	1
Copper	per ton	96	5	0
" Sulphate	per ton	44	0	0
" Oxide (copper scales)	per ton	85	0	0
Dross Salts	per ton	39	0	0
*Glycerine (crude), 80%	per ton	72	0	0
* " (industrial, S.G. 1,260)	per ton	110	0	0
*Iodine	per oz.	0	1	0
*Iron Nitrate, 80° Tw.	per ton	12	0	0
" Sulphate (copperas), delivered	per ton	4	10	0
" Sulphide	per ton	7	15	0
Lead (Foreign Pig)	per ton	25	0	0
" Litharge Flake	per ton	4	0	0
" Acetate (white), (ex ship)	per ton	84	0	0
" (brown)	per ton	75	0	0

Lead, Carbonate (White lead), pure	per ton	£	s.	d.
" Nitrate	per ton	51	0	0
Lime, Acetate (brown)	per ton	56	10	0
" (grey), 80% (ex ship)	per ton	10	10	0
Magnesium Chloride	per ton	19	0	0
" Carbonate (light)	per cwt.	15	10	0
" Calcined Magnesite	per ton	3	0	0
" Sulphate (Epsom Salts) (coml.)	per ton	22	10	0
" (druggists)	per ton	11	0	0
Manganese, Sulphate	per ton	16	0	0
" Borate	per ton	80	0	0

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the Chemical Trade Journal and Chemical Engineer—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ..	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

Trade Advertisements, Announcements, in the Directory Columns, and Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

Advertisers would oblige by writing advertisements and letters of instructions on separate sheets of paper.

EDITORIAL NOTICES.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than Wednesday morning.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

CURRENT TOPICS.

THE GOVERNMENT AND TRADE.

AS was to be expected, the Prime Minister's statement on the future trade and industrial policy of the Government has pleased nobody in its entirety. Perhaps the chemical and the optical glass and lenses industries have the most reason to be satisfied, although we are still very much in the dark as to the nature of the proposals which are to be put into force for their protection. Let us first of all express the hope that the warning of the Prime Minister as to under-production will be taken seriously to heart, although if we read human nature aright, it will be ignored, as have so many previous warnings, until dire personal necessity drives the malcontents to see the folly of their ways. That was sufficiently demonstrated in the Yorkshire coal strike. At the same time, the coal problem promises to play a leading part in the political and industrial situation. The Government's decision not to nationalise the mines in the way the miners have been agitating for has clearly ruffled the tempers of the leaders of the men, but we are doubtful whether a strike to force nationalisation upon an unwilling Government and—leaving out the miners and a few other extremists—an unwilling country, would have the support of the rank and file, having regard to recent events in Yorkshire. We are inclined to think that the responsible section of labour is beginning to realise that it has pressed demands which have reached not only the limits of the capacity of the industries with which they are concerned, but also the limits of the patience of the remainder of the community, and that they will pause before attempting any further extreme measures.

We now come to the Government's proposals for dealing with imports, dumping, and key industries. We are told that after September 1 all restrictions on imports will be removed, but it does not appear that any settled policy is to take its place. Anti-dumping legislation is promised on the lines already adopted in some of the Colonies, but it must be remembered that they all have

a high protective tariff, and it is doubtful if such action would be effective when attempted in connection with "free trade," which, it would appear, the Government are still afraid to abandon. In any case the proposals are at present too vague for anything more than general criticism. We notice that an effort is to be made to prevent the importation of goods at very low prices owing to the position of the exchange rates between this country and Germany. It is admitted on all sides that an increased export trade by Germany will have the effect of making the exchange more favourable to that country. Is it, therefore, seriously proposed that as Germany's wealth and foreign trade increase we should lower our trade defences? No country has ever yet had so insane a trade policy, and we hesitate to believe such a scheme will be put into practice. As to "key industries," a term almost impossible to define, confusion has been added to the question by describing some industries as "unstable industries." If an industry is essential to the needs of the country it must be encouraged, and the lessons of the of the war will be lost if we depend in future for essential products on foreign countries. It seems to us that any attempt to deal with this subject on a narrow basis, such as appears to be the case, and to neglect the all-round security of our main industries, is to court disaster.

The details of the proposals we have yet to see. Whether they will carry out what appears to be intended is another matter. Much depends upon who will have the responsibility of making the many important decisions which will have to be come to. The synthetic dyes and optical glass and lens industries were specially mentioned by the Prime Minister as industries which he thinks need protection, and the experience of the past five years shows there can be no question of that. For the rest, the speech was a long and somewhat overdrawn condemnation of the policy Labour is pursuing, and of the profligacy of expenditure of the individual members of the public, together with a perfectly truthful picture of the ruin to which the country is fast approaching if it does not mend its ways, but hardly a word of practical suggestion was made of economy of public expenditure, and we venture to think that it is that which caused Mr. Lloyd George's speech to have such a bad "Press" throughout the whole country.

CELLULOSE ACETATE.

THE Committee appointed by the Government twelve months ago to inquire into the allegations contained in the fifth report of the Select Committee on National Expenditure regarding the circumstances of the formation and financial arrangements of the British Cellulose and Chemical Manufacturing Company, Limited, and their relations with Government Departments, have at last issued their report. With the financial part of the inquiry we are not greatly concerned. The conclusion of the Committee in respect of the share capital of the company, which at the time of the Committee's appointment mostly closely excited public interest, is that "the contrast between the nominal capital of the original company and that of the present company is indeed so glaring that, for much of the criticism to which they have been exposed, we think that the promoters and others concerned with the Company's financial arrangements have only themselves to thank." From the point of view of the British chemical industry, however, the most important part of the report is that which relates to the refusal of the responsible Department of the Ministry

of Munitions to allow British manufacturers to undertake the manufacture of cellulose acetate. The facts of the situation are carefully summarised by the Committee, and it is difficult to reconcile with these facts their opinion that the officials of the Supply Department were justified in confining the source of supply to the one concern. At least two important British firms commenced negotiations, but their offers to erect plant for the manufacture of the material were rejected. The position in regard to the supply of cellulose acetate was very grave indeed, and the Department refused outside offers of assistance on account of the delay which would necessarily arise before deliveries could commence. It is necessary to observe that the first proposal of the United Alkali Company was made in May, 1916, and the second in October of the same year, whilst the British Cellulose Company commenced deliveries, "and then at first only on a small scale," in April, 1917. The statements of the Committee that "the War Office relied on somewhat sanguine anticipations expressed by Dr. Dreyfus which were not realised," and that "the Company had disappointed the anticipations formed as to the date when it would begin its British manufacture," are sufficient proof that matters were anything but satisfactory. Yet in the face of such a situation the offers of British manufacturers were turned down, and the country exposed to the risk of further "disappointment" with all its consequences.

NATIONAL EXPENDITURE.

THE long overdue outcry against the waste of national expenditure has a very distinct interest for the industries of the country, for the reason that this waste constitutes, in the inevitable taxation which must follow, a very heavy burden upon all our industries. The heavy drain of taxation during the war was a constant cause of complaint on the part of those responsible for maintaining our industries in as efficient a state as possible with a view to after-war developments, but with peace signed and our daily expenditure still going on of some 60 per cent. of the maximum war-time expenditure, it is high time that industrialists took a hand in the game and lent the weight of their protest and influence to that of the very few economists in Parliament who have the courage to say what the general public has long been thinking and discussing. Some of these economists, too, have acquired the habit of facing both ways judging by the recent occasion on which they thoroughly condemned certain Government proposals and then voted for them. So far as the general position is concerned, it is perfectly true that the excess profits tax has been reduced by one half, and that no increase was made in the last Budget in income tax, but that was admittedly a policy adopted to give time to watch the trend of events. Since then the whole tendency of public expenditure has been to create more than a possibility that very heavy increases will have to be made in national taxation, and these, coming on the top of the large additional levies that are being made all over the country in local taxes, will have a most damaging effect industrially. For industry to develop as freely as it should do under the exceptional prevailing conditions even the 40 per cent. excess profits tax should be removed, instead of which we are faced with additional demands in some form or other. All this, at a time when so many people are holding their hands because of the uncertainty as to the future trade policy of the country, does not suggest that the Government have really got a grip of the essentials of the situation.

THE PROGRESS OF ANALYTICAL CHEMISTRY.*

By C. AINSWORTH MITCHELL.

THE decrease in the number of papers which characterised this branch of chemistry last year has been still more pronounced during the past twelve months. As was to be expected, there have been relatively few contributions from German sources, whilst American journals have again been responsible for a large proportion of the published work.

Owing to the intensified shortage of materials, further attention has been given to the recovery of expensive reagents after use in analysis, and to devising apparatus and methods for which cheaper or more available substances are required. For example, an alloy of about 11 per cent. of platinum with 89 per cent. of gold has been used as a substitute for platinum for chemical apparatus, and it has been shown that manna can replace glycerol in the titration of boric acid.

Physical Methods.

Attention was directed in last year's report to certain sources of error in the methods of determining viscosity by means of the standard instruments, and to some of the suggestions which have been made to overcome these drawbacks. To obviate the effect of variations in the pressure due to the height of the column of liquid over the orifice, an apparatus has been constructed in which the liquid is driven at a definite temperature through the opening by means of measured centrifugal force, and the viscosity is expressed in terms of the acceleration due to gravity (g). In this connection, mention may also be made of a modified form of "mercurial viscosimeter" intended for volatile liquids. In this instrument, an equal excess pressure is produced by means of an attachment above and below the column of liquid.

There have been several further applications of the use of the spectroscope to analytical work. For example, a definite weight of a mineral containing a particular element is vaporised, and a screen in which is a horizontal slit is made to travel vertically at a measured velocity in front of the vapour. From the length of time during which a given ray of the element remains visible, the quantity of that element may be calculated.

Another quantitative spectroscopic method has been used for the estimation of rubidium and caesium in plant ash. The potassium, rubidium, and caesium are separated as platinum-chlorides and converted into chlorides, and the solution is compared spectroscopically with standard solutions of the chlorides of the same elements prepared under the same conditions.

An accurate means of titrating the acidity of coloured solutions has been based on the difference of the absorption spectra of certain indicators in acid and alkaline solutions. Equal quantities of an indicator are added to water and to the liquid under examination, and alkali is run in until the characteristic absorption band, observed with a pocket spectroscope, is seen in the same position in each case.

The spectroscopic method affords a sensitive test for boron, being capable of detecting 1 part in 10,000.

An optical method of estimating potassium and sodium has been based on the difference between the refractive indices of the respective chlorides in a 20 per cent. solution at 25°, that of sodium chloride being 1.36829, and that of potassium chloride 1.35992. Hence the relative proportion of the two salts in admixture may be calculated from the refractive index of the solution.

For the estimation of malic and tartaric acids in the presence of each other, advantage has been taken of the fact that the optical rotation of *l*-malic acid and of *d*-tartaric acid is increased by uranyl acetate, whereas the rotation of *l*-malic acid is reversed by ammonium molybdate. By plotting the optical rotations of each acid in solutions up to 1 per cent. in one case activated with uranyl acetate and in the other with ammonium heptamolybdate, two series of curves sloping in opposite directions are obtained. The points of intersection of each correlated pair of curves will show the amount of tartaric acid on the abscissæ and that of the malic acid on the ordinates.

An optical method to which, of late years, increasing attention has been given is that termed nephelometry, or the measurement of the light reflected from a colloidal precipitate in suspension. The method is useful for the estimation of pre-

cipitates of light colour, those of dark colour being more suitably measured colorimetrically. Substances which may conveniently be estimated in this way include nitrogen, phosphorus, calcium, fats, and proteins. The term "nephelometric value" is suggested as a convenient description of the amount of turbidity produced by a given quantity of a substance in a definite time in comparison with that produced by a standard substance under the same conditions. This value varies with the concentration of acid in the suspension and alters with the change of turbidity on keeping, but for each substance there is an optimum acid concentration which produces the greatest turbidity with the least change within a definite period of time.

The detection of potassium by the flame test may be rendered much more sensitive by coating a glass plate with a gelatine film containing a mixture of two dyes, preferably patent-blue and tartrazine, in specified proportions. As seen through this screen, the potassium flame appears bright red with a border of yellowish-green. Only rubidium gives a flame of similar colour.

A new application of a physical phenomenon as an indicator in acidimetry has been described. A measured quantity of a mixture of vaseline oil and oleic acid is made to issue from a jet just below the surface of the acid liquid, and the number of drops is counted. On repeating this after successive additions of standard alkali, a sudden increase in the number of drops will be observed when neutrality is reached. The method thus depends on the measurement of the alteration in tension at the separation zone of two immiscible liquids.

Gas Analysis.

The catalytic absorption of hydrogen from a mixture of gases by means of sodium oleate containing metallic nickel in suspension cannot be recommended as an analytical process, since, apart from the difficulty of protecting the reagent from oxidation, the absorption of hydrogen is much too slow for quantitative work.

A method of estimating benzene vapour in gases has been based on the increase in volume which occurs when a measured quantity of the gas is introduced into a special apparatus containing benzene vapour. By determining the increase in volume which would have been produced by gas free from benzene, the necessary data for the calculation are obtained. Since, as a general rule, the vapour pressure of a liquid is independent of the nature of an inert gas above it, it is possible to estimate the amount of vapour, such as benzene, toluene, or xylene, in a gas, such as air, by determining the difference between the pressure of the mixture and that of the same gas completely saturated with the vapour. For this purpose two flasks are connected with a manometer, one of them containing the mixture, the pressure of which must be less than corresponds with complete saturation, and the other the gas by itself. Small bulbs containing the vapour are broken within each flask, and from the difference between the readings the pressure corresponding with the amount of vapour in the original mixture may be found.

In using the "chlorate pipette" for the absorption of hydrogen from gaseous mixtures, it is essential that all carbon monoxide should be removed, since otherwise the catalytic oxidation is retarded. In the case of pure hydrogen, the "relative absorption velocity" is fairly constant, or increases slowly until half of the gas has been absorbed, whilst traces of carbon monoxide cause a rapid reduction in the rate of absorption. Hence, by using a standardised pipette and constructing a curve showing the rates of absorption up to this point (half-volume) with different minute quantities of carbon monoxide, it is possible to estimate the proportion of the latter in the gas.

To obtain trustworthy results when using the Rayleigh interferometer in gas analysis, the gas chamber should be at least 1 meter in length, the gases compared must be at the same temperature and free from moisture, and the refractive index must be determined with great accuracy.

Agricultural Analysis.

The dearth of potassium salts, mainly due to the stoppage of German supplies, has caused attention to be directed to other possible sources of supply, such as felspar, dust from cement kilns, siliceous rocks, and the like. Hence the neces-

* Abstracted from the Chemical Society's "Annual Reports on the Progress of Chemistry for 1918."

sity for the accurate estimation of potassium is of paramount importance, and the various methods hitherto proposed have been subjected to critical examination during the past year.

There are little differences in the methods used for the extraction of soluble potassium salts from various materials, but in the case of substances, each as siliceous rocks, from which the potassium cannot be extracted by the citric acid process, various processes have been proposed. Trustworthy results are obtained by decomposing the material with pure hydrofluoric and sulphuric acids. After removal of iron, aluminium, manganese, and sulphuric acid, the alkalis are converted into chlorides, and the potassium is separated by the platinichloride or perchlorate method. One objection to the hydrofluoric acid method is that very thorough washing is required to remove all potassium from the barium sulphate precipitate. The Lawrence-Smith method, in which the material is heated with a mixture of calcium carbonate and ammonium chloride, then digested with water, freed from calcium, and the alkalis estimated in the filtrate, has the advantages of simplicity and of requiring reagents more readily obtainable than hydrofluoric acid in the pure condition; but, on the other hand, it leaves about 1 per cent. of potassium unattacked, and a second treatment is required to decompose this. If, however, the heating is continued for two hours at 170°C, the decomposition is complete in one operation. For the estimation of the potassium, the perchlorate method is quite trustworthy, although it is usually regarded as less accurate than the platinichloride method. The cobaltinitrite method is fairly satisfactory for materials containing 1 to 2 per cent. of potassium, but is liable to be erratic, and may yield too low results. A gravimetric modification of the method which is suitable for the estimation of potassium in soils, fertilisers, etc., has been devised. The method of calculating the proportions of potassium and sodium from the amount of chlorine in a weighed mixture of the chlorides has the drawbacks of most indirect methods. If the McLean-Van Slyke method is used for estimating the chlorine, the probable error in the amount of sodium increases with the decrease in the proportion of sodium to potassium, and is usually about 1 per cent. In another indirect method, the potassium is calculated from the amount of platinum in the potassium platinichloride.

The methods of estimating phosphoric acid in fertilisers, plant ash, etc., have been subjected to further critical examination during the year, and several new methods have been devised. In one of these methods, intermediate precipitation of phosphoric acid as molybdate is avoided. The ash is dissolved in acetic acid, the calcium separated as oxalate, and the phosphoric acid precipitated as magnesium ammonium phosphate, citric acid being used to prevent the precipitation of iron and aluminium. An analogous method has been recommended for the estimation of phosphoric acid in superphosphates. Another method is to precipitate the phosphoric acid as a basic compound of mercury by the addition of yellow mercuric oxide, to decompose the latter with sodium sulphide, and to precipitate the phosphoric acid as ammonium magnesium phosphate.

A precipitate of constant composition, $MgNH_4PO_4$, may be obtained by causing ammonia to diffuse slowly into the acid solution containing magnesia and phosphoric acid in the presence of ammonium chloride. In Schultze's method of adding ammonia to the hot solution containing ammonium chloride, the precipitate which separates on cooling is not pure. A second solution and reprecipitation give more trustworthy results.

The presence of ammonia interferes with the accuracy of the results obtained by titrating the phosphomolybdic precipitate with standard alkali when phenolphthalein is used as indicator. This may be obviated by precipitating the phosphoric acid as potassium phosphomolybdate. By adding a specified amount of ammonium nitrate to the solution before the addition of the ammonium molybdate, the precipitate will contain phosphoric oxide and ammonia in proportions corresponding with the triammonium compound, and the ammonia may be estimated by distillation with alkali and calculated into the corresponding amount of phosphoric acid.

A method of estimating inositol-phosphoric acids in feeding-stuffs and the like has been described. It seems probable that inositol-pentaphosphoric acid, $C_6H_7(OH)(H_2PO_4)_5$, is the only inositolphosphoric acid in the common feeding-stuffs.

Ammonia in soil extracts may be estimated by Folin's aeration method, the extract being mixed with magnesium oxide and aerated in the cold for three hours. The ammonia is absorbed in acid towers, and the acid subsequently distilled with alkali. Before estimating nitric nitrogen in the extract, it is necessary to eliminate proteins, which yield

ammonia when heated with sodium hydroxide. For this purpose the liquid is treated with copper hydroxide and filtered, and the nitric nitrogen in the filtrate estimated by reduction with Devarda's alloy and distillation of the ammonia.

A study of soil acidity and the hydrolytic ratio in soils has shown that there appears to be a definite relationship between the proportion of iron and aluminium compounds in a soil and its reaction towards litmus paper. In acid soils, the ratio

was found to exceed 1 : 1.3, and the amount of lime required to neutralise such a soil may be found by calculating the quantity required to be added to the acid-soluble calcium oxide to bring the ratio to 1 : 1.3.

Organic Analysis.

Qualitative.—There have been few additions during the year to the methods of identifying groups of organic compounds. The principal new general method of examination has been based on the use of an acetic acid solution of chromic acid as an oxidising agent, which under specified conditions oxidises organic compounds with the liberation of acetone and aldehydes. These products may be separated by distillation and identified by conversion into their *p*-nitrophenylhydrazones, which are relatively insoluble. By means of this test, methylpentoses, such as rhamnose, may be identified in the presence of pentoses.

It has been shown that the colour reaction given by lactic acid with thiophen and sulphuric acid is due to the formation of formaldehyde, and a sensitive test for aldehydes has been based on this fact. The shade of the red coloration given by aldehydes on treatment with an alcoholic solution of thiophen in the presence of concentrated sulphuric acid varies with the particular aldehyde. The test is capable of detecting 1 part of formaldehyde in 100,000.

Formic acid may be detected by heating the liquid with a concentrated solution of sodium hydrogen sulphite, and, after cooling, pouring a dilute solution of sodium nitroprusside on to the surface. In the presence of formic acid, sodium hyposulphite is formed from the sodium hydrogen sulphite, and this reacts with the nitroprusside to produce a blue or green ring, due to the compound $Na_4Fe_2(CN)_6$, whilst hydrocyanic acid is liberated.

A test for tartrates has been based on the solubility of cupric hydroxide in alkaline solutions of alkali tartrates. Although, by using potassium ferrocyanide for the detection of copper in the filtrate, this test is capable of detecting 0.2 milligram of tartrate, it cannot be regarded as distinctive, since other salts, including arsenites, borates, and phosphates, give a positive result in the absence of tartrates, whilst other compounds, including chromates, nitrites, and acetates, interfere with the reaction.

A distinctive reaction for acetylcarbinol is produced by boiling its solution with *o*-aminobenzaldehyde, cooling the liquid, and treating it successively with acid and with excess of sodium hydrogen carbonate. A blue fluorescence is obtained, and, on extracting the liquid with ether and evaporating the extract, 3-hydroxy-2-methylquinoline is left as a white residue, which gives a red coloration with an alcoholic solution of ferric chloride.

A sensitive reaction for mercury fulminate depends on the fact that it yields pararosaniline by heating with phenylhydrazine, subsequently diluting the liquid with alcohol, and adding a dilute acid.

Quantitative.—It is perhaps in this division of analytical chemistry more than in any other that the reduced amount of research is indicated. There have been very few contributions to the methods of elementary analysis. In using cerium dioxide and cupric acid as a catalyst in association with a mixture of lead peroxide and minium for a series of combustions of substances containing nitrogen, it is essential to ensure complete decomposition of cupric nitrate after each combustion.

In estimating nitrogen by Kjeldahl's method, the results are too low in the case of certain compounds, such as pyridine, piperidine, quinoline, and sometimes nicotine, possibly owing to the formation of sulphonic derivatives. To obtain accurate results for pyridine by the Arnold-Gunning modification, the heating should be continued for several hours after the solution has become clear. The results obtained by Kjeldahl's method are too low when the decomposition has been effected by means of sulphuric acid and mercury, and to obviate this it is necessary to add zinc-dust or potassium sulphide, followed by zinc turnings, prior to the distillation of the ammonia.

A modification of Denigès's colorimetric method of estimating methyl alcohol has been described in which the liquid is oxidised by means of potassium permanganate, and the resulting formaldehyde is estimated by means of Schiff's reagent (magenta decolorised with sulphurous acid) under the same conditions as standard solutions of formaldehyde.

A method of estimating formic acid has been based on its oxidation by means of chromic acid and measurement of the volume of carbon dioxide evolved in the reaction. Carbonates and oxalates, if present, are previously precipitated by means of calcium chloride, whilst acetates are not oxidised by chromic acid. The methods of estimating the lower aliphatic acids have been critically examined, and a new method of separating acetic, propionic, and butyric acids has been based on the fact that light petroleum (b. p. 150° to 300°) will extract most of the butyric acid and some of the propionic acid from the solution after saturation with calcium chloride and the addition of a small amount of potassium chloride. The acidity of the original solution and of the petroleum fraction, and the weight of sodium salts, dried at 200°, obtained from both liquids, give the data for the calculation. Butyric acid gives a red coloration when treated with hydrogen peroxide, ferrous ammonium sulphate, and sulphuric acid, and then with sodium hydroxide solution, sodium nitroprusside, and a slight excess of acetic acid. This colour reaction has been made the basis of a colorimetric method of estimating butyric acid.

A comparative study of the methods of estimating acetone has shown that Messenger's method, which depends on the formation of iodoform, gives incorrect results, whilst no improvement is effected by substituting arsenious acid for thiosulphate in the titration. Kebler's modification of Robineau and Rollin's method has been found the most trustworthy.

The work done in connection with the subject of oils and fats has been mainly concerned with the characteristics of individual fats, and few new methods of analysis have been introduced. For example, the composition of butter fat has been once more investigated by modern methods, including esterification, with results differing considerably from those previously recorded.

The measurement of the optical dispersion of oils from an analytical point of view has been studied, and it has been found that most of the common oils have very similar dispersions (0.0186 to 0.0207), with the exception of coconut oil (0.0167) and tung oil (0.0371).

Twitchell's method of estimating resin in soap is not applicable to resins other than colophony, and has the drawback that it causes pure fatty acids to show an apparent resin content. These objections are obviated by a method based on the fact that nitrated resins are insoluble in light petroleum, whilst the fatty acids after the nitration may be quantitatively separated from the solution.

A method of estimating phenol in the presence of the three cresols is based on the determination of the specific gravity and solidifying point of the mixture, the necessary data for the equation having been obtained empirically from the results given by mixtures of the pure substances.

Pyridine or pyridine bases in ammonium salts or ammonia solution may be estimated by precipitation with iodine in excess from a solution acidified with sulphuric acid. The excess of iodine is removed by means of thiosulphate, and the periodides are titrated with standard alkali, first with methyl-orange and then with phenolphthalein as indicator. The amount of pyridine sulphate is calculated from the difference between the two titrations. The sensitiveness of the method and completeness of the precipitation are increased by adding sodium chloride to the solution.

(To be continued.)

SOUTH AFRICAN INDUSTRIES.—The Standard Bank of South Africa reports in its monthly review that a large and increasing business is being done in cattle dip manufactured at Salisbury, Rhodesia. The price at which this can be sold compares favourably with that of the imported article, and a plant to manufacture from 6,000 to 12,000 gallons per month has recently been completed. The manufacturers contemplate extending their operations to the Union where it is intended to lay down similar plant which will also provide for the manufacture of arsenite of soda from the white arsenic produced at Odzi. The market in fertilisers is steadier, and brisk business is anticipated in connection with the requirements of the Transvaal and the Orange Free State for next mealie season, and of the fruit farmers in the Western Province.

GERMAN CHEMICAL INDUSTRY.

WORKS PREPARED FOR PEACE OPERATIONS.

DR. EDWARD C. WORDEN, the explosives chemical expert of the United States Bureau of Aircraft Production, Washington, who has just returned to London from a tour of the chemical industry in Germany, in a statement which appeared in *The Times* on Tuesday, said that Germany had solved the problem of the fixation of nitrogen as a commercial undertaking on a gigantic scale. In future, from the point of agricultural fertilisers, she would be independent of any blockade. Furthermore, the plant used in the process could be turned at the shortest notice to the manufacture of high explosives.

"Speaking generally," said Dr. Worden, "the chemical industry of Germany is, and has been since the Armistice, just as prepared for peace operations as though war had never interfered with it. The technical staffs of the great concerns are at their maximum numbers. The skilled workers seem as numerous as ever. If these men were engaged on war work it was either as clerical workers or as assistants of Government undertakings. They certainly never saw the trenches. The dye and pharmaceutical industries are in as strong a position as ever, if not a stronger. But the greatest achievement of the German lies in their working of a process for the successful fixation of nitrogen on a great commercial scale. The headquarters of this new industry is the Haber plant of the Badische Anilin and Soda Fabrik at Oppau, near Ludwigshafen, on the Rhine, to which the German Government since the Armistice has lent nearly 200 million marks.

"Begun since the Armistice, built with reinforced concrete, this factory has now between 8,000 and 9,000 actively employed. When completed it will have a storage capacity of 350,000 tons of ammonia ready to be turned into ammonium salts and a daily capacity of 2,800 tons, an amount sufficient, with potash and phosphates, to give an abundance of fertilisers for all German agricultural purposes. This building is only one of seven now in course of construction, and its one storage shed is equal in area to the whole of St. Pancras Railway Station. A few months ago the site was an ordinary marsh, but to-day the building contains such an intricate piece of plant as I have never before seen in all my experience. Up to the present about £150,000 has been expended upon it. The machinery is automatic throughout, the plant is practically duplicated in every part, there are four tracks between each set of buildings, and each building contains overhead automatic conveyances, while there are 3,500 telephones at work efficiently.

"Moreover, there is not the slightest trace of any odour of ammonia, which proves that in the manufacture of nitrogen there can be practically no loss. The success of the method employed—without going into any technical details—is due to the exceptional conservation of heat, the adoption of automatic calorimetric instruments throughout, and an extensive knowledge of critical temperatures and pressures in the most important stages. A small illustration will give an example of the German belief in this plant. A short time ago the French authorities wished to investigate. The management replied: 'Yes. Come by all means. See anything you wish to see. You could not duplicate the plant if you wished. You could not run it if it were yours.'

"But if Germany has secured a great success from an agricultural point of view, it must be remembered that she has achieved even more at the same time. Nitrogen is the central factor of all modern explosives. Not merely will the Germans henceforth be enabled to manufacture it on an unlimited scale for fertilising purposes, but, almost at a moment's notice, they will be in a position to utilise it for the manufacture of munitions on an enormous scale. Moreover, under the present process, their consumption of electrical energy per pound of nitrogen is very low."

Dr. Worden proceeded to give instances of German readiness as regards the chemical industries to enter the fields of international competition. "To take one example," he said, "the Bayer Company of Leverkusen, has substantially 3,000 tons of dye stuffs, chemicals, and pharmaceutical products ready for export now, either as finished products or in hand or in process.

"In all these factories," Dr. Worden proceeded "the employees are working in two shifts of 12 hours each. Apparently there is no difficulty either in regard to working hours or the amount of production. I fear," he said, "that both Great Britain and the United States will find themselves faced with

very severe competition from Germany in the chemical industries in years to come. The Germans have in their favour a general standard of fairly high education. In our countries we have a considerable number of exceedingly brilliant men; but we have also a vast majority of sub-normals as regards both education and intelligence.

"Moreover," he continued, "the policy of the Government during the war and since the Armistice is to advance sufficient sums to industry to compensate for their lack of raw materials—the present great weakness of the manufacturers—until their normal productive capacity is resumed. At the present time their settled project is to manufacture the articles whereof other countries are most in need and whereon the highest net profit can be realised."

EXPLOSIVES INSPECTORS' ANNUAL REPORT.

THE annual report for 1918 of H.M. Inspectors of Explosives states that eight new factories have been licensed during the year, making a total of 73 added since the outbreak of war, and as eight have become extinct in the last 12 months, the total number remains the same as at the end of the previous year, viz., 183. Now that special war work is at an end there is every probability that the number will be materially reduced during the present year.

The total number of accidents reported during the year shows a satisfactory decrease as compared with the two previous years, being 526 as against 701 in 1917 and 641 in 1916. The decrease is, moreover, especially marked in respect of accidents which have occurred in manufacture. This improvement is probably due to the increased experience of workers and supervisors. Of the 44 fatalities, 20 were due to two accidents, and it is somewhat remarkable that in neither case was there any explosion, nor was the material involved of an explosive character. The earlier of the two, by which seven persons were killed and two others seriously injured, occurred at the factory of the Standard Fireworks Company, of Huddersfield, in a building in which the mixing of composition for "deck flares" was carried on. The building was licensed for two persons only, but for some unascertained reason no less than nine persons were assembled there at the time of the accident. No machine mixing was in progress, and it is difficult to imagine how the fire could have been caused by the operation of hand mixing. In the other case the accident occurred during the manufacture of incendiary bombs at the Wood Lane factory of Messrs. W. E. Blake and Company, and resulted in the death of 13 persons. The ingredients of the composition, which is called "thermalloy," used in the manufacture of these bombs are finely powdered aluminium, oxide of iron, and sulphur, so that it is actually the well-known welding material "thermite," with the addition of sulphur; and although, as already stated, quite non-explosive, its combustion temperature is so intense that the consequences of an ignition may, in certain circumstances, be as serious as those following an explosion. It is noteworthy that in both these accidents the material which ignited contained aluminium as one of its ingredients, and that, although under test these compositions are by no means super-sensitive, accidents with them have been somewhat frequent. Having regard to the very high temperature of combustion, there is nothing surprising in the rapidity with which the fire spreads, but the reasons for the primary ignition, which is apparently due on occasion to very slight causes, are extremely obscure.

In February, 1918, a fire occurred at Messrs. Nobel's factory at Ardeer in connection with a solvent recovery plant, and this was followed on March 6 by a somewhat similar accident at Messrs. Curtis's and Harvey's works at Cliffe, one life being lost in each case. In the case of the Cliffe accident, the fire spread almost instantaneously to no less than 103 cordite drying compartments in two ranges some 30 yards apart. These accidents emphasise the special risks attaching to recovery plants owing to the presence of inflammable vapour and point to the necessity of installing efficient flashtraps in every main and branch pipe liable to contain inflammable vapour.

In the conveyance of explosives, no accident of any kind came to notice.

The number of accidents under the heading "Use and Miscellaneous" is 233, as compared with 293 in 1917 and 274 in 1916. By these accidents 27 persons were killed and 256 injured, as compared with 40 and 309 in 1917. Of these accidents, 85 were due to gunpowder, causing eight deaths

and injuries to 88 other persons, and 66 were due to gelignite, causing 12 deaths and injuring 61 others. Detonators were responsible for 27 accidents, 13 of which were due to playing with these dangerous articles.

From August 4, 1914, to November 11, 1918, the aggregate number of accidents occurring during the manufacture of all classes of explosives, was 1,277, involving the loss of 325 lives and injuries to 1,316 persons. In the following table are given particulars of a number of classes of explosives, together with the number of casualties and the approximate quantity of each class of explosive produced in the period mentioned. The remaining accidents arose out of the manufacture of ammunition, fireworks, etc.

Class of Explosive.	Nature of Explosive.	Quantity Produced.	No. of Accidents.	No. of Persons.	
				Killed.	Injured.
Class 1.....	Gunpowder	1 tons.			
" 2.....	Nitrate mixtures.....	66,094	61	7	19
" 3.....	Ballistite and cordite (including pastes)	7,552	5	-	3
	Picric acid, tri-nitro-toluol and other coal-tar derivatives	181,712	98	35	50
	Other nitro-compounds	107,713	69	177	368
" 4.....	Chlorate mixtures	62,048	79	31	91
" 5.....	Fulminates	440	17	2	15

Two fatal accidents due to the explosion of so-called empty drums which had contained petroleum were reported during the year. In one case the drum had but recently been emptied, but in the other steps had been taken to remove all trace of petroleum by thoroughly washing out and rinsing the drum. The victim of the explosion, an experienced chemist, then put a light to the bung-hole, either to prove that no inflammable vapour remained, or to burn out the residue, and a violent explosion followed. This accident is one more indication of the difficulty of rendering safe a vessel which has contained petroleum spirit, owing (1) to the density of the vapour, which is about two and a half times as heavy as air, and (2) to the very small proportion of vapour required to make an explosive mixture with air.

ANALYSIS OF ANTIMONY SALTS.

THE oldest methods of determining the amount of free sulphur in antimony pentasulphide depended upon the extraction of it by carbon disulphide, using a Soxhlet's apparatus, and it has recently been found that the pentasulphide is practically unattacked in the cold, and even on warming only about 0.4 per cent. is reduced. Benzene or acetone can be used as solvent, but if benzene is used the pentasulphide must previously be thoroughly dried. Acetone is not to be recommended, for it dissolves a small quantity of the sulphide in addition to the free sulphur. Another method of determining the impurities depends upon the fact that antimony pentasulphide is completely soluble in warm ammonia, and the other substances present can be filtered off and determined in the usual way. To estimate the total sulphur the sulphide can be dissolved in a solution of pure potash and then subjected to the action of chlorine, when all the sulphur is transformed into sulphuric acid and the antimony into antimonic acid. Fuming nitric acid can also be used to convert the sulphide into sulphate, which can be estimated as barium sulphate in the usual way, and hydrogen peroxide acts similarly. If the sulphide is dissolved in pure sodium sulphide the percentage of antimony present can be determined by electrolysis, platinum electrodes being employed; but this process cannot be recommended, for the values obtained are always too high. By treating a solution of the sulphide with soda and hydrogen peroxide and adding alcohol, a precipitate of sodium antimonate is obtained after thirty-six hours' standing. From the weight of this precipitate the amount of antimony present can be deduced. In an alternative process the antimony is determined as tetroxide, Sb₂O₄. A given weight of the sulphide is heated over a water-bath with hydrochloric and nitric acids. The solution is evaporated to dryness, taken up with hydrochloric acid, diluted, and filtered. The precipitate consists of silica and calcium sulphate. The antimony is contained in the filtrate, which is decomposed by HCl and oxidised to give Sb₂O₄.—*Revue des Prod. Chem.*

CELLULOSE ACETATE CONTRACTS.

REPORT OF COMMITTEE OF INQUIRY.

THE British Cellulose Inquiry Committee, composed of Lords Sumner, Inchcape, and Colwyn, appointed "to inquire into and report upon the formation and financial arrangements of the British Cellulose and Chemical Manufacturing Company, Ltd., and associated companies and upon their relations with Departments of the Government" have now issued their report. It is explained that the delay in issuing the report is due to the fact that it was not until the end of July that the committee secured the attendance of Dr. Camille Dreyfus.

The nominal share capital with which the company was first registered was £4,000., divided into 160,000 shares of 6d. each. Subsequently the parent company was registered as a private company on March 20, 1918, with a nominal capital of £3,500,000., divided into £1. shares, and allotted as follows:—To two shareholders subscribing the memorandum of association of the company and to the shareholders in the existing company at the rate of £14. 10s. per 6d. share, less fractions, 2,319,998 to the Explosives Syndicate in respect of £355,000. cash found by it, and of £100,000. additional cash provided by Nobels 780,000.

Value of the Company's Shares.

After dealing in detail with the formation of the company and the financial arrangements and associated companies, the report says:—

What the parent company's shares are really worth is a matter of complete uncertainty. Neither of the companies has ever had its shares quoted on any Stock Exchange. There were during 1917 and 1918 a number of dealings in the 6d. shares at prices ranging from £1. to as much as £10. 10s. per share. We have investigated the transactions chiefly in order to see whether they contained any ground for suspecting that persons, whose influence might be supposed to be useful to the company, were being illicitly propitiated, or that the persons who put such value on the shares did so because they believed that the company would have the benefit of such illicit influence. We have failed to discover any grounds for such suspicions. Again, and for a similar purpose, we thought it right to press for a specific explanation of the fact that the company's shares were of so small a denomination as sixpence, and to inquire why sixpence was pitched upon in preference to any other amount. In fact, there seems to have been a change from an earlier plan for shilling shares, and the adoption of a capitalisation on a sixpenny basis was as sudden as it is unexplained. The answer to our questions was always the same—namely, that this denomination of shares was selected for the purpose of "defining the interests," but this explains nothing, for it must always be so. To us the matter remains unexplained, though not, we think, inexplicable, but its relevance for the purpose of our inquiry appears to be confined to the two points mentioned.

If there are persons who have reason to complain of representations made to them, or of the way in which they were induced to acquire their shares, or to part with their interests, they have their ordinary legal remedies, and the matter does not concern us. We have been unable to discover any evidence that the capitalisation of either company was used to procure undue influence for the company, or that the company, in fact, enjoyed the benefit of any undue influence thereby, nor do we think that any material inference can be drawn from the great contrast between the nominal amounts of these shares or between the nominal amount of the original shares and the prices at which they were dealt in.

Sources of Supply.

At the outbreak of the war the use of cellulose acetate in the manufacture of "dope" was not widely known. After the outbreak of war, however, its value was more fully realised, and with the increasing growth in the aeronautical programme the question of supply became important. There were three well-known sources of supply—namely, the Bayer Company of Germany, the Usines du Rhône of France, and the Cellonite Company (Dreyfus and Co.) of Basle, Switzerland, of which the Bayer Company was obviously not available to this country, whilst France would naturally have the first call on the output of the Usines du Rhône.

The first connection of the Swiss firm with the War Office dates from September, 1914, when their agent in England offered supplies. This was followed by a period of investigation by Mr. A. E. Turner, the officer then in charge of the Aero-

nautical Contract Branch of the War Office, who ultimately in July, 1915, issued a form of tender for 100 tons of cellulose acetate of British manufacture to three firms, including that of Dr. Camille Dreyfus. These three firms were the only concerns with which up to that time Mr. Turner had come in contact, except Cellon, Ltd., which had passed on certain tentative proposals for manufacture by two Frenchmen resident in Germany at the outbreak of the war, whom the French Government employed on their return to France after disposing of their German patent rights. Dr. Camille Dreyfus alone returned the tender, accompanying it with a letter, in which he made certain stipulations, and reserved the right to deliver 50 per cent. of the total quantity from Switzerland at a reduced price. This being the only tender, it was accepted.

The company, having been registered in March, 1916, ultimately secured a site for its factory, and after a period during which plans of the proposed factory were prepared, commenced its erection in August, 1916. In the following October, negotiations were undertaken by the company for a supply contract, and on January 26, 1917, after samples of its products had been obtained, and the Inspection Department had reported that from this material "dope" of good quality and (given uniformity) economical in solvent could be made, the company secured its first direct contract. This was for the supply of 40 tons of cellulose acetate, deliveries to be up to one ton per day, commencing when the factory was ready. By this time the aeronautical programme of the British Government and of the Allies had undergone very large expansion, with the result that it had become urgently necessary to safeguard future supplies. In the following April the company began deliveries of cellulose acetate under its January contract, at first on a small scale, but subsequently in considerable and increasing quantities.

Further anxiety was caused in the Department by the anticipation of a shortage of acetone, a very important solvent used in the manufacture of "dope" from cellulose acetate. The company also appears to have anticipated difficulty in obtaining solvents, the main ingredient of which is acetic acid. In April, 1917, the company put before the Ministry proposals for the manufacture of methyl acetate, as an alternative solvent for acetone, and at the same time expressed its willingness, if supported with priorities and sufficiently large contracts, to lay down plant for the production of synthetic acetic acid, which would involve the erection of carbide and electric power plant. At this date there appears to have been some doubt in the minds of the officials whether acetone or methyl acetate would be the more suitable solvent, and, accordingly, when a contract was made on June 6, 1917, for 2,500 tons of solvents, it provided for the supply of definite quantities of methyl acetate and acetone, the balance in both to be in the Government's option, and it stipulated that the Inspection Department was to be satisfied of the suitability of the material for the manufacture of "dope." When this contract was obtained, the proposed experiments in the manufacture of acetic acid were abandoned, and the Explosives Syndicate was committed to an expenditure of £300,000. on the full scheme.

In May, 1917, the company's original cellulose acetate unit appears to have been almost completed. In that month the company pointed out that with deliveries of one ton per day, the forty tons contract would last for a little over a month, and pressed for a new contract for 300 tons, and on June 6, 1917, it obtained a contract for twenty-five tons a month, terminable on notice and at a slight reduction in price, as compared with the previous cellulose acetate contract.

Increasing Output.

For some time past the outlook in regard to the supply of cellulose acetate had been critical, and in order to meet the "dope" requirements, recourse was had to supplies of acetate which had previously been rejected. Hitherto, apart from the comparatively small quantities provided by the factory at Spondon, the Aircraft Department had been obtaining its supplies partly from the Basle Company, and partly through the British Aviation Commission in Paris from the Usines du Rhône. The quantities obtainable from this latter source were always limited, and in June, 1917, broke down altogether in consequence of the increased demand of the French Government. The still further expansion of the aeronautical programme in this country increased the difficulties of the position.

To cope with this situation the Aircraft Department secured in July, 1917, the assistance of Brig.-General William Alexander, and appointed him Director of Supply. The whole

range of supply was divided into sections, and the section dealing with "dope" chemicals was assigned to Mr. John Radcliffe. Having ascertained that the Usines du Rhône could not be relied upon for his requirements, General Alexander summoned the directors of the company to a conference, at which they answered his complaints of their slow progress by the explanation that they were unable to obtain necessary materials. He thereupon informed the company that he would have their works inspected to ascertain the facts, and that if he found that they were unable to deliver the supplies required, he would obtain them by means of a Government factory. Mr. Radcliffe was sent to inspect, and his report was considered on August 16, 1917, at a conference attended by Lord Weir, General Cormack, General Alexander, Mr. A. E. Turner, and Mr. Radcliffe. This conference also considered the aeroplane programme, which was to be almost doubled by the following January and trebled by the following June, and after Mr. Radcliffe had explained that the company had arranged to enlarge its plant to meet the increased programme, Lord Weir gave instructions that the work was to be proceeded with and that all necessary priorities were to be given.

Between the dates of these two conferences the company had applied to the Contract Officer, Mr. Turner, for a loan of £200,000. on the proposed power plant, and had pressed for an additional contract for cellulose acetate commensurate with the proposed extensions, explaining that these, when completed, would give a daily output of four tons. Mr. Turner referred this matter to General Alexander, who informed him of the decision arrived at by the second conference to sanction the scheme for an ultimate daily output of four tons of cellulose acetate, including the power and carbide units, and left with him the question of a further contract. In the result a loan of £200,000. on the power plant was authorised and was duly made, and a contract was given to the company for a further 700 tons of cellulose acetate. Up to June, 1918, this loan of £200,000. represented the only public funds, other than payments for supplies, which had been received by the company, and of this £200,000. over £35,000. had by June 30, 1918, been recovered in accordance with the agreed terms for securing the loan.

Every effort to secure the needed output from the Spondon works was made by General Alexander and his staff, who, in addition to obtaining the assistance of the Lands Branch to secure the land desired by the company, intervened with the Trench Warfare Department to obtain the necessary supplies of acetic acid, supported the company's application for building licences, and appointed officials to report on the progress of the company's works, with a view to assisting it with priority and to securing provision of labour, etc.

The entry of the United States into the war had placed a further strain on the Supply Department, for, apart from the British requirements, which were increased, it was proposed that American machines should be "doped" in this country. The company was informed of these additional demands, and writing on December 20, 1917, to Sir Arthur Duckham, then Director-General of Aircraft Production, stated that arrangements were being made for the ultimate supply of cellulose acetate at the rate of eight tons per day. The company applied for fresh contracts for the supply of cellulose acetate and methyl acetate on a scale commensurate with the proposed additional extensions, and these contracts were the subject of negotiations between the company on the one hand and the Supply and Contracts Departments on the other, but were never completed, for reasons which will hereafter appear. No deliveries of methyl acetate had up to this time been made under the contract of June 6, 1917.

Revised Financial Arrangements.

The company in the beginning of 1918, during the negotiations for the new contracts, put forward a claim for increased prices in consequence of the increased cost of labour and of acetic acid and other ingredients. It desired an advance of 50 per cent. on the original contract prices for cellulose acetate, and a similar price under the proposed new contracts, but, as the Ministry declined to accept this figure, matters came to a practical impasse. A conference was held on April 13, which considered the history of the company and its position in relation to the Ministry, and arrived at the conclusion that, having regard to the proposed extensions and the difficulties about contract prices, it was desirable that the original financial concession of November, 1916, should be cancelled. Accordingly a Committee of Officials was appointed to negotiate with the company. Meetings took place between the Ministry officials and certain directors of the company, with the result that new terms were ultimately agreed upon, and after

investigation were sanctioned by the Treasury. These terms were embodied in heads of agreement dated June 27, 1918, which provided for the cancellation of the financial concession and of all the existing supply contracts, for the abandonment by the company of all claims for increased cost of wages and material under the cancelled contracts, and for fresh supply contracts on the basis of periodical average cost, plus a fixed profit and a proportion, after the first six months, of any saving in cost, fixed rates of depreciation on building and plant being allowed for the purpose of ascertaining the average cost. By this agreement the Ministry undertook to make loans to the company against its expenditure on electric plant, and also to lend a fixed percentage of the company's approved war capital expenditure on buildings and other plant up to the end of 1918, such loan to bear interest at 1 per cent. above bank rate, with a minimum of 5 per cent. per annum, to be repayable within five years from the date of the agreement. Pursuant to these provisions, the Ministry had, up to the date of our appointment, advanced the sum of £485,000., and up to October, 1918, the sum of £900,000.

Undoubtedly, after the contract of July, 1915, was placed, the War Office was anxious to ensure the manufacture of cellulose acetate in this country, and relied on somewhat sanguine anticipations expressed by Dr. Dreyfus, which, however, were not realised. As previously stated, the factory was commenced in August, 1916, but the first deliveries under the company's initial contract of 1917 only took place in April, 1917, and then at first only on a small scale. The excuse put forward to us on behalf of the company was the difficulty in obtaining the necessary material, and some support is lent to this explanation by the fact that deliveries began in the third month after official assistance was provided for the company. Considerable delay was also experienced in prosecuting the extensions consequent on the increased supply contracts, and this may to a large extent be accounted for by the difficulty the company found in securing the necessary labour and materials, a difficulty due to war conditions and by no means uncommon.

British Firms Offer to Manufacture.

A considerable part of our inquiry related to complaints made in the interest of the British chemical trade that, instead of having recourse to British manufacturers, or at least giving them an opportunity of sharing in the supply of the desired British product, the Department favoured foreign chemists, entrusted to them the exclusive supply of cellulose acetate, and disregarded the fact that there were numerous objections taken both to the quality of their product and the great delay in the fulfilment of their promises. At the outset we think it right to observe that such complaints appear to us to be natural under the circumstances.

We have received the statements of the British manufacturers with sympathy and have examined them with care, but it seems to us that at the bottom of the whole question lies the dominant fact that an adequate supply of cellulose acetate for war purposes under new and urgent conditions had at all costs to be assured. The responsibility for the course pursued was at its height when General Alexander took charge in the middle of 1917, and we examined him closely as to his reasons for adopting the course chosen. We feel bound to say that he frankly recognised the weight of the comments made and met them from his own point of view with equal frankness. The matter stood thus:—

Down to the summer of 1917, the Government demand for supplies of cellulose acetate had increased, and the opportunity of satisfying that demand from established sources of supply had diminished. The company had disappointed the anticipations formed as to the date when it would begin its British manufacture. It was to manufacture not only with a process of foreign origin, but to a considerable extent for the benefit of foreign interests. The Messrs. Dreyfus themselves, as well as the process, had attracted opposition, and it was quite certain that British chemical manufacturers would claim, and would powerfully support their claim, to be just as capable of manufacturing a commercial cellulose acetate as any foreign chemist, and would expect to have their share of this new trade. To select a moment when the Government programme was to be largely increased as the moment at which to close the door to British enterprise and to invest the company, in spite of its shortcomings and its connections, with a position so favoured as to amount almost to a monopoly, was a decision of such gravity, and the risks involved were so obvious, that the officials responsible for taking such a course could not possibly shut their eyes to the criticism which they must incur, or fail to weigh the arguments for it very care-

fully. When those arguments come to be examined they are undoubtedly weighty.

Reasons for Rejection.

Between a general, and even a practical, knowledge of the manufacture of such a chemical product and the experience and special knowledge which are needed if it is to be turned out in considerable quantities with reasonable uniformity and with a regularity that can be relied upon, there is a considerable difference. That British chemical manufacturers could have overcome the difficulties and have attained the necessary skill and experience in no very long time we need not and do not doubt, but to the time so required there had to be added the further time requisite for equipping the necessary plant on a sufficient scale in the middle of the war. Experience showed that in the case of this kind of plant, as of so many others, that further time would be long. The policy of the Government generally was to discourage the duplication of plant or the erection of anything that was not strictly necessary. The inquiries made by the Department showed that no chemical concern possessed a plant in being which could have been utilised more rapidly for the production of any considerable quantity of cellulose acetate, and, although several were confident that they could have reached the manufacturing stage quickly, there was only too much risk that they might be disappointed. Several factories were inspected, and we have taken evidence as to the results of the inspection. The responsible officials came to the conclusion that, if contracts were placed with new manufacturers, there would be much delay in obtaining deliveries, and we are satisfied that they had materials before them from which such an opinion might reasonably be formed, nor have we sufficient grounds for holding that opinion to have been wrong. Another point, in respect of which the course pursued by the Department has been open to criticism, is that the Government was made exclusively dependent for its supplies of acetate upon a company of whose prior production complaints had been made, and that no provision was made for a spare or emergency source of supply of cellulose acetate. This point, again, was too obvious to be overlooked, and in fact it was weighed with care. There had been great delay and much disappointment connected with the completion of the company's Spondon works. There has been complaints of the cellulose acetate delivered, and some of it had been rejected. There were officials connected with the Department's Technical Branch whose attitude towards the whole Dreyfus scheme, personnel, process, and product was adverse, not to say hostile.

There is, however, less in all this than might appear at first sight. Since July, 1915, the Government had been more or less committed to the Dreyfus product. Whatever objections had been taken to it when supplied from Switzerland, we were told that the cellulose acetate made at Spondon was favourably reported upon and proved to be satisfactory. In some cases of objections taken, the evidence suggests serious doubt whether they were justified at all. The delays in getting the Spondon factory to work had come to an end, and from the middle of 1917 onwards supplies came forward regularly and in increasing quantities. The works themselves were inspected and reported on as being well designed and laid out, and equipped with all precautions against destructive accidents, and accordingly the risks incident to the decision to draw the whole supply from one place of manufacture were reduced to a minimum. In addition to the objections to erecting fresh works and plant at all, it was by no means clear that persons who had had no manufacturing experience of the process would be able to work it successfully, and extension of the existing works presented advantages as against resort to a new source of supply. No ill effect appears to have resulted from the policy adopted, and we recognise that the situation was one in which some risk had to be faced, however the Department might decide.

Again, it was a natural result of this policy that the concern which succeeded in getting the position of sole supplier of cellulose acetate during the war would in fact obtain a highly favoured position after the war. It received priorities and other assistance, which enabled it to construct a large and well-equipped factory at a time when other chemical manufacturers could not do the like. It gained experience and trained a staff ready, on the return of peace, to take up the manufacture on a commercial scale, and we are given to understand that the future of cellulose acetate is, to say the least of it, promising, for its uses are many and the start thus obtained over other competitors was of real and perhaps of

great value. This advantage lends itself readily to a charge of favouritism, and if there were any ground for believing that the officials who adopted a policy involving such a result were not disinterested or were lacking in good faith, we should feel that they had a very serious case to answer.

Of the subsequent offers to manufacture, the majority did not, in the circumstances, appear to merit very serious attention; but two exceptions may be specifically noticed, namely, those of the United Alkali Company and Courtaulds, Limited. The first United Alkali Company offer was made to the Admiralty in about May, 1916, in the shape of a tentative proposal to manufacture under the du Rhône process, if a promise of contracts were made. It was communicated by the Admiralty to Mr. Turner; but as the latter had already arranged with Dr. Dreyfus for all requirements of his Department then anticipated, and was given to understand that early deliveries from the company might be expected, he felt himself unable to guarantee to the United Alkali Company any orders, and left it to the Admiralty to give them such encouragement as it thought fit. The United Alkali Company was at this time prepared to co-operate with Dr. Dreyfus, but negotiations came to nothing.

A further proposal was made by the United Alkali Company to the Admiralty in October, 1916, in which the company asked for a minimum guarantee of one hundred tons per annum for five years, subject to "write-off" and depreciation allowances during the war, but the proposals struck Mr. Turner as being so extensive that, if accepted, they would mean the closing down of the Cellulose Company's works, and the substitution of the United Alkali Company, which was not then manufacturing, had not yet definitely secured the right to use the proposed process, and admitted that it would probably take six to nine months for the erection of the plant. This seems to have been a reasonable view.

Subsequent proposals were made by the British Enamellite Company in conjunction with the United Alkali Company to manufacture under the same process, and these came before General Alexander and were declined, on the ground that investigation was being made into the possibility of making cellulose acetate at a Government factory, and that if the Department decided to adopt this process, they would dispense with intermediaries. Lord Weir, who was then Controller of Supplies, was advised accordingly.

The offer of Courtaulds Limited appears to have been invited by an official in the Technical Department, who held strong views as to the unsuitability of the Cellulose Company's product. The interview between the Technical Officer and the company's representative took place on October 26, 1917, and on October 29 the latter wrote intimating his directors' willingness to entertain the matter. On November 5 the papers were passed to General Alexander's immediate subordinate officer, who in a minute dated the following day declined the proposals, in view of the very large increase of plant which would be needed, and of the arrangements already made. In the course of a few days the proposal was referred back through the Chief Officer of the Technical Department and the Director of Aircraft Equipment to the Supply Department, when General Alexander confirmed his subordinate's decision, and remarked on the large amount of capital expenditure, machinery, plant and labour involved, to all of which, unless absolutely essential, the Munitions Works Board took exception. Early in October, 1917, Lord Weir had instructed General Alexander not to consider further extensions without reference to him, and shortly afterwards formal instructions were communicated to Heads of Supply Departments that, in view of the growing difficulty in connection with building, and the supply of labour and materials, and the serious shortage of steel, no further extensions should be undertaken unless vitally urgent in the national interest. This was some months before the proposed deliveries could have been made in any case.

No Preferential Treatment.

We are of opinion that nothing amounting to favouritism of the company has been shown by the Aircraft Department. It is, undoubtedly, the fact, as has been shown above, that from the commencement Dr. Dreyfus, and subsequently the company, received support and assistance from Government officials, and became, in fact, the sole source to which the Service looked for supplies, but we think that the reasons for this are adequate. In this connection it is worthy of comment that, notwithstanding the transfer of the Aeronautical Department from the War Office to the Ministry of Munitions, and the subsequent change of official personnel, the same

policy was adopted, namely, to develop to the utmost capacity the resources of the company's works.

In conclusion, we will refer to the criticisms made upon the Company last year, which were the origin of the present inquiry. Whether or not the Sub-Committee on the Ministry of Munitions, which was appointed by the Select Committee on National Expenditure, directed its attention to the supply of cellulose acetate simply in the course of its own investigations, or in consequence of any special representations made to it, we do not know; but, after the publication of the Select Committee's Fifth Report, it is plain that criticism was particularly attracted to the two facts, that the company had received much official support, including loans of public money, priorities, contracts and an Excess Profits Duty concession on the one hand, and on the other, that its sixpenny shares appeared to be assumed to have become quickly worth £14 10s. each. Hence a connection between these facts was strongly suggested, which alike involved the personal credit of the managers of the company's affairs and of the Departmental officials concerned. The contrast between the nominal capital of the original company and that of the parent company is indeed so glaring that, for much of the criticism to which they have been exposed, we think that the promoters and others connected with the company's financial arrangements have only themselves to thank. In other respects, however, less than justice has been done them. If all the facts, which we have sifted with so negative a result, had been available last year to the critics of the company and its proceedings, we think that their conclusions would, to say the least, have undergone large modification. It is satisfactory to be able to report that, in our opinion, there has been neither favouritism nor corruption, and that the official action taken has been throughout such as appeared to the Departments concerned the best that was open to them under the circumstances.

DETERGENT ACTION OF SOAP.

THE detergent action of soap, according to S. U. Pickering (*Chemical Society Transactions*), must be attributed partly to its power of emulsifying oil, the globules of which become coated with a pellicle which prevents them from rendering adjacent objects oily; partly to the low surface tension between the soap solution and the oil, and possibly in part to the acid soap produced in the hydrolysis forming a colloidal compound with the dirt. The experiments cited show, however, that the main factor is that soap will dissolve oils, including paraffin oil, forming soluble compounds, some of which contain approximately equal proportions of oil and soap. In order to prevent the emulsification of a portion of the oil, the globules of which then become coated with a pellicle which prevents further combination with the soap, it is necessary to have a considerable excess of oil, if the soap is to combine with the maximum quantity of oil. The addition of water in excess does not decompose the oil-soap compound, but preliminary dilution of the soap solution causes more oil to be emulsified, with the result that a much smaller proportion combines with the soap.

In the incorporation of oil with soaps three stages may be observed. For example, in the case of potassium stearate paste and benzene, the paste first becomes thickened owing to the oil being incorporated to form a coarse sort of emulsion; then the mixture becomes limpid owing to the formation of a soluble compound between the oil and the solid stearate; and, thirdly, this liquid rapidly solidifies to an opaque stiff mass owing to the globules of oil, through combination with the stearate, becoming sufficiently reduced in size to form a true emulsion. The extent to which these stages occur depends on factors such as the proportion of emulsion formed, the viscosity of the reagents, etc.

The proportions of oil and soap which will unite depend both on the chemical and on the physical character of the reagents. For example, in the case of three samples of purified paraffin oils, the volumes dissolved of the oil boiling at 257° C. were intermediate between the volumes dissolved of the oils boiling at 98° C. and 198° C. respectively. Changes of temperature take place during the combination of the soap and oil, the nature and extent of the change depending upon the character of the oil. It is probable that the combination is invariably exothermic in character, but that the heat absorbed in the fusion of the solid stearate or semi-solid soap usually more than counterbalances the heat evolved. Naph-

thalene dissolves to a limited extent in soap, but partly separates out in crystalline form on cooling or diluting the solution. Soap will dissolve less paraffin oil in the presence of naphthalene.

GERMAN POTASH INDUSTRY.

THE NEW REGIME.

THE preliminary or constituent assembly of the German "Imperial" Potash Board was held in July, and was followed by the first business meeting at the beginning of August. It is to the Potash Board, erected under the law for the socialisation of the potash industry, that the control of the future destinies of the industry has been entrusted. The board is composed of 30 members (with an equivalent number of deputy members), representing the interests of producers, merchants, the Potash Syndicate, the potash miners and officials, agriculturists and the potash products' manufacturing branch, together with a Government official. The representatives of the employers and the workmen combined form a majority of the board, so that their joint decisions can override, if thought necessary or advisable, all the other departments embodied in the board. Herr D. Richter, Under-Secretary of State and president of the Potash Syndicate, has been elected chairman of the Potash Board, with vice-chairman in the person of Herr Sachse, miners' leader and president of the old Social Democratic Miners' Union. As a first result of the establishment of the board the inland prices for potash have been increased by 50 per cent. as compared with the higher prices which were originally fixed under the Socialisation Bill, the increase being prompted by the very unfavourable financial situation of the industry.

The Potash Syndicate, in anticipation of the assumption of activity by the Potash Board, forwarded to the latter in July a petition setting forth in detail the unsatisfactory position of the industry, and to that petition is due the higher prices which were brought into operation on August 1. Quoting from the petition it is first mentioned that the prices authorised by the law for the regulation of the potash industry of April 24, 1919, would by no means correspond to the growing costs of production. The Syndicate calculated in March that the extra expenditure of a normal potash works amounted to £50,000 per annum, without taking into consideration the decline in the workmen's efficiency and the new demands put forward at that time by the officials for higher wages. Between November 1, 1918, and March 31, 1919, the potash works in operation, exclusive of those in Lorraine, experienced a total loss of £2,286,000, against which could be set profits of a few works amounting to £93,000; the net loss of £2,200,000 in round figures was equivalent to an average loss of £21,600 per works, and no improvement has taken place since that time. Dealing with working expenses in the matter of materials, it is shown that the price of lignite rose from 110 marks per 10 tons on January 1, 1919, to 223 marks on April 2, 1919; and explosives increased by 41 per cent. in the same period, whilst the efficiency of the miners in, for instance, the district of Halle fell from an average of 122 tons of crude salts in the first quarter of 1918 to 34 tons in the first three months of the present year. This statement is now confirmed by the Halle State Mining Administration.

The turnover made by the Potash Syndicate in the first half of 1919 amounted to 380,000 tons of K₂O, and the total for the whole year is estimated at 800,000 tons, of which 200,000 tons will represent exports. It is estimated that the increase in prices by 50 per cent, which has been sanctioned, will just cover the additional working expenses, without making any change in the situation of those works which are being operated at a loss. It is unofficially stated that large profits on export business, which in peace times contributed so largely to the prosperity of the potash industry, cannot be reckoned with in the near future, particularly in the case of the United States, where the dear native product seems to be preferred to the German article. It is thought too that the quantity of potash which the Americans finally will require, will be procured from the Alsatian mines, so that the prospects for Germany appear to be by no means favourable at present.

LODERS AND NUCOLINE, LTD.—A final dividend on cumulative preference shares at rate of 6 per cent. per annum for half-year to August 31, less income tax.

PARLIAMENTARY NEWS.

Import Restrictions on Chemicals.

In the House of Commons Mr. Raffan asked the President of the Board of Trade whether the licensing Sub-committee (Dyes Department) of the Import Restrictions Department has the power, before granting permission for the importation of medicinal chemicals said to come within their province, to demand the name of the actual manufacturers as well as that of the consignors and to demand the original invoice and to levy a charge of 1 per cent. on the said invoice, estimated at the rate of exchange at the time of granting permission to import?

Mr. Bridgeman: Chemicals of kinds which are intermediate materials for the manufacture of dyestuffs can be imported only under licence and must be consigned to the Central Importing Agency, which is entitled to levy a charge of 1 per cent. to meet expenses incurred. This arrangement has been made by the licensing Sub-committee of the Trade and Licensing Committee equally representative of dye-makers and dye-users established under the Government scheme for the encouragement of the dye-making industry, and has met with the general approval of all the interests concerned. The name of the actual manufacturer is necessary in order to prevent the indirect importation of German dyes and materials, and the invoice value for the purpose of calculating the agency fee. Chemicals suitable only for medicinal purposes are not included within the scope of the arrangement. The Licensing Sub-Committee of the Dyes Department is distinct from the Import Restrictions Department. No fees are charged by the latter.

Mr. Raffan asked whether the Department of Import Restrictions is asking why the requirements of chemical firms for such chemicals as diethyl barbituric acid, methyl sulphonal, and santoinine cannot be satisfied in this country, notwithstanding the fact that these chemicals are not manufactured in Great Britain to any appreciable extent?

Mr. Bridgeman: No inquiry as to the chemicals named can at present be traced, but it is a usual matter of routine to inquire of applicants for licences whether their wants cannot be satisfied from home sources. When it is agreed that chemicals which are needed are not manufactured in this country to any appreciable extent licences to import them are freely issued.

Mr. Raffan asked whether the Licensing Sub-committee (Dyes Department) of the Import Restrictions Department has the power, under Proclamation No. 29, to prohibit the importation of such chemicals as antipyrin, amidopyrin, and phenacetin, notwithstanding the fact that these chemicals are used entirely for medicinal purposes, and are not in any sense intermediary dye products?

Mr. Bridgeman: The three products named are undoubtedly intermediate coal tar products, but for the reason stated in the question the duty of issuing licences for them has, by interdepartmental arrangement, been transferred from the licensing sub-committee of the Dyes Department to the Department of Import Restrictions.

Mr. Raffan asked whether the importation of vanillin into this country has been entirely prohibited in spite of the fact that the entire output of British manufacturers has been sold up to the end of September; and whether the effect of this prohibition has been to increase the market price of vanillin from 45s. to 80s. per pound?

Mr. Bridgeman: The importation of vanillin is not prohibited entirely; it is restricted to 50 per cent. of 1915 imports. I am not prepared to accept the suggestion in the later part of the question.

Muriate of Potash.

Mr. John Dennis on Monday asked the President of the Board of Trade (1) whether a licence to import 200 tons of muriate of potash has been applied for by the West Norfolk Farmers' Manure Company, Limited, a farmers' co-operative association; whether such licence has been refused, the applicant being referred to the British Potash Company; whether any valid reason exists for the restriction of trade liberty in the importation of this fertiliser; and whether, in the event of the applicant being forced to buy from the rival concern named, he will undertake that the cost of this fertiliser in King's Lynn to the applicant shall not exceed its contract price with the Alsace-Lorraine Trading Company for the 200 tons in question; (2) the Parliamentary Secretary to the Board of Agriculture whether he is aware that muriate of potash is required

for the manufacture of compound root manures; whether the West Norfolk Farmers' Manure Company, Limited, whose output is 20,000 tons of manure per annum, is not permitted to import muriates for their manufacture; whether, in order to get the required production for next year's crop, its manufacture must be at once proceeded with; and whether any shortage in production must have a detrimental effect on the 1920 crops of potatoes and other roots; (3) The Minister of Labour whether he is aware that the West Norfolk Farmers' Manure Company, Limited, of King's Lynn, is unable to employ its plant and men owing to its inability to obtain a licence to import muriate of potash already contracted for and now awaiting shipment at Rotterdam; whether its works are on the point of being closed down in consequence, entailing a large number of men being thrown out of employment; and whether he can take any steps to avert this calamity?

Sir A. Geddes: The application from the company was dated August 11, and has not yet been replied to. The requirements of the company will be filled by the British Potash Company, who hold a licence for the higher grade of potash salt referred to. The Alsace-Lorraine Trading Company do not import the higher grade salts, and if the West Norfolk Farmers' Manure Company, Limited, have contracted to buy an import-prohibited article they should have first assured themselves that a licence would be issued. At the same time, it is probable that the muriate, which will arrive in the course of the next day or two, will be delivered at a price at least as favourable as that at which it could be obtained from the Alsace Company. That price will be the f.a.s. price at Rotterdam, as fixed by international agreement, plus incidental expenses.

Mr. Dennis: Will the price added to the f.a.s. price Rotterdam be the freight price direct Rotterdam to King's Lynn, or will it be freight Rotterdam to London plus freight from London? Cannot it be imported direct to King's Lynn?

Sir A. Geddes: I should require notice of that before answering with absolute certainty, but I know of no reason why it should not be brought direct to King's Lynn.

Queensferry Government Factory.

Mr. Kellaway, replying to Mr. Rose, said: The capital expended on the building and equipment of H.M. Explosive Factory, Queensferry, has been £4,150,000. The amount expended in wages, including the payment of the supervisory staff, has been approximately £1,673,000. The average number of employees from 1915 to 1918 was, approximately, 2,500 men and 2,500 women, though 4,000 men were employed while the factory was under construction. The value of the total production of the factory is estimated at £19,800,000., and at £33,000,000. at American contract prices. The future of the factory is still under consideration.

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

British Coalite Company, Ltd.—Meeting of creditors 62, London Wall, E.C. (August 20.)

Coalite, Ltd.—Meeting of creditors 62, London Wall, E.C. (August 20.)

Grays Chemical Works, Ltd., London, E.C.—H. V. Thurgood, 11, Queen Victoria Street, E.C., F.C.A., appointed receiver July 25.

Spanish Copper Company, Ltd.—Resolved July 16, confirmed August 6: That the company be wound up. H. R. Yglesias, 6, Old Jewry, E.C., liquidator. Meeting of creditors at liquidators, August 21.

DISSOLUTIONS OF PARTNERSHIP.

(Note.—When two dates are given in the following announcements, the first is the date of the dissolution. The date in parentheses is that of the official advertisement.)

Single Rose China Clay Company (Wm. Jas. Adams and Jno. Stephens, as trustees of Rchd. Frdk. Stephens, deceased; Wm. Jno. Kelly, Wm. Martin, Thos. Martin, Hart Nicholls, sen., Hart Nicholls, jun., as trustees of Tom Nicholls, deceased; and Arthur Maunder Richards, as nominee and agent of Rchd. Richards and Sons), St. Austell, China clay merchants. July 1. Debts will be received and paid by H. N. Wright, St. Austell, solicitor, liquidator of the firm. (August 8.)

CRYSTALLOLUMINESCENCE AND TRIBOLUMINESCENCE.

WHEN a solution of potassium sulphate in water is evaporated until crystals begin to form and is then poured off into another vessel and cooled slowly without agitation, flashes of bluish light are seen to shoot through the liquid while it turns into a mass of crystals. More striking still is the phenomenon when arsenic acid is dissolved in hydrochloric acid, and the solution is placed in a freezing mixture at $-50^{\circ}\text{C}.$; as soon as sparks appear, the crystals fall out rapidly. Another way of performing such experiments is to add hydrochloric acid to a solution of sodium chloride; the precipitation of the salt is associated with a luminescence. This is known as crystalloluminescence, and is not a rare phenomenon; it is shown by the bromide and iodide of potassium, e.g., not by the same sodium salts, however. Triboluminescence is the luminescence observed when crystals are crushed or split and is fairly common. In this latter case the suggestion, made in 1820 by Henrich, that the sparking is due to frictional electricity, seems very plausible. But there are other explanatory suggestions. Schneider rubbing diamonds together found no connection between frictional electricity and tribo-electricity; W. J. Pope could not establish any connection of triboluminescence with pyro-electricity; others considered the phenomena as thermal or chemical; Trautz observed that freshly-prepared crystals lose their triboluminescence with age. The suggestion of chemi-luminescence has recently found an advocate in Professor Harry B. Weiser, of Houston, Texas (*Journal of Physical Chemistry*).

Weiser points out that amorphous as well as crystallised substances may be triboluminescent, and that the disturbed crystal symmetry of some scientists is not essential to the phenomena; that may be, but the argument would not disprove the electric character of triboluminescence. Weiser, however, considers with Bancroft crystalloluminescence as a special case of triboluminescence and both due to chemical action. In his opinion the two phenomena, which are usually associated, go together with conditions favouring a high concentration of ions in excess of the equilibrium ionisation; most luminescent substances are also dissociated in these solutions. The addition of a colloid like gelatine diminishes the luminescences, not because it increases the viscosity, but, he argues, because it interferes with the dissociation; cane sugar has little effect on the luminescence, though it also increases the viscosity. Weiser supports this argument by novel spectroscopic observations. The light emitted is too faint for direct spectrometry. By passing the faint light through various colour filters, he ascertains, however, that in the case of the arsenic experiment mentioned above, the light emitted contains neither red nor yellow and very little green, being essentially blue; the same colour he observes in triboluminescent arsenic acid, and when burning arsenic in oxygen or when feeding arsenic compounds into coal gas or hydrogen flames. He made similar colour observations with potassium sulphate. These experiments are certainly interesting, but they can hardly be said to afford much support to the hypothesis that the tribo and crystalloluminescences are due to chemical action, and to the recombination, rather than to the decomposition, of the atoms. Ionisation may play an important part; but so far as we are aware, says *Engineering*, attempts to prove that liberation of electricity accompanies chemical combination have not been successful, and something like that seems to be involved in Weiser's suggestion.

GOVERNMENT DEPARTMENT AND CHEMICAL MANURES.

A White Paper issued on Tuesday by the Board of Agriculture and Fisheries, dealing with the financial results of the principal trading schemes carried out by the Food Production Department, shows that on these schemes there was a net loss of £1,080,529.

On a total expenditure of £91,942, for superphosphate purchased during the season 1917 there was a loss of £28,759. This transaction was undertaken early in 1917, when there was a serious shortage of superphosphate. It may be noted that the expenses are given as not far short of half the value of the superphosphate. It was recognised at the time that loss on the transaction was unavoidable, but the net loss was

considerably heavier than anticipated, owing to rates of freight being finally fixed by the Minister of Shipping at a much higher figure than was originally allowed for. Out of the 18 schemes embarked upon by the Department, 12 show a loss amounting to £1,086,325., five show a profit of £5,796., and one, that for nitrate of soda, balanced. The largest profit was on muriate of potash which for the year ended March 31, 1919, gave a margin of £4,016. income in excess of expenditure.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W.1, whence unless otherwise stated further information may be obtained:—

Australia.

H.M. Senior Trade Commissioner in Australia has forwarded copies of the specification, conditions of contract, and tender form in connection with a call for tenders by the Victoria Railway Commissioners for the supply and delivery of sodium acetate (commercial). (Contract No. 32,485.) Sealed tenders, on the proper forms, will be received by the Victorian Railway Commissioners, Spencer Street, Melbourne, up to 11 a.m. on October 29. Samples of the sodium acetate offered must be deposited with the Chief Storekeeper, at Room 109, Railway Offices, Spencer Street, Melbourne, at or before the time of the receipt of tenders. Tenders must be accompanied by a preliminary deposit of $\frac{1}{2}$ per cent. of the total amount of tender. Local representation is necessary. The above-mentioned copies of the specification, etc., may be consulted by manufacturers of sodium acetate at the Inquiry Room of the Department of Overseas Trade, 73, Basinghall Street, London, E.C.2. It will be observed that the time for tenders is limited, and this intimation will therefore be of use only to firms having agents in Australia who can be instructed by cable.

H.M. Senior Trade Commissioner in Australia reports a recent call for tenders by the Deputy Postmaster-General, Melbourne, for the supply and delivery of sulphate of copper (a) in store, (b) in bond. Schedule No. 1,578. Tenders closed on August 5, but in view of possible future requirements, particulars of this contract may be of interest to United Kingdom manufacturers of sulphate of copper, and copies of the specification, etc., may be inspected at the Inquiry Office, Department of Overseas Trade, 73, Basinghall Street, London, E.C. 2.

British India.

A firm in Madras are desirous of accepting agencies, to cover the Madras Presidency and Southern India for motor oils and greases.

British West Indies.

An import merchant at Port of Spain, Trinidad, with business connections extending to the Leeward and Windward Islands, the Barbadoes and British Guiana, wishes to represent United Kingdom suppliers of drugs, chemicals, and soap. (Reference No. 375.)

Egypt.

An agent in Alexandria desires to represent manufacturers of chemical products, and oil paints. (Reference No. 383.)

South Africa

An inquirer in South Africa, with experience of the petroleum trade, desires to represent British firms in that market. (Reference No. 387.)

France.

An important French company, who deal in chemicals, offer to place their services at the disposal of United Kingdom manufacturers. (Reference No. 391.)

Poland.

A representative at Warsaw desires to get into touch with first-class United Kingdom firms dealing in tanning materials. (Reference No. 399.)

Scandinavia.

A sole agency is required by an important organisation in Scandinavia, for large United Kingdom manufacturers of soda ash. References, etc., can be exchanged and full details given to interested firms. (Reference No. 400.)

Spain.

A French merchant in Madrid desires to secure agencies for British manufacturers of chemical products. (Reference No. 351.)

A firm in Madrid desire to secure agencies for United Kingdom manufacturers of chemical products. (Reference No. 352.)

ITEMS OF INTEREST.

GLASSWORKERS' WAGES.—The British Flint Glass Manufacturers' Association have granted a further advance of 10s. per week to glassworkers.

PERSONAL.—Captain J. R. Starkey, M.P., has been appointed on the Committee of Management of the British Sugar Beet Growers' Society, to represent the Nottinghamshire Agricultural Executive Committee.

ASBESTOS WORKERS' STRIKE.—Some 400 workers have come out on strike at the Cape Asbestos Company's works at Barkington, pending a satisfactory reply to their demands, pressed by the National Union of General Workers, for a 48-hour week, a week's holiday with pay, and an increase of 5s. per week for women employees.

NEW ISSUE.—The Reliance Fuel Company has been formed to carry on the manufacture of briquettes and smokeless fuel under a special process, with 365,000 7½ per cent. (free of tax) cumulative participating preference shares of £1. each and 200,000 deferred shares of 1s. each, of which the £1. participating preference shares have this week been offered for subscription at par.

NEW RUBBER WORKS.—Messrs. Potter's Asbestos Co., Ltd., Littleborough, announce their intention to erect a rubber works which will give employment to 1,000 people. They have notified the Littleborough District Council of the project, and the Council have decided to expedite their housing scheme in order to provide accommodation for the people who will come into the district.

ITALIAN IMPORT PROHIBITIONS.—The importation of the following goods into Italy is prohibited with the exception of those destined direct to State Departments or to the Consortia for Supplies: Sulphite, bisulphite, and metabisulphite of calcium, potash and sodium; acetone; perfumery and perfumed soap; sulphur; essences and essential oils; sulphate of copper; and explosives.

GUN-COTTON EXPLOSION.—A verdict of "Accidental death" was returned at an adjourned inquest at Plymouth on Tuesday concerning a gun-cotton explosion at the Royal Naval Ordnance Depot, Bull Point, Devonport, on August 6, as a result of which two men lost their lives and another was seriously injured. The evidence showed that deceased were engaged in removing detonators from depth charges landed from a steamship.

ZINC AND ZINC-DUST PRICES.—The quotation for Australian high-grade zinc dust, 88-92 per cent. metallic zinc purity, remains at £70. per ton, f.o.b. Inquiries have been fairly numerous, and the recent briskness of the market is maintained. The price of Australian electrolytic zinc, containing 99.95 per cent. metallic zinc, is unchanged at £42. per ton, f.o.b. Australia, for direct shipment to New Zealand, India, South Africa, and the Far East.

FUEL ECONOMY.—At the autumn meeting of the Iron and Steel Institute, which will be held at the Institution of Civil Engineers, Great George-street, Westminster, on September 18 and 19, there will be a conference on fuel economy, at which Dr. W. A. Bone, Sir Robert Hadfield, and Mr. A. Hutchinson will present on behalf of the British Association Fuel Economy Committee a report on fuel economy in steel works, and Mr. H. J. Yates, one on fuel economy in foundry practice. Messrs. Cosmo Johns and L. Ennis will also contribute a paper on fuel economy in German iron and steel works, and in addition there will be a number of papers on technical questions relating to steel manufacture.

FUTURE OF PATENTS BILL.—Now that the Patents and Designs Bill has been postponed consideration by the House of Lords until after the recess, there is reason, says the London correspondent of the *Birmingham Post*, for believing that those commercial organisations which are desirous of taking action regarding amendments to the measure will agree as to the final form in which they will ask the Government to frame the operative clauses. The Birmingham Chamber of Commerce at present is content with urging that the Bill should extend the period of existing patents which have not been fully worked during the war for a period of two years from the date of legislation. The London Chamber seeks to have the whole period of the war added to the life of the patent. The Newcastle-on-Tyne Chamber is desirous of stimulating invention in this country to an extent not possible with the present heavy cost of patents here.

BRITISH MOTOR SPIRIT SYNDICATE.—The company issued a circular to the shareholders, which states that negotiations have been concluded with Mr. H. C. Pierce, of the Pierce Oil Corporation, one of America's leading oil companies, whereby Mr. Pierce or his Corporation are to become majority subscribers for cash of the Syndicate's capital of £250,000, and will supply a minimum of 12,000,000 gals. of petrol per annum, for which the Syndicate will act as distributing agents.

SCOTTISH OIL COMPANIES.—It was officially announced on Wednesday at Glasgow that the Anglo-Persian Oil Company have intimated to the directors of the Scottish oil companies that as all but a small proportion of the shareholders have accepted, they are prepared to implement the terms of their offer of July 11, and that the necessary steps are being taken to register the new company to be formed to acquire the shares of the various companies. The offer of the Anglo-Persian Company (in which the British Government have a controlling interest) was to purchase the Ordinary shares of the Scottish oil companies.

UNEMPLOYMENT INSURANCE.—The Ministry of Health wish to direct the attention of employers and others to the fact that by the National Health Insurance Act, 1919, which has just received the Royal Assent, the limit of remuneration up to which persons employed otherwise than by way of manual labour are liable to compulsory health insurance has been raised from £160. to £250. a year. Employers are accordingly required for the future to pay health insurance contributions in respect of persons employed by them under a contract of service as follows:—For non-manual workers, where the rate of remuneration (including any regular bonus, etc.) does not exceed £250. a year; for manual workers, irrespective of the rate of remuneration. A non-manual worker whose remuneration is over £160. a year but not over £250. a year may, within a limited period and under certain conditions, claim a certificate of exemption, and on the grant of such a certificate the employer's contribution (3d. a week) is alone payable. Forms of application for exemption will be obtainable shortly at any Post Office.

BUSINESS NOTICES.—Messrs. Edgar Allen and Co., Ltd., Imperial Steelworks, Sheffield, have issued the first number of the "Edgar Allen News." The publishers state that while the prime reason for its publication is a desire to sell their products, they are, at the same time, endeavouring to give their customers technical and practical information about steel and steel goods.—We are informed that the entire share capital of Messrs. Huntington, Heberlein and Co., Ltd., mechanical, chemical, and metallurgical engineers, has been acquired by Messrs. Henry Gardner and Co., Ltd. The business premises of the former will in consequence be transferred to the registered offices of Henry Gardner and Co., Ltd., at 2, Metal Exchange Buildings, E.C. 3. The board of Messrs. Huntington, Heberlein and Co., Ltd., will consist of Mr. Walter Gardner (chairman and managing director), Mr. H. C. Bingham, Mr. H. J. Bush, and Mr. R. H. Bingham.—The Compagnie Commerciale du Nord has been transformed into a limited company with a capital of 1,000,000 francs, and with registered head office at 21, rue Kipdorp, Antwerp. The new company will continue, as in the past, the exportation and importation of merchandise in general, and chemicals, drugs, and associated products in particular. The London and Paris branches will be carried on as before.

IMPORTS INTO ITALY.—In a letter to *Reuter's* agency regarding the Italian decree of July 24 abolishing all previous restrictions on imports into Italy and instituting a new list of goods for which import licences are necessary, the Italian Commercial Attaché in London writes as follows: "From reports and articles appearing in the Press in regard to the present import restrictions in Italy, I notice that the decree in question has been, to a certain extent, misunderstood, being considered as a prohibitionist measure. On the contrary, the decree re-establishes the principle of freedom of importation, confining the restrictions to certain classes of goods specified in the new lists, whilst, prior to its publication, a license was necessary for any class of goods. I may further add that the goods, which are included in the list of restrictions, are not entirely prohibited—in fact, no license is necessary when they are destined directly for the Consorzi di Approvvigionamenti (Syndicates for Supplies) and State Departments, and licenses may also be granted to private firms. It is a temporary measure, with the purpose of regulating supplies and alleviating the exchange difficulties, and I have authority from my Government to give assurance that any desire which the British may express will receive sympathetic consideration."

DRUG AND CHEMICAL WORKERS' CLAIM FOR HIGHER WAGES.—The dispute between the Amalgamated Society of Pharmacists, Drug and Chemical Workers, and the Master Pharmacists remains unsettled. A scheme was formulated, but it has now been rejected by the men's union. The matters in dispute, which include improvements in wages and hours, will be submitted to arbitration.

AMERICAN F.O.B. SHIPMENTS.—On account of the misunderstandings that have arisen in the past, the definition of the formula "f.o.b." as applied to shipments from the United States of America, has been discussed by the Melbourne Chamber of Commerce. In view of the various meanings read into the term by American exporters, it was felt that something should be done, and ultimately it was decided to suggest to Australian importers that in American contracts they should distinctly state f.o.b. overseas vessels at New York, San Francisco, or as the case may be. Where the port of shipment is left open it is recommended that the contract should run f.o.b. overseas vessel. This, it is felt, should place the meaning of the term beyond doubt.

TECHNICAL ASSOCIATIONS FEDERATION.—A natural corollary to the recent growth of professional associations operating as registered trade unions is the formation of federations of such associations. One such federation has been formed in the Federation of Technical and Scientific Associations, in which are included the National Union of Scientific Workers, the National Association of Industrial Chemists, the Electricity Supply Commercial Association, and the Electrical Power Engineers' Association. The immediate object of the Federation is to secure the recognition of the claims of the executive, administrative, and supervisory grades of the various industries, and to secure united action on matters of general interest affecting these grades. In our advertisement columns will be found particulars of a meeting of the Federation, which eligible associations are invited to attend.

AMERICAN RESTRICTIONS ON IMPORTS OF CHEMICALS.—As amended by a ruling of July 14, General Import Licence PBF No. 37 authorises the importation into the United States from all countries of the world, except Hungary and those parts of Russia under the control of the Bolshevik authorities, of all commodities except those specified below: The following commodities, the importation of which continues to be controlled by reason of existing agreements: Pig tin, and all metal alloys containing tin, including tin drosses, tin oxides, solder drosses, type metals, antifriction metals, waste metals and other metals containing tin, except tinplate and tinplate scrap. Salvarsan, neosalvarsan, arsphenamine, and all substitutes therefor and equivalents thereof. The following commodities, the control of the importation of which by individual import licences is desirable: (a) Dyes and dyestuffs, including dye bases, crudes and intermediates; (b) potash; (c) all drugs and chemicals (except nitrate of soda). It should be noted that the foregoing paragraph, as now amended, provides that hereafter individual import licences will be required for all importations of drugs and chemicals (except nitrate of soda) from every source whatsoever. All applications for licences to import dyes or dyestuffs, including dye bases, crudes and intermediates, must be accompanied by supplemental information sheets giving complete specifications of the character of the dyes or dyestuffs proposed to be imported. American consuls abroad have been instructed to issue certificates of non-enemy origin before certifying invoices covering shipments of potash, dyes or dyestuffs, or drugs or chemicals intended for importation into the United States.

NITROGEN PRODUCTS COMMITTEE.

IT is understood that one reason for the delay in the publication of the report of the Nitrogen Products Committee is the amount of work that has been necessary in the preparation of an index. This is believed to be now nearly complete. The issue of the report is awaiting a definite instruction from the Minister of Munitions. A representative of the *Times* was informed on Wednesday that the report, which is dated May last, deals at length with the project for installing a plant in Great Britain for the fixation of nitrogen from the atmosphere, and that it views as feasible the Haber process. The utilisation of water power for the purpose does not take a prominent place in the recommendations. The report is a final and not an interim one, but it is believed that it contemplates the resumption of investigations into both catalytic fixation and the use of nitrogen products in industry generally.

REPORTS OF COMPANIES.

Ammonia Soda Company, Ltd.

After deducting £9,300. (as against £500.) for the reserve for excess profits duty and nearly £8,000. (in contrast with £7,000.) for depreciation, the accounts for the year to January 31 show an available balance of £35,000., in contrast with £32,305. Twelve months ago the preference dividend was paid for three years, clearing off the arrears, and £5,000. was written off suspense account, reducing it to £15,000. It is now proposed to pay the six per cent. preference dividend, less tax, for the past year, to write off the balance of the suspense account, and to carry forward £15,000., against £10,261. The report states that since the war, in consequence of the heavily increased costs, the decline in demand and market price, and the bad state of the machinery, making manufacture impracticable, work was stopped in March, and to prevent dissipation of assets the voluntary liquidation of the company is now proposed.

United Premier Oil and Cake Company, Ltd.

Statutory report states that the following is an abstract of the receipts and payments to August 7:—Receipts.—Cash received in respect of 376,438 7 per cent. cumulative preference shares, £372,716.; in respect of £400,000. 6 per cent. debenture stock, £383,356.; sundry dividends, £832.; sundry receipts, £49.; total, £756,954. Payments.—On account of purchase consideration, £682,653.; investment, £1,758.; interest on purchase consideration, £17,346.; underwriting commission and brokerage, £38,701.; sundry expenses, £12.; cash at bankers, £16,482. The preliminary expenses, other than underwriting commission and brokerage shown above, were estimated at £25,000, and have been borne by the vendors.

J. and J. Cunningham, Ltd.

The report for the year to June 30 states that the directors have increased the nominal capital to £500,000. by the issue of 10,000 new ordinary shares of £10. each, paid from reserves. The balance of profit, including brought in, amounts to £31,789., and, after paying preference dividend to December 31, 1918, and interim dividend on the ordinary shares and settling £27,000. to reserve, there remains a disposable balance of £44,289. The directors allocate £4,500. for preference dividend to June 30, £16,500. in payment of a further dividend (free of tax) on the ordinary shares, which now amount to £220,000., and in carrying forward £23,287.

DIVIDENDS.

AEERTHAW AND BRISTOL CHANNEL PORTLAND CEMENT COMPANY, LTD.—Interim dividend for the past half-year at the rate of 10 per cent. per annum, free of income tax.

ELECTRO BLEACH AND BY-PRODUCTS COMPANY, LTD.—Interim dividend of $3\frac{1}{2}$ per cent. on the preference shares.

BRADFORD DYERS ASSOCIATION, LTD.—Dividend on ordinary shares for half-year to June 30 last at the rate of 7 per cent. per annum.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

THE fact that though Cumberland and North Lancashire hematite pig-iron makers are now in the market to sell their production to the end of the year they have not advanced prices is an indication that the demand for iron is abating somewhat, and that even if requirements are sufficient to enable them to maintain their 26 furnaces in blast the volume of business will not be quite so torrential in character as between April and July. There is not, however, any apprehension entertained that events will compel any reduction in output, and that being so the by-product coke oven industry should be able to remain working at two-thirds of its capacity for the rest of the year. Whether activity in coking can grow any greater depends largely upon the state of the steel rail trade. There is a steady proportion of low phosphorus brands of iron, and East Coast supplies of coke to the Furness district are maintained at 15,200 tons, and to East Cumberland at over 9,000 tons per week. The make of by-products is a trifle smaller this week. Benzole and sulphate of ammonia alone are being fully absorbed; creosote depends to some extent upon new tonnage; pitch is firmer since it began to be exported; and naphthalene is dull. A portion of the chemical works' plant is idle.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Spanish Fertiliser Trade.—The movement in Spanish fertilisers is rather peculiar. Both in 1918 and 1919, taking the first four months of the respective years, there was practically no business whatever in superphosphate or Thomas ash and other mineral fertilisers. On the other hand, there is an enormous relative increase in the importation of nitrate of soda. Thus the importations for January-April inclusive, 1918, made only 8,213 tons, but the corresponding figures for this year make 41,978 tons.

Russian Fertilisers.—The Russian Soviet Government are painfully conscious of the lack of manures for the fields and have undertaken a careful inquiry into the requirements on the one hand and the possibilities of satisfying the soil on the other, and have concluded that Russia can neither provide the requisite fertilisers from her own resources nor from the outside within a reasonable time, owing largely to the lack of transport facilities as far as outside supplies are concerned. However, it is stated that they have sent a deputation to the Skoda Works to become acquainted with the Meiner process for producing synthetic nitrogen.

Sulphate of Ammonia.—A substantial drop in coal production occasioned by the recent coal strike has been noted with regret by users of sulphate of ammonia, as it certainly means a temporary reduction in the make of that important fertiliser. Probably the export trade will feel it most of all, and in these days when the foreign exchanges are so heavily against us anything that tends to lower exports is indubitably bad. Financial and business connections at present can ill-afford even a setback of this sort, and the opinion is widely expressed that nothing must happen now to interfere with the manufacture of fertilisers here. Further news from America mentions that there is no difficulty in obtaining what supplies of sulphate of ammonia are needed on the Pacific coast. The situation there is satisfactory and no special activity is expected until after August.

Potash.—Cheap potash manures are reported to be unobtainable in this country although supplies of dearer sorts are offered. Sulphate of potash in particular is declared to be an extremely restricted trade, the price making its application unprofitable for all ordinary crops. With regard to the American potash situation, the market is stagnant at present. The domestic producers in the United States certainly fear unrestricted imports of German potash. If these are allowed, they say, American producers will be forced to abandon their plants and cut their losses. With competition wiped out and the German potash monopoly re-established, Germany will charge for her potash all the traffic will bear and the American potash men are making the most of the propaganda based upon this. It is not held on the other side that the competition of the French-owned Alsatian deposits will force German profits to a reasonable figure. This may happen, say the experts, in years to come, but not yet.

Basic Slag.—This material is in particular request, especially, apparently, the 22 per cent. material at £3. 10s. 0d. per ton. Fears are expressed that the season's production will not be sufficient to satisfy all the agricultural customers who are pressing their orders. Higher prices are looked forward to as likely and it is contended that farmers will pay any moderate advance without resentment in view of the favourable position of their own industry.

Other Fertilisers.—Bone meals have a fair sale. Some pure steamed bone meal is offered at £13. per ton, but East Indian is still very scarce. Large arrivals are promised from India from time to time but they do not mature. Bristol quotes some bone meal at £15. 10s. 0d. per ton. For indifferent qualities as little as £9. has been asked. Dried blood is in short supply with prices firmly held. Shipment figures are given as high as 30s. per unit for ammonia and 2s. 6d. for phosphate. Tankage values are also increasing. For shipment 27s. 6d. per unit for ammonia and 2s. 6d. for phosphate is quoted. Fish meal is in good demand at similar prices. Some supplies of high quality fish guano at £18. per ton are also notified. A new company with a nominal capital of £40,000. has been formed to carry on amongst other vocations, the manufacture of fertilisers in Oxfordshire.

LEGAL INTELLIGENCE.**Bankruptcy Examination.**

At the London Bankruptcy Court on Tuesday last, the public examination was held of Richard Maloney, of 11, Aberdeen Park, Highbury, N. The statement of affairs filed by the debtor showed gross liabilities amounting to £5,293. 15s. 9d. of which £1,468. 15s. 9d. was due to unsecured creditors, and £3,825. to partly secured creditors. The assets amounted to £71., thus leaving a deficiency of £5,222. The Receiving Order was made on July 2, on the petition of creditors, the act of bankruptcy being the failure of the debtor to comply with the requirements of a bankruptcy notice.

In reply to questions put by the Official Receiver debtor stated he was a solicitor by profession, but in March, 1917, he became interested in certain secret processes for the manufacture of glaze and enamel, and in December of that year he agreed to purchase a two-fifths interest in the process for £4,000. The £4,000. was payable as to £3,000. in cash and the balance in fully paid shares in a company which it was proposed to form to acquire one of the processes with a nominal capital of £100,000. He actually paid £2,350. mainly with borrowed money. No company was floated, and he had latterly been employed by another London solicitor at a remuneration of four guineas per week. He attributed his insolvency to loss in connection with the secret processes the value of which he alleged was misrepresented, and to his liabilities for damages and costs in a libel action brought against him in November last. According to his deficiency account he had lost £5,040. in connection with the secret processes, which included £2,425. advanced by other persons. The terms under which he received the money were that he was to assign a portion of his interest in the processes to the lenders, so there was some question as to whether he was liable for those loans. If the company had been successful he would have received £40,000. in shares, and those who had lent him money would have received a substantial bonus. He had never failed before or made any arrangement with his creditors.

The examination was ordered to be closed.

SOUTH WALES NOTES.

(SPECIALLY CONTRIBUTED.)

The outputs of tinplates at the majority of factories operating are very satisfactory and show a slight increase on previous weeks. With cooler weather this improvement should be maintained. Export business is improving and manufacturers are now better able to make quotations for extended deliveries.

Much attention is being paid to the patent fuel business and investigations are taking place with a view to utilising the anthracite coals that abound in South Wales and which have hitherto only been used in small quantities in the manufacture of briquettes. Plant for properly preparing anthracite coal for the purpose is to be put down at several centres. The exports of patent fuel have been very good and it is believed that foreign business can be largely increased. The number of cargoes that have left Swansea—the chief centre of the trade—is much above the average, the principal destinations being St. Nazaire, St. Malo, St. Valery, Buenos Ayres, Havre, Antwerp, Genoa, Dieppe, and Rotterdam.

The demand for coke is much stronger and the ovens with their by-product plants are working well.

Sulphuric acid makers are active and the call for the acid is good. A cargo of 2,070 tons of iron pyrites arrived at Newport for Messrs. Chance and Hunt Ltd.

The progress made in the Clogau gold mines, Bontddu, has been satisfactory and the vein of gold discovered a few days ago is turning out better than was anticipated. Great developments are likely to take place and further miners have been engaged.

Basic slag is in good request. There have been several cargoes sent to Devonshire during the last few days.

FIRE.—Damage estimated at £30,000. was caused by a fire which occurred at Cox's Glue Works, Edinburgh, on Monday. The fire occurred during the dinner-hour, and as a result of it 150 employees will be thrown out of work for a time.

IMPORTS OF CHEMICALS AND ALLIED PRODUCTS.

NEW COMPANIES.

Simplex Construction Company, Ltd.—Registered August 2. Capital £120,000., in 200,000 ordinary shares of 10s. each and 400,000 deferred shares of 1s. each. Objects: To enter into an agreement with J. Thame, the Chemical Engineering Corporation, Ltd., and O. R. Mounsey, and to carry on the business of contractors, builders, civil, electrical, constructional, mechanical, chemical, mining, and general engineers, etc. Registered office: Parliament Mansions, Victoria Street, S.W.

Western Development Company, Ltd.—Capital £25,000., 5s. shares. Object: To treat and deal in lead, zinc, copper, silver and other ores, metals and mineral substances, etc. Registered office: Broad Street House, Old Broad Street, E.C.

Antoine Chiris, Ltd.—Private company. Capital £20,000., £1. shares. Perfumers, soap makers, etc. Office: 3, Draper's Gardens, E.C.

Baltic Wharf Chemicals, Ltd.—Private company. Capital £15,000., £1. shares. Object: To acquire from the East Stratford Works, Ltd., the benefit of certain existing inventions in relation to improvements in the manufacture of permanganates, etc. The directors are to be appointed as follows: One by the East Stratford Works, Ltd., one by the Saccharin Corporation, Ltd., and one by Spencer, Chapman and Messel, Ltd. Office: 36, Mark Lane, E.C.

Chas. Orme and Co., Ltd.—Private company. Capital £16,000., £1. shares. Drysalers, manufacturers of and dealers in polishes, paints, driers, colours, oil, varnishes, distempers, etc. Solicitors: Venn and Woodcock, 14, South Square, Grays Inn, W.C.

Colmans, Ltd.—Private company. Capital £2,000., £1. shares. Chemists, druggists, drysalers, oil and colourmen, etc. Registered office: 9, Brunswick Street, Cheetham, Manchester.

Eastern Counties Bone Products Company, Ltd.—Private company. Capital £20,000., £1. shares. Directors: A. G. Shirling-Rooke and W. T. Powling. Registered office: Duxford Works, Duxford, Cambs.

Hemingway's Chemical Processes Company, Ltd.—Private company. Capital £30,000., £1. shares (25,000 6 per cent. non-cumulative preference). Objects: To carry on the business of colour, paint, and varnish manufacturers at Marsh Gate Lane, Stratford; also to carry on the business of chemical and insecticide manufacturers, copper makers, tin and other metal recoverers, metallurgists, electric depositors, etc. Qualn £500. Registered office: 15, Seething Lane, E.C.

John Peak and Co., Ltd.—Private company. Capital £30,000., £1. shares. Object: To take over the business carried on by J. Peak and H. Peak at Bridgewater Chemical Works, Wigan, as "John Peak and Co." Registered office: Soho Street, Newtown, Wigan.

London Polish Company, Ltd.—Private company. Capital £5,000., £1. shares (4,800 ordinary and 200 management). Office: 104, Great Russell Street, W.C.

Philippe Lentendu and Co., Ltd.—Private company. Capital £800., £1. shares. Manufacturers of and dealers in drugs, chemicals and anatomical, orthopaedic and surgical instruments, etc. Registered office: 3-4, Chichester Chambers, Chichester Rents, Chancery Lane, W.C.

Poli-varn, Ltd.—Private company. Capital £4,000., £1. shares (1,500 preference). Object: To take over the business of manufacturers of and dealers in "Poli-varn" boot, furniture, and linoleum polishes, "Scourine," "Scouto," metal polish, soap pastes, and other preparations. Registered office: Rear of 46, John's Hill Grove, Battersea, S.W. 11.

Printers' Bronze Powder Company, Ltd.—Private company. Capital £10,000., in 5,000 6 per cent. cumulative preference shares of £1. each and 100,000 ordinary shares of 1s. each. Solicitors: James Turner and Sons, Dunedin House, Basinghall Avenue, E.C.

Sulphus Chemical Company, Ltd.—Private company. Capital £5,000., £1. shares. Object: To acquire from T. B. Greenwood the benefit of certain inventions in relation to the "Sulphus" ammoniated wool scours, soap and disinfectants, chemical manures and soda ash, etc. Office: Manor Works, Eccleshill, Bradford.

A. Macaulay and Co., Ltd.—Private company. Capital £6,000., £1. shares. Object: To acquire and take over the business of A. Macaulay and Co., metal merchants and refiners, Moorpack Smelting Works, Renfrew.

(Advs. continued from page v.)

Plant, Apparatus, and Materials For Sale.—continued.

HORIZONTAL Air Compressor, Ingersoll-Sergeant, duty 342 c.f. of free air per minute at 100lb. pressure; also Horizontal Belt-driven Compressor, 12in. x 24in., with fly-wheel and outer bearing.—Harry H. Gardam and Co., Limited, Staines.

WOODEN Vessels of every description, New or Second-hand; all shapes, dimensions, and capacities. We have on hand the largest stock in England, and firms requiring anything in this direction are kindly invited to write for particulars, etc., to Henry Roberts and Co., Vat and Back Makers, Atlantic Wharf, Stratford, London, E.

PLANT and Machinery of every description in stock at our works and for immediate delivery, including Boilers, Steam, Gas, and Oil Engines, Generating Sets, Dynamos, Motors, Pumps, Tanks, etc.; and firms requiring plant at once should address their inquiries to Harry H. Gardam and Co., Ltd., Engineers, Staines. Telephone: Staines 98.

THREE Cochrane Vertical Boilers, 11ft 3in. x 5ft. diameter, 150lb. working pressure; brand new as delivered from makers, and for immediate delivery.—Harry H. Gardam and Co., Ltd., Staines.

HORIZONTAL belt-driven Vacuum Pump, cylinder 18in. x 18in. stroke; fast and loose pulleys, 5ft. diameter; done little work.—Box "F.C.C.," Chemical Trade Journal Office, 265, Strand, London, W.C. 2.

TWO Horizontal Mixers, by Christy and Norris, 7ft. 6in. long, 8ft. 9in. deep, by 4ft. 6in. wide, constructed of jin. steel plate, with heavy mixing gears, fitted fast and loose pulleys, 34in. by 6in. face; almost new.—Box "E.V." Chemical Trade Journal Office, 265, Strand, London, W.C. 2.

Plant, Apparatus, and Materials For Sale.—continued.

STEAM-DRIVEN Centrifugal, by Manlove, Alliott, 54in. basket; also small 26in. belt-driven Centrifugal.—Box No. "8,178," Chemical Trade Journal Office, 265, Strand, London, W.C. 2.

TWO Oil Engine-driven Compressor Sets, each comprising a 33B.H.P. Campbell Vertical Engine, coupled to Broome and Wade Air Compressor, 100c.f. at 500lb. pressure, with complete set of spares for engines and compressors in each case; brand new, as delivered from makers; exceptional opportunity, as these sets are available for immediate delivery, and will be offered below actual cost; full particulars on request.—Harry H. Gardam and Co., Ltd., Staines.

CARRAGHEEN (IRISH) MOSS.—Stocks always on hand in English warehouses.—Samples and particulars from J. W. Cumming and Sons, Clonliffe, Dublin. Telegrams: "Cumming, Dublin."

Miscellaneous.

GRINDING of every description of Chemical and other materials for the trade, with improved mills.—Thos. Hill-Jones, Ltd., "Invicta" Mills, Bow Common Lane, London, E. Telegrams: "Medikaster, London." Telephone: 3653 East.

WORRIED !

THE following extracts from a letter alleged by the *San Francisco and Pacific Druggist* to have been addressed to a revenue collector would appear to indicate that even across the Atlantic, life has its little ups and downs.

"I have been held up, held down, sand bagged, walked on, sat on, flattened out and squeezed, first by the United States Government for the federal war tax, the excess profits tax, the Liberty Loan bonds, for the state, county and city highway tax, and the auto tax and the syntax and by every society and organisation that inventive mind of man can invest to extract what you may or may not possess; from the Society of John the Baptist, the G.A.R., the Woman's Relief, the Men's Relief, the Stomach Relief, the Navy League, the League of Nations, the Red Cross, the Iron Cross, the Double Cross and every other cross of all colours until I feel that I am cross myself, and the Y.M.C.A., the Y.W.C.A., the Old Folk's Home, the Children's Home, the Orphan Society and every hospital in town.

"The Government has so governed my business that I don't know who runs it. I am inspected, suspected, examined and re-examined, informed, required and commanded so I don't know who I am, where I am or why I am here.

"All I know is that I am supposed to be an inexhaustible supply of money for every human need, desire, or hope of the human race; and because I will not sell all I have and go out and beg, borrow, or steal money to give away I have been cursed, discussed, talked to, talked about, lied to, lied about, held up, hung up, robbed, and nearly ruined; and the only reason I am clinging to life is to see what in h— is coming next!"

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

The specifications of the following applications are not printed by the Patent Office until the complete specifications have been accepted.

August 11th to 16th (inclusive).

Removing Amatol from Shells, etc., for Recovering the Ammonium Nitrate. Arnot, J. W.; and Beakbane, C. F. 19,969.
Recovery of Valuable Products from Gases Evolved in Destructive Distillation of Coal, Shale, etc. Bury, E.; and Skinningrove Iron Company. 20,157.
Alkaloids. Chemische Fabrik vorm. Sandoz. 20,223.
Artificial Silk. Clayton, J. 19,802.
Electrolyte for Deposition of Iron. Coles, S. O. Cowper-. 20,096.
Treatment of Pitch Materials, etc. Craig, T. J. I.; Hood, J. J.; and Spence and Sons, P. 20,153.
Lubricating-oil Purifying and Reclaiming Systems. De Laval Separator Company. 19,904.
Treatment of Emulsions, etc. Edser, E.; and Minerals Separation, Ltd. 19,797.
Purification of Benzole, etc. Evans, E. V.; Hollings, H.; and South Metropolitan Gas Company. 20,217.
Kilns for Pyrites. Fairrie, J. L. 19,978.
Production of Urea or Ammonia from Cyanamide. Giertsen, S. 20,021.
Fermentative Preparations. Groll, M. 19,830.
Mixture of Nitrogen and Hydrogen. Hanna, G. F.; and Major, J. L. 20,124.
Electrolytic Tinning, and Electrolytic Fluid for Same. Harbeck, E. 20,216.
Composition for Coating Iron, Steel, and Wood. Holzappel, A. C.; and Walther, P. 20,174.
Lubricants, Anti-scouring Agents, etc. Hood, J. J.; Spence, H.; and Spence and Sons, P. 20,152.
Nitration of Oils. Howsa, G. H. 20,192.
Aluminium Tinning and Soldering. Laird, W. B. Johnson-. 19,984.
Conversion of Heavy Hydrocarbons into Lighter Hydrocarbons. Lamplough, F.; and Synthol, Ltd. 20,132.
Nitrogen Products. Lundén, H. L. R.; and Thorsell, C. T. 20,042.
Utilisation of a Waste Sulphite of Soda and of its Derivatives in Manufacture of Soaps. Morel, J. 19,901.
Converting Paraffin into Acids. Pardubitzer Fabrik der Akt.-Ges. für Mineralöl-Industrie vorm. D. Fanto and Co. 19,822, 19,823, 19,921, and 20,023.
Oxidising Paraffin to Acids. Pardubitzer Fabrik der Akt.-Ges. für Mineralöl-Industrie vorm. D. Fanto and Co. 19,824.
Treatment of Ores by Flotation. Partington, J. W.; Taylor, M. T.; and Vivian, G. T. 19,715.
Removal of Sulphur from Gases. Rambush, N. E. 19,702.
Classifying and Concentrating Apparatus for Minerals, etc. Richardson, W. W. 19,734.
Aluminium Solders. Soc. Anon. des Laminiers et Cablerie. 19,750.
Distillation of Heavy Hydrocarbons. Steinschneider, L. 20,022.
Extraction of Fatty and Oily Matters from Wet Sludges. Stephens, A. J. (Shorples Speciality Co.). 19,739.
Producing Cakes of Solid Crude Paraffin Residue. Szekeley, A. 19,727.
Removal of Free Fatty Acids, Deodorising and Refining Oils, and Fats. Vakil, K. H. 19,701.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C.

1918.

Metal Chlorides. Heap, W.; and Newbery, E. 1,677 130,626
Acetic Aldehyde from Acetylene. Compagnie des Produits Chimiques d'Alais et de la Camargue. 3,589. 130,650
Preparation of Acetic Acid by Means of the Oxidation of Acetaldehyde. Compagnie des Produits Chimiques d'Alais et de la Camargue. 3,590. 130,651
Acetic Anhydride. Dreyfus, H. 3,797. 130,660
Nitrated Cellulose Products. Thomson, W. B.; Severn, W. D.; and Twycross, G. 4,029. 130,665
Manufacture of Acetone and Butyl Alcohol by Fermentation. Ricard, E. 4,047. 130,666
Treating Material with Gas or Vapour. Slocum, F. L. 4,453. 130,680
Vaporisation of Liquid Gases for Maintaining a Supply of Gas. Dibdin, R. A. 4,526. 130,686
Fixation of Nitrogen. Fearson, R.; and Parkes, H. C. 4,623. 130,693
Fuel Oils. Tinker, F. 4,757. 130,699
Hydrogen-gas Plants. Dempster, R. and J.; and Ballingall, J. M. 4,802. 130,701
Preparations Containing Colloidal Copper Compound for Fungicidal and Like Purposes. Mond, R.; and Heberlein, C. 7,576. 130,709
Sulphuric Acid. Quinan, K. B. 8,322. 130,712
Impregnation or Charging of Porous or Permeable Substances or Materials with Liquid or Plastic Materials. Carter, J. E.; Wright, S. A.; and Ratcliffe, W. 12,457. 130,731
Gas-analysing Apparatus. Egnell, Aktiebolaget Ingeniorsfirma F. 12,483. 118,112
Gas-analysing Apparatus. Egnell, Aktiebolaget Ingeniorsfirma F. 12,583. 118,114
Treatment of Textile Fibres and Fabrics and Other Porous or Absorbent Substances to Render Same Less Inflammable. Spence and Sons, P. and Craig, T. J. I. 12,683. 130,743

Drying Powdered Material. Ionides, A. C. 12,760. 130,755
Electrolytically Separating Nickel from Copper. Guess, G. A. 13,231. 118,629
Concentrating Ores. Ferguson, A. 15,598. 130,838
Strontium Peroxide. Pierce, J. B. 15,691. 130,840
Sodium Permanganate. Tyrer, D. 16,446. 130,844
Freeing Liquids from Particles Suspended Therein. Titan Company. 17,811. 121,457
Caoutchouc Substances. North British Rubber Company (Goodyear Tire and Rubber Co.). 17,968. 130,857
Composition for Cleaning Condenser Tubes. Urruty, J. 18,343. 121,590
Artificial Fuel Composition. Dalton, R. F. 19,645. 122,402

1919.

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Fractional Distillation. A. G. Green and Levinstein, Ltd., Manchester. British Patent, 128,362, of 1918.

Evaporators of the "climbing-film" type are used for the separation of liquids by fractional distillation. In the arrangement shown, the mixture to be treated passes from a tank *h* to the evaporator *a*. The vapour passes to a condenser *f*, and the unevaporated liquid to a tank *j*. From

the tank *j* the liquid passes to a second evaporator *b*, the vapour from which passes to a condenser *g*, the condensate passing to the feed-tank *h* connected to the evaporator *a*. The unevaporated liquid from the evaporator *b* passes to a tank *m*. A system for separating three liquids also is described.

Preparing Solutions. F. W. Thorold and J. M. Sinclair, Toronto, Canada. British Patent, 128,531, of 1918.

In an apparatus for dissolving chemicals under pressure, the chemical 2 may be supported within a container 3, which is closed by a liquid-tight door 1. Solvent under pressure

is introduced through a pipe 10 having a needle or other regulating-valve 9. The solution is forced by the pressure of the incoming solvent through valve-controlled pipes 12, 13, 14, etc., to desired destinations. In one application of the invention, the chemical is aluminium sulphate, and the pipe 10 is connected to a commercial water supply. A filter or strainer may be placed in the path of the solvent to remove sediment, etc. The apparatus may be used to prepare a solution of bleaching-powder, lime solutions for tanneries, brine solutions for canning factories, inks or dyes, etc. The container may be of glass for use by druggists or manufacturing chemists.

Treating Metal Surfaces. Imperial Trust for the Encouragement of Scientific and Industrial Research, Institute of Metals, G. D. Bengough, and O. F. Hudson, London. British Patent, 128,297, of 1917.

The surfaces of copper or copper alloys are provided with a protective coating by heating the article to a temperature not exceeding 450° C. in contact with an oxidising medium such as air, or an oxidising atmosphere, or a liquid such as a permanganate solution or a solution of a carbonate containing also dissolved air. For example, a brass condenser tube may be heated to 200-400° C., and the resulting oxide surface

may be improved by a light drawing operation. The oxide may be converted into an oxy-salt by exposure to the atmosphere, or by subjecting the article to the action of water or a saline solution, or a solution of a carbonate into which steam is passed. The oxidation and conversion into oxy-salt may be effected in one operation. In the case of a copper-zinc alloy, the surface may be first enriched in copper by removing some of the zinc by means of acid or a copper solution.

Refining Oils. J. B. Carper, London. British Patent, 128,326, of 1918.

In refining mineral and tar oils, the oil is distilled, and the distillate is agitated in the cold with (1) a small proportion, say 1 per cent. of a solution of sulphuric acid, preferably of 60° Bé.; (2) a larger proportion, say 4 per cent., of a solution of sulphuric acid; (3) a solution of caustic alkali; and (4) pure soft water or petrol, water-white benzole, or other light spirit; the oil is then subjected to fractional distillation. The agitation during the chemical and washing treatment is effected by means of cold compressed air, and the oil is allowed to settle after each agitation. The process is applied to spent oils from the washing of coal-gas for the recovery of benzole and toluol, or to sharp, middle, creosote, naphtha, paraffin, cracked, and other oils. In one form of the process the oil is first distilled up to 300 or 325° C., and after the chemical treatment, distillates collecting up to 180° C., at 180-225° C., and at 225-360° C., are obtained. The light distillate is

mixed with, say, 25 per cent. of benzole, petrol, or other light oil, and the mixture is distilled up to 175-180° C. to produce a motor fuel; the product may be redistilled up to 135-145° C. The middle distillate may be redistilled or not, and used as a Diesel-engine fuel. The heavy distillate may be used as a paint. In a modification, the original oil is fractionally distilled, and the distillates collecting up to 195° C., at 195-210° C. and at 210-240° C., are mixed, and the mixture is subjected to the chemical treatment. In the subsequent fractional distillation, a motor spirit is collected up to 130° C., then light and heavy rubber solvents, and finally a heavy oil for use as a lubricant or fuel. The apparatus consists of a tank A in which the distilled oil is agitated with reagents by means of cold compressed air admitted by a pipe B, together with a distilling-apparatus, comprising a still C, condenser D, collectors E, E', E'', and storage or settling-tanks F, G, G'.

Picric Acid. Brookes Chemicals, Ltd., and N. Brooke, Lightcliffe, Yorkshire. British Patent, 128,303, of 1917.

Picric acid and other nitro-compounds are prepared by continuously feeding the reagents in proper proportions into a long trough of brick or other acid-resisting material covered in by detachable slabs; the reaction takes place in the first part of the length of the trough, and is completed in the middle portion by means of steam chambers or other heating means in that portion, while in the end portion of the trough the product is cooled by means of cooling-chambers, and is

continuously discharged to filters. Using the apparatus shown in Fig. 2, nitric acid is fed to the trough *a* by a pipe *f*, phenol sulphonic acid and, if desired, waste acid being fed in by other pipes (not shown). The trough is provided with baffles *b*, *c*. In the middle portion of the trough, chambers *i* heated by steam-pipes *m* serve to heat the materials, while, in the end portion, cooling-chambers *q* supplied with cold water by pipes

r are provided; the cooled product flows off by a channel *t* to the filters. The trough is covered in by detachable slabs *d* of stone, concrete, etc. Nitrous gases evolved are led off by suitable pipes to a fume chamber. The materials in their passage through the trough are agitated by compressed air or by mechanical agitators. Direct steam boiling may be employed instead of the steam chambers.

Drying Trinitrotoluene. Clayton Aniline Company and A. Schedler, Clayton, Manchester. British Patent, 128,263, of 1917.

Trinitrotoluene is dried by causing it to flow in a molten condition through a heated tray long enough to effect the drying in one continuous operation, the trinitrotoluene being exposed in small quantities and for a short time only to the heat of the tray. The apparatus consists of a tray *a*, preferably inclined, with a steam-jacket *b* at its base. A packing *e* of asbestos or other insulating-medium is provided to minimise condensation. The tray is divided into compartments by walls *f*, which are perforated at the bottom so that the liquid can flow through, as well as over, the walls. The heating-surface of the tray may be corrugated or divided by ribs or cross-bars. Wooden baffles or a grillage may be laid in the tray to break up the flow of the liquid. In using a tray 10ft. long, the trinitrotoluene enters at 90-95° C. and leaves in a dry condition at 110° C.

Catalysts. H. E. F. Gould-Adams, J. R. Partington, Lostock Gralam, Cheshire; and E. K. Rideal, Westminster. British Patent, 126,716, of 1917.

The catalytic oxidation of ammonia is effected by means of a catalyst prepared by gently heating a chromium salt of a volatile base such as ammonium bichromate or chromate. The resulting chromium oxide may be employed alone or with other oxides. The catalyst may be used in the form of blocks or pellets.

Distillation Apparatus. J. H. Corthesy and S. T. S. Castelli, London. British Patent, 127,690, of 1918.

The liquid to be treated is introduced in the form of drops or spray, which is given a whirling motion by means of tangential jets of vapour similar to that produced by the distillation. The upper end of a still *a* heated by a furnace *b* has holes *d* through which the liquid is fed. A fan *p* in a circuit *a, a'* withdraws vapour from the still outlet pipe *q*.

and forces it into the space *m* between an inner wall *t* and the outer wall of the still *a*. The vapour passes into the still through tangential slots *n* and imparts a rotary motion to the contents. The unvolatilised liquid passes out by a nozzle *f*. Fig. 3 shows a fractionating-still in which the vapour outlets are concentric, and each chamber has a separate nozzle *s* for the entry of vapour under pressure. The liquid passes from one chamber to another by way of slots or holes *q*.

Treatment of Catalytic Materials. E. B. Maxted and G. R. Ridsdale, Walsall, Staffordshire. British Patent, 127,025, of 1917.

In order to maintain the activity of catalysts and substances reacting with gases at high temperatures, vapour of an alkali-metal compound such as caustic soda or potash is added to the gases, for instance, by passing these over the compound heated to a temperature higher, say by 100° C., than the maximum employed for the reaction. An alkaline activator may also be added directly to the catalyst in known manner. Examples of processes to which the invention may be applied are: (1) The production of hydrogen by the interaction of carbon monoxide and steam in presence of iron, nickel, cobalt, or their oxides; (2) the synthesis of ammonia in presence of iron; (3) the production of hydrogen by alternately passing a reducing-gas and steam over iron oxide, the alkaline compound being added to either gas or both.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Ammonium Sulphate. Soc. Industrielle des Produits Chimiques, Paris. British Patent, 127,549. Convention date, May 27, 1918.

Ammonia is removed from coke-oven and like gases by treatment with solution of sodium bisulphate at 70° C., with the production of sodium ammonium sulphate. The double salt is agitated at the boiling-point (111° C.), when anhydrous sodium sulphate precipitates, and is filtered off at 110° C., and the solution is cooled to 70° C. to obtain ammonium sulphate; or a solution of the double salt containing 15 parts of sodium sulphate to 100 parts of water is cooled to about 0° C., when hydrated sodium sulphate separates out, and the ammonium sulphate is obtained by concentration or by cooling; or the double salt is heated to 350–600° C. to obtain ammonia and sodium bisulphate, which is used again.

Cellulose Ester Solutions. H. Dreyfus, London. British Patent, 128,215. Convention date, March 4, 1914.

The following bodies are employed as solvents or camphor substitutes for cellulose acetates and other esters: (1) Benzyl alcohol or its substitution products—*e.g.*, chlorobenzyl alcohol—purified from benzaldehyde by means of sodium bisulphite, and also free from side-chain chlorination products (benzyl chloride, etc.); (2) other aromatic alcohols—*e.g.*, diphenylcarbinol; (3) acetophenone or *o*- or *p*-methylacetophenone, purified by means of sodium bisulphite; (4) alkyloxy derivatives of acetophenone, benzophenone, or their homologues—*e.g.*, methoxy- or ethoxy-acetophenone; (5) derivatives of acetophenone or benzophenone halogenated (chlorinated) in the benzene nucleus; (6) cyclohexanone or its homologues or derivatives—*e.g.*, methyl- or dimethyl-cyclo-

hexanone, or "cyclonaphthanone"; (7) alcohols corresponding with the cyclic ketones mentioned under (6). These solvents or camphor substitutes may be employed alone or together with methyl alcohol, ethyl alcohol, acetone, methyl acetate, mixtures of methyl alcohol and acetate, etc., in the manufacture of varnishes, films, celluloid-like masses, etc.

Magnesium Chloride. P. L. Hulin, Grenoble, France. British Patent, 128,327. Convention date, January 13, 1917.

In the process for dehydrating magnesium chloride in an atmosphere of hydrochloric acid gas, chlorine and hydrogen are caused to combine in proximity to the hydrated chloride, whereby the heat of the reaction dehydrates the chloride, the atmosphere of hydrochloric acid gas preventing formation of oxychloride. The temperature of the reaction may be reduced by using an excess of chlorine, or gaseous hydrochloric acid, preferably from the discharge outlet of the apparatus, may be mixed with the hydrogen and chlorine. The gaseous hydrochloric acid formed may be absorbed in water.

Hardening Lacs, Gums, Etc. W. W. Simonson and L. Van D. Blair, Chicago, U.S.A. British Patent, 127,825. Convention date, June 1, 1918.

In a process for indurating and toughening lacs and like resinous exudates, the natural lac is freed from impurities and then rendered wax-free by treatment in a usual manner with hot caustic soda, kaolin being kept as a clarifying agent. Induration is effected by mixing the clarified solution, having no free caustic soda, with lead acetate and sufficient water to precipitate in flakes a shellac-lead compound which, when washed and dried, is an indurated gummy product. To obtain a tough and further indurated product, this shellac-lead compound is heated and fused, and, if applied to an article in a fused state and heated, will adhere strongly thereto. Heating after fusion eliminates water, produces polymerisation or condensation, and increases the viscosity of the fused and adherence of the solidified compound. The shellac-lead compound may be mixed with wax-free shellac obtained by treating the clarified caustic soda solution with hydrochloric acid, and the mixture subjected to heat as described, the temperature of fusion of the mixture being varied by varying the proportions of the components and by the substitution of different metals for lead in the metallic derivative. Barium, calcium, magnesium, zinc, and other metals may be substituted for lead. The fluency of the compound may be varied by introducing inert substances such as talc and calcium sulphate. Charcoal may also be added to shorten the time necessary to secure the desired induration. The shellac-metal compound may be prepared by dissolving the shellac in alcohol or acetone, adding the desired metal hydrate, and evaporating the solvent. The indurated product, either before or after having been fused, may be mixed with a solvent and applied as a varnish.

MARKET REPORTS.

TAR AND AMMONIA PRODUCTS.

WEDNESDAY.

Benzole: London, 90%, 2s.; North, 1s. 10d. to 1s. 11d.; 50%, 1s. 10d.; North, 1s. 9½d., naked. Crude tar, London, 45s. to 50s.; Midlands, 44s. to 46s.; North, 45s. per ton, ex works. Pitch 72s. 6d. to 75s.; East Coast, 65s. to 70s. f.o.b.; West Coast, 53s. to 55s., f.a.s. Solvent naphtha, naked, London, 90-100%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 90-160%, naked, London, 2s. 1d.; North, 1s. 10d. to 1s. 11d. Crude naphtha naked, 30%, 9d.; North, 8d. to 8½d. Refined naphthaline, £16. to £18.; salts, £6. to £7. Toluol, naked London, 2s. 6d.; North, 2s. 5d. Creosote, naked, London 6½d.; North, 5½d. to 6d.; heavy oil, 6½d. to 7d. Anthracene, 40-45%, 7d. per unit. Cresylic acid, 95%, 2s. 7d. to 2s. 8d.; 97-99%, 2s. 9d. to 2s. 10d., ex works, London, and f.o.b. other ports. Sulphate of ammonia: home trade, £19. 10s. per ton; basis 24½%. Nitrate of soda, £21. to £22.

LONDON METAL MARKET.

THURSDAY.

Copper: Standard brands, £100. 15s. to £101. cash; £101. 15s. to £102. three months; electrolytic, £109. to £120. Tin: Standard, £274. 10s. to £275.; cash, £269. 10s. to £270. three months; Straits, £276.; English, £270. Lead:

Soft foreign, £24. 17s. 6d.; English, £26. Spelter, £40. 12s. 6d.; hard, £31. Antimony, English, regulus, 90% £42. Aluminium, £150. Nickel, £205. delivered, packages extra. Quicksilver £23. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 30s. per unit.

FERTILISER MATERIALS.

LIVERPOOL, THURSDAY.

Nitrate of soda is unchanged, the quotation on spot for 95/96% quality being £20. 2s. 6d. per ton cash, f.o.r., prompt delivery. East Indian Bone Meal for shipment is slightly easier, the nearest value of 4½% ammonia and 52% phosphate, September-October shipment, being £14. 10s. per ton, net cash, ex ship Liverpool. On spot Liverpool, holders require £15. per ton, net cash, for 4½% and 45% quality. Mineral phosphates: There is no alteration to report in this market and values are at present only nominal. Dried blood scarce, the value being about 30s. per unit of ammonia per ton, net cash.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

The demand, generally, for heavy chemicals continues fairly satisfactory and values all round, with few exceptions, are steady in tone. Makers' quotations for caustic soda are unchanged, but a few resale parcels of 70% are on offer at £17.

per ton. 58% alkali is firm at £6. 15s. and refined bicarbonate of soda, bags, at £7. 10s. per ton. Bleaching powder still quiet at £15. for spot lots, softwood casks on rails. Chlorates are easier at 6½d. and 1s. per lb for soda and potash respectively. Bichromates unaltered at recent rates. Recovered rock sulphur £17. per ton on rails. Roasted saltcake firm at 60/- per ton carriage paid. There is still no sign of improvement in the export demand for copper sulphate and quotations are lower at £43. per ton f.o.b. Liverpool. Nitrite of soda firm at £59. per ton basis 100%. Phosphate of soda higher at £26. per ton. Commercial hypo-sulphite of soda unaltered at £16. 10s. per ton. Arsenic continues very scarce and £55. is quoted for odd small parcels. Yellow prussiate unchanged. Potash at 1s. 9d. and soda 7d. per lb. Carbonate of potash higher at £9. per ton for 85%. Lead salts are in active request: white acetate £85., brown £75. Lead nitrate £56. per ton. Acetic acid and acetate of soda are steady in price but there is not much inquiry. English brown acetate of lime in short supply and price firm at £11. per ton. Grey £17. 10s. to £18. per ton. Green copperas is moving off slowly and price easy at £4. 10s. in truck loads. Oxalic acid unchanged at 1s. 2½d. per lb.

TURPENTINE MARKET REPORT.

Messrs. James Watt and Son, Ltd., of 101, Leadenhall Street, London, E.C.3, report that the stocks of turpentine on August 16 were: American, 28,993 barrels, compared with 6,955 barrels at the corresponding date of 1918; French 45 barrels (14 barrels); and Spanish, 658 barrels (1,383 barrels). Deliveries during the week ended August 16 were 1,812 barrels, against 496 barrels last year, and since January 1 45,115 barrels, compared with 16,216 barrels in 1918. The price on Saturday last was 123s. per cwt., compared with 120s. at the corresponding date of last year. September-December delivery was quoted at 124s. 3d. and January-April (1920) 126s.

SWANSEA MARKET REPORT.

THURSDAY.

Prices of tinplates were practically unaltered at 35s. per standard box f.o.b. A stronger tone prevailed among copper buyers, and prices were harder but somewhat irregular, varying between £101. to £102. per ton cash and £98. 5s. three months. Tin in better call and slightly easier at £271. cash and £265. 10s. three months. Lead ruled steady with fair sales over next month at £26. per ton with immediate delivery at £25. for Spanish; English was unchanged at £26. Spelter very firm at £40. 10s. prompt and £41. three months. Zinc sheets dearer at £66. per ton f.o.b., at New York. Silver 59½ per ounce. Nickel £205. per ton including free delivery to London or equal. Quicksilver £23. 5s. 0d. per bottle. Antimony nominal, with English regulus 90% at £42. Aluminium £150. Sulphate of copper rather dull at £43. per ton and upwards for home purposes and £47. per ton in casks f.o.b. 5% for export business. Sulphate of ammonia steady at £19. 10s. 0d. per ton for delivery over current quarter; export business quiet. Nitrate of soda quiet, but steady at 21s. 9d. per cwt., in bags. Seed oils steady and in poor supplies. Palm oil rather dull, with Lagos and softs at £90. 10s., Benin £85., and hards £80. Petroleum in strong demand; American refined at 1s. 5½d. to 1s. 6½d. per gallon in casks. Turpentine quiet at £6. 4s. 0d. per cwt. net. Arsenic in better request at £48. 10s. 0d. per ton, for white powdered in bags f.o.b. Oxalic acid 1½d. per lb. Bone meal slightly cheaper at 15/9 per cwt. Pitch dealer at 53/6 per ton at works.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

A very fair inquiry for chemicals has been experienced, the strong undercurrent of business maintaining its flow, despite the many temporary interruptions and menaces that have affected one branch of industry and another, within the past three weeks. Irresponsible strikers and disturbers of the peace are learning a salutary lesson, by finding that a strike or a riot hits the wage earners as hard as anyone, and that strike doles of eight or nine shillings a week are no sort of equivalent for three, four, five, six or more, pounds a week; with prices as they now are. The strike unrest, has, accordingly, subsided largely, if not entirely; and things are going on orderly and steadily again. The demand for chemicals has consequently been almost, if not entirely normal. Bleaching powder has been in slightly more request, and is £14. 10s. to £15. per ton, free on rail or conveyance, in buyer's packages, and £17. per ton, for export. Chloride of calcium has

been in very fair inquiry and is £8. to £11. per ton, in casks, f.o.r. Caustic soda has sold with some freedom and is £24. per ton for 76%; £22. per ton for 70 to 72%, and £19. per ton for 60 to 62%. Nitrate of soda has had a quietly steady sale and is £20. 10s. to £21. 10s. per ton. Saltcake has been more inquired for and is £6. 10s. per ton, in casks, f.o.b. Soda crystals have been in good request and are £5. per ton, in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has again been in active demand and is £7. 5s. to £10. per ton, according to terms of delivery. Borax has been well inquired for and is £42. per ton for ordinary and £44. per ton for powdered, in bags. Ammonia alkali has been freely called for and is £6. to £6. 5s. per ton, f.o.r. at works. Hyposulphite of soda has been in moderate demand, and is £17. per ton for ordinary, and £22. per ton for pea crystals. Sulphite of sodium has been but little called for, and is £10. per ton for ordinary and £16. to £18. per ton for pea crystals in lewt. kegs. Bichromate of soda has been in moderate request and is 9d. per lb. Phosphate of soda has been quiet and is £25. per ton. Sulphide of sodium has been rather more in demand and is £20. per ton, in casks, and £22. per ton, in drums. Chlorate of potash has been in moderate request and is 1s. 1d. to 1s. 3d. per lb. Permanganate of potash has been in fair inquiry and is 3s. 6d. per lb. Sulphate of potash continues to be but little called for and is £85. to £90. per ton for 80 to 85%. Caustic potash has been more in request and is £90. to £100. per ton, for 35°Bé. Nitrate of potash has had a quietly steady sale, and is £54. to £60. per ton for refined and £40. per ton for ordinary. Canadian potashes have had a very limited sale. Montreal first quality are £200. to £220. per ton and second quality, £190. to £210. per ton. Bichromate of potash has been in quietly steady demand, and is 1s. 6d. to 1s. 7d. per lb. Yellow prussiate of potash has been quieter and is 1s. 9d. to 1s. 10d. per lb. Salammoniac has been in fair request and is £80. per ton for lump, £75. per ton for seconds, and £5. extra per ton for ground. Sulphate of ammonia has been quiet and is £19. 10s. per ton, less traders' discount of 10s. per ton, free to nearest wharf or station; to September 30. Carbonate of ammonia has been rather more in request and is 6½d. per lb. Muriate has been inactive and is £50. to £60. per ton, according to quality. Magnesia has sold more readily. Carbonate is £3. 10s. 0d. per cwt., and sulphate, £10. to £16. per ton, according to grade. Alum has been in good demand, and is £18. 10s. per ton for the home trade, and £18. 10s. to £19. 10s. per ton for export. Aluminoferic has been but little in request and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina has been very quiet and is £12. to £17. per ton, according to grade. Sulphur has been more inquired for. English kinds are:—flowers, £32. per ton; roll, £28. per ton, and rock, £22. per ton, in bags, f.o.b. Sicilian grades are: flowers, £28. per ton; roll, £22. 10s. per ton, and rock, £17. 15s. per ton. Cream of tartar has been in good request and is somewhat dearer. Prices are from £11. 10s. to £12. per cwt. Tartaric acid has had a rather free sale, and is 3s. 1d. per lb. Boracic acid has been in very fair request, and is £72. per ton for crystals and £74. per ton for powdered. Oxalic acid has had a moderate sale and is 1s. 3d. per lb. Citric acid has been more inquired for and is 4s. 4d. per lb. White acetate of lead has had a limited sale, and is £85. to £90. per ton. Arsenic has been in fair request, and is £50 per ton, for white powdered. Sulphate of copper has been but little in demand, and is £15. per ton for farm purposes in the United Kingdom, and £47. to £48. per ton, less 5%, in casks, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.

THURSDAY

Trade continues brisk and there is a good demand for home consumption—for export the inquiry is also improving. Locally soda crystals are in good request at £5. per ton, 2cwt. bags. Rock sulphur scarce and in demand at £24. per ton.

The following prices are per ton net: Bleaching powder, softs and hards, £15.; caustic soda, 74/77%, £23. 5s.; do., 70%, £22.; do., 60%, £20.; recovered sulphur, 2cwt. bags, £24.; hyposulphite of soda, 5/7cwt. casks, £19.; lewt. kegs, £25.; sulphite of soda, 5/7cwt casks, £12.; do., lewt. kegs, £20.; silicate of soda, 75Tw., £9. 12s. 6d.; do., 100Tw., £10. do., 140Tw., £10. 10s.; soda crystals, 2cwt. bags, £5.; sulphate of soda (salt cake) in bulk, £3. 10s.; pure white sulphate of alumina, 14/15%, £19. 10s.; blanc fixe, £22.; chloride of barium, £27.; sulphide of sodium, crystals, £18., do., refined concentrated solid, 60/62%, £25.; hydrate of barium, crystals, £56.

COALS.—Market very strong and for delivery during September and forward the position is still firmer. The home demand continues very full and the surplus for shipment abroad is extremely limited. Export prices nominally—best Northumbrian steam coal, 95s. to 100s. per ton, second qualities, 90s.; Northumbrian small coals, 65s. to 75s., seconds, 60s.; best Durham gas coals, 75s. to 80s., seconds, 67s. 6d. to 72s. 6d.; gas coke, 80s. to 85s.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

A fairly good volume of business has been transacted during the week at steady prices and the general range of quotations remains pretty well unaltered. There have not been a great many big deals carried out, but between moderate and small transactions the sum totalled has been well up to standard. Certain of the heavy chemicals have been in more request than others, but generally speaking all have been getting a run. Quotations:—Arsenic, £48. per ton net, Glasgow; bicarbonate of soda, £8. 15s. and £10. per ton for 6-8 casks and 1ewt. kegs, Liverpool; boracic acid crystals, English

refined, £72. for 2cwt. bags, and borax crystals, £39. for 2cwt. bags, carriage paid; caustic soda, white, 70-72%, £24. per ton, net Glasgow; chlorate of potash, 1s. 1d. per lb. net, Glasgow; chlorate of soda, £3. 4s. per cwt. net, Glasgow; citric acid, 4s. 4d. per lb. 5% Glasgow; cream of tartar 88%, per cwt. net, Glasgow; salammoniack, £80. and £75. per ton, net, any port for first and second lump respectively; salammoniack crystals £85. per ton, net, Glasgow; saltpetre, £3. 4s. net, Glasgow; tartaric acid, 3s. 1d. per lb., 5% Glasgow.

Among the sea oils there is still a pronounced scarcity, and again only one price is quotable—this being the black variety of whale oils which is still selling at 78s. None of the other whale oils are available—pale, yellow, nor brown—and black is only forward in limited quantity. There is no market for Newfoundland cod, pale seal, nor Menhaden.

In the local coal trade the demand is fairly steady without being particularly active industrially or otherwise. Most works are now able to keep themselves in sufficient supply without much difficulty and the domestic demand is meantime on a low ebb. From the export point of view there is next to nothing doing and almost the entire output of the pits is being focussed upon home requirements.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

BRISTOL.

Publication of Official Returns
Suspended.

GLASGOW.

Week ending August 16.

CALCIUM SULPHIDE—
Rouen, 250 drms.

MAGNESITE—
Montreal, 896 bgs.

OCHRE—
Baltimore, 320 brls.

ROSIN—

Christiania, 10,000 galls.
Cresylic Acid
Christiania, 800 galls.

MAGNESIUM CARBONATE—
Nantes, 60 cs.

PARAFFIN WAX—
Christiania, 10 t.

POTASSIUM BICHRIMATE—
Christiania, 8 c.; Rotterdam, 2 t. 7 c.

ROSIN OIL
Rotterdam, 2 t.

SOAP—
Christiania, 8 t.

SODIUM BICHRIMATE—
Nantes, 70 cks.

GRIMSBY.

Week ending August 9.

NIL.

HULL.

Week ending August 12.

ALUMINA SULPHATE—
Rotterdam, 100 bgs.

BORAX
Amsterdam, 10 cks.; Rotterdam, 100 cks.

CHEMICALS (otherwise undescribed)
Alexandria, 1 cs., 30 cks., 800 bgs.; Antwerp, 115 cs., 2 drms., 4 cks., 15 kgs., 82 bgs., 48 brls.; Barcelona, 21 cks., 161 bgs.; Bombay, 845 brls.; Christiania, 2 cs., 2 cks., 41 kgs., 57 bgs.; Copenhagen, 1 cs., 1 drim., 3 brls.; Gibraltar, 1 ck.; Gothenburg, 1 stek., 3 cs., 83 drms., 93 cks., 100 pkgs., 24 erts.; Karachi, 955 brls.; Malta, 55 drms.;

CHEMICALS (otherwise undescribed)
Mantyluoto, 1 ck., 2 cs., 1 drim.; Valencia, 200 bgs.; Wasa, 5 cks.

COAL PRODUCTS—
Tar
Wasa, 158 brls.

CREAM OF TARTAR—
Gothenburg, 2 cks.

DISINFECTANTS (otherwise undes.)
Bombay, 1,400 drms., 12 cs.; Rotterdam, 100 cks.

DYESTUFFS (otherwise undescribed)
Rotterdam, 616 bgs.

GLUE—
Barcelona, 40 bgs. Christiania, 20 bgs.; Copenhagen, 1 bg.

PITCH—
Alexandria, 10 cs.

SALT—
Barcelona, 120 cs.

SOAP—
Antwerp, 404 cs.; Christiania, 3,525 cs., 105 kgs.; Gibraltar, 7 cs.

TAR—
Alexandria, 1 bx.; Christiania, 100 brls.; Gothenburg, 25 brls.

WAX—
Rotterdam, 19 cks.

LEITH.

Week ending August 16.

COAL PRODUCTS (otherwise undes.)
Gothenburg, £36.; New York, £540.

COAL PRODUCTS—
Creosote Oil
New York, 17 t. 2 c., £170.

Pitch
Iceland, £3.

COPPER SULPHATE—
Iceland, 12 t. £37.

MAGNESIUM CARBONATE—
Dunkirk, 100 t., £240.

POTASSIUM BICHRIMATE—
Gothenburg, 3 t. 10 c., £559.

SODA
Iceland, 10 t. 4 c., £59.

SODIUM BICHRIMATE—
Gothenburg, 19 c., £95.; Rotterdam, 15 t.; Rouen, 600 t. 18 c., £16,827.

LIVERPOOL.

Week ending August 14.

ACETIC ACID—
Venice, 1 t. 1 c., £95.; Volo, 12 c., £56.; Valparaiso, 12 c., £57.

ACETO SALICYLIC ACID—
Constantinople, 7 c., £228.

ALUM—
Abo, 1 t. 10 c., £70.; Callao, 2 c., £3.; Lagos, 5 c., £15.; Palermo, 19 c., £17.

ALUMINA SULPHATE—
Barcelona, 18 t., £400.; Passages, 5 t., £95.

AMMONIA—
Madeira, 4 c., £15.; Monte Video, 8 c., £30.

AMMONIUM CARBONATE—
Corunna, 1 t. 10 c., £95.; Colombo, 2 c., £8.; Fremantle, 10 c., £31.; Gothenburg, 1 c., £61.; Pernambuco, 1 t., £82.; Rangoon, 2 t., £190.; Talcahuano, 1 t., £58.; Valencia, 5 c., £20.

£14.; Malacca, 1 c., £9.; New
York (crude), 10 t. 5 c., £680.;
Soerabaya, 1 c., £7.

GOLD CHLORIDE

Colombo, 1 cs. (pt.), £7.

HEXAMETHYLENETETRAAMINE

Iquique, 1 cs. (pt.), £10.

HYDROCHLORIC ACID

Beira, 2 t. 10 c., £39.; Colombo,
2 c., £8.; East London, 2 c.,
£23.; Gibraltar, 1 c., £5.;
Karachi, 2 t. 6 c.; Rio de Janeiro,
9 c., £36.

HYDROFLUORIC ACID

Beira, 3 cs., £32.

HYDROGEN PEROXIDE

Cape Town, 4 cs., £25.; East
London, 1 cs., £6.

IODINE

Buenos Ayres, 1 cs. (pt.), £12.;
Karachi, 1 cs. (pt.), £6.; Rio de
Janeiro, 1 cs. (pt.), £11.

IODINE (RESUBLIMED)

Christiania, 1 cs. (pt.), £21.;
Durban, 1 cs. (pt.), £6.; Madras,
1 cs., £90.

IRON AND AMMONIUM CITRATE

Buenos Ayres, 2 cs. (pt.), £25.;
Calcutta, 1 cs., £12.

IRON CARBONATE

Calcutta, 1 ck. (pt.), £5.

IRON GLYCEROPHOSPHATE

Buenos Ayres, 1 cs. (pt.), £8.

IRON PERCHLORIDE

Monte Video, 4 cs., £8.

LACTIC ACID

Paris (F.), 5 cks., £15.

LEAD ACETATE

Bombay, 100 kgs., £338.; Madras
1 cs. (pt.), £15.; Padang, 2 cs.,
£17.; Piraeus, 1 ck., £11.

LITHIUM BENZOATE

Rio de Janeiro, 1 cs. (pt.), £10.

MAGNESIA (CALCINED)

Guayaquil, 4 cs., £19.; Rio de
Janeiro, 2 cs., £20.

MAGNESIUM CARBONATE

Alexandria, 2 cs. (pt.), £7.;
Guayaquil, 4 cs., £7.; Melbourne,
4 cs., £10.; Rio de Janeiro, 3 cs.,
£14.

MAGNESIUM CITRATE

Buenos Ayres, 2 cs., £14.;
Penang, 1 cs., £6.; Pt. Madryn,
17 pkgs. (pt.), £23.

MAGNESIUM SULPHATE

Beira, 4 c., £6.; Bocas del Toro,
6 c., £14.; Brisbane, 1 c., £6.;
C. Town, 6 c., £8.; Cartagena,
6 c., £14.; Colon, 1 t., £43.;

Video, 3 t. 19 c., £79.; Panama,
1 t. 4 c., £61.; Rio de Janeiro,
1 t. 17 c., £56.; Sierra Leone,
8 c., £15.; Singapore, 4 c., £9.;
Sydney, 11 c., £21.

MANGANESE BINOXIDE

Antwerp, 3 cks., £35.

MERCURY BICHLORIDE

Constantinople, 1 cs. (pt.), £35.

MERCURY CYANIDE

Iquique, 1 cs. (pt.), £40.

MERCURY OXIDATE

Constantinople, 1 cs. (pt.), £35.

MERCURY PERCHLORIDE

Rangoon, 1 cs., £18.

METHYL ETHYL KETONE

Paris, 1 dr., £14.

METHYL SALICYLATE

Durban, 2 cs., £11.

METHYLENE BLUE

New York, 2 pkgs., £68.

MINERAL BLACK

Antwerp, 4 cks., £15.

NAPHTHOL SALICYLATE

Buenos Ayres, 1 cs. (pt.), £8.

NICKEL AND AMMONIUM SULPHATE

Rotterdam, 1 ck., £15.

NICKEL SALTS

Paris, 46 cks., £480.

NIGROSINE BASE

Havre, 1 ck., £56.

NITRIC ACID

Colombo, 3 c., £13.; Channel
Islands, 2 c., £6.; Karachi, 2 c.,
£5.; Pt. Dickson, 2 cs., £5.

PARAFFIN WAX—

Amsterdam, 2 c.; Bangkok, 11 c.; Lisbon, 20 c.

PEARL ASH—

Cape Town, 1 ck., £18.

PHOSPHATE—

Calcutta, 11 t. 16 c., £200.

PHOSPHORIC ACID—

Beira, 16 cs., £141.; Montreal, 20 crbys., £182.; Naples, 20 crbys., £390.; Paris, 40 crbys., £356.; Pt. Elizabeth, 1 cs., £8.; Rio de Janeiro, 1 ck., £18.

PHOSPHORUS—

Dunedin, 25 cs., £332.

PLUMBAGO—

Christiania, 1 t. 1 c.

POTASSIUM ACETATE—

Calcutta, 1 cs., £10.; Haarlem, 1 cs. (pt.), £5.; Karachi, 1 cs. (pt.), £9.

POTASSIUM BICARBONATE—

Brussels, 1 cs. (pt.), £5.; Calcutta, 1 cs., £7.; Canton, 10 cs. (pt.), £6.; Colombo, 1 cs., £14.; Karachi, 1 ck., £8.; Rangoon, 1 cs., £10.

POTASSIUM BICHROMATE—

Athens, 40 pkgs., £120.; Cologne, 50 cks., £345.; Monte Video, 5 cks., £98.; Piraeus, 1 ck., £11.; Switzerland, 1 ck., £55.

POTASSIUM BISULPHITE—

Boulogne, 20 cks., £110.

POTASSIUM BITARTRATE—

Canton, 7 cs. (pt.), £6.

POTASSIUM BROMIDE—

Calcutta, 1 cs. (pt.), 1 cs., £32.; Callao, 2 cs., £55.; Canton, 15 cs., (pt.), £6.; Genoa, 3 cs., £41.; Kobe (F.), 33 cs., £162.; Karachi 1 cs. (pt.), £8.; Rio de Janeiro, 5 cks. (pt.), £23.

POTASSIUM CHLORATE—

Bangkok, 1 c., £15.; Iquique, 1 cs. (pt.), £7.; Rio de Janeiro, 1 c., £15.

POTASSIUM CITRATE—

Calcutta, 1 cs. (pt.), £8.; Malacca, 1 cs. (pt.), £8.

POTASSIUM CYANIDE—

Antwerp, 10 c., £112.; Bahia, 1 c., £28.; Canton, 8 c., £174.; Malacca, 1 c., £17.; Paris, 5 c., £70.; Pt. Dickson, 1 c., £12.; Rio de Janeiro, 1 c., £15.; Singapore, 2 c., £50.

POTASSIUM HYDROXIDE—

Pt. Elizabeth, 1 cs. (pt.), £8.

POTASSIUM IODIDE—

Bahia, 1 cs., £55.; Calcutta, 1 ck. (pt.), £78.; Copenhagen, 1 cs., £153.; Durban, 3 cs. (pt.), £5.; East London, 1 cs., £78.; Monte Video (F.), 4 cs., £195.; Pt. Madryn, 17 pkgs. (pt.), £11.; Rio de Janeiro (F.), 2 cs., £182.; Rio de Janeiro, 1 cs. (pt.), £18.; Rotterdam, 1 cs., £15.

POTASSIUM METABISULPHITE

Calais, 10 c., £97.; Cape Town, 20 cks., £190.; Leghorn, 10 kgs., £112.

POTASSIUM MURIATE—

Calcutta, 1 cs. (pt.), £10.

POTASSIUM PERMANANATE—

Beira, 1 cs. (pt.), £89.; Novorossisk (F.), 8 drms., £672.; Rio de Janeiro, 9 cks. (pt.), £56.; Rangoon, 1 cs., £14.

POTASSIUM PRUSSATE—

Buenos Ayres, 1 pkg., £28.; Rosario, 1 ck., £28.

POTASSIUM SULPHIDE—

Callao, 2 cs., £105.; Sao Paulo, 1 cs. (pt.), £9.

POTASSIUM SULPHOGUAI-

ACOLATE—
Buenos Ayres, 1 cs. (pt.), 1 cs., £70.; Rio de Janeiro, 1 cs. (pt.), £22.

PRUSSIAN BLUE—

Copenhagen, 2 cks., £150.

PYROGALLIC ACID—

Colombo, 1 cs. (pt.), £6.; Pt. Elizabeth, 1 cs. (pt.), £5.; Tientsin, 2 drms., £60.

QUININE—

Aden, 137 ozs.; Calcutta, 17,985 ozs.; Cape Town, 259 ozs.

SALICYLIC ACID—

Brussels, 3 cs., £25.; Calcutta, 1 cs. (pt.), 3 cs., £21.; Copenhagen, 6 cks., £63.; Italy, 23 pkgs., £299.; Singapore, 1 kg., £7.

SALT—

Toronto, 2 t.

SALTCAKE—

Ghent, 170 t., £613.

SALTPETRE—

Colombo, 5 c., £18.; Maceio, 6 c., £18.; Pt. Elizabeth, 11 c., £40.; Rio de Janeiro, 6 t. 8 c., £382.; Rotterdam, 1 t., £55.; Santos, 10 t., £600.; Zanzibar, 2 c., £8.

SHEEP DIP—

Beira, 2 c., £5.; Cape Town, 11 c., £39.; Pt. Elizabeth, 5 t. 5 c., £375.; Punta Arenas, 10 t. 5 c., £540.

Brussels, 4 c., £7.; Corinto, 15 c., £30.; Durban, 3 c., £5.; East London, 4 c., £6.; Malta, 1 c., £6.; Panama, 1 t. 2 c., £43.; Rio de Janeiro, 1 t., £25.; Singapore, 3 c., £8.

SODIUM BISULPHITE—

Nantes, 4 c., £11.; Rouen, 35 t., £1,010.

SODIUM BROMIDE—

Callao, 1 cs. (pt.), £11.

SODIUM CARBONATE—

Jaffa, 4 c., £6.; Paris, 1 ck., £16.

SODIUM CITRATE—

Calcutta, 1 cs. (pt.), £6.; Cape Town, 1 cs., £25.

SODIUM CYANIDE—

Antwerp, 4 c., £35.

SODIUM GLYCEROPHOSPHATE—

Genoa, 5 crbys., £110.

SODIUM HYPO—

Bombay, 5 c., £13.

SODIUM HYPOSULPHITE—

Bombay, 1 t. 10 c., £34.

SODIUM IODIDE—

Calcutta, 1 cs. (pt.), £11.; Christiania, 1 cs. (pt.), £21.

SODIUM NITRATE—

Bombay, 12 cks., £251.

SODIUM PYROPHOSPHATE—

Amsterdam, 1 ck., £13.

SODIUM SALICYLATE—

Karachi, 1 cs., £6.; Pt. Elizabeth, 1 cs., £15.

SODIUM SULPHATE—

Amsterdam, 5 c., £6.

SODIUM SULPHATE (GLAUBER

SALTS)—

Alexandria, 1 t. 2 c., £14.; Calcutta, 13 c., £5.

SODIUM SULPHITE—

Antwerp, 2 t. 7 c., £58.; Calais, 3 kgs., £30.; Christiania, 1 t. 4 c., £29.; Jaffa, 4 c., £7.

SODIUM TARTRATE—

Bombay, 2 c., £15.; Madras, 1 cs., £8. Pt. Elizabeth, 1 ck., £7.

SPERMACEETI WAX—

Antwerp, 5 c.

STEARINE WAX—

Antwerp, 2 c.

SULPHUR—

Antwerp, 4 t., £134.; Havre, 5 t., £98.

SULPHUR (BLACK)—

Paris, 2 cks., £16.

Beira, £56.; Boulogne, £614.; Calcutta, £721.; Christiania, £100.; Durban, £10.; Ghent, £325.; Havre, £21.; Ostend, £302.; Paris, £920.; Rotterdam, £9.; Rouen, £247.; Shanghai, £235.

WOOD OIL—

Rotterdam, 2 t.

ZINC OXIDE—

Lisbon, 1 ck., £9.

ZINC SALTS—

Melbourne, 1 cs., £14.

ZINC SULPHIDE—

Bangkok, 3 cks., £8.

MANCHESTER.

Week ending August 13.

ALUM—

Treport, 10 bxs.

ALUM (CHROME)—

Bordeaux, 13 cks.

AMMONIA (LIQUID)—

Bordeaux, 6 drms.

AMMONIUM CARBONATE—

Gothenburg, 20 kgs.

AMMONIUM MURIATE—

Montreal, 17 cks.

BLEACHING POWDER—

Bordeaux, 29 cks.

CAUSTIC SODA—

Gothenburg, 50 drms.

CITRIC ACID—

Montreal, 6 cks.

COAL PRODUCTS (otherwise undes.)

Antwerp, £338.; Gothenburg, £242.; Malmö, £100.; Montreal, £74.; Rouen, £437.

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ..	10s. 6d.	12s.
Quarterly (18 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

Trade Advertisements, Announcements, in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

Advertisers would oblige by writing advertisements and letters of instructions on separate sheets of paper.

EDITORIAL NOTICES.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than Wednesday morning.

CURRENT TOPICS.

FUEL RESEARCH.

IT is now some two years since the Government appointed the Fuel Research Board, and we now learn that the experimental research station at Greenwich is nearing the stage of completion. The problems involved in this work will be mainly chemical, and we ought, eventually, to arrive at some clear conclusions on the question of low temperature carbonisation. The origin of the appointment of the Fuel Research Board was due to the fine preparatory and pioneer work of the Fuel Economy Committee of the British Association, whose annual meeting is to be held in Bournemouth early in September after a break of a year or two—the first in its history—due to the war. The driving force on that Committee was Professor W. A. Bone, and with the appointment of the Fuel Research Board the work of that Committee practically came to an end, inasmuch as it was understood that the Fuel Research Board would take it over. We all fully recognise, of course, that the difficulties of the past few years have made it practically impossible for any research, outside purely war work, to be carried on. Nevertheless, there is a feeling of dissatisfaction that so little has been done, having regard to the fact that the Government took the fuel question out of private hands so far as research was concerned. That was a step which was urged by the British Association Committee, but so far it would seem that slower progress has been made than if those enthusiasts who were working at the problem—but who were handicapped for want of funds—had been allowed to go along in their own way and had been provided with funds. That may or may not have been the case, but we notice that although from the preliminary programme of the British Association no mention is made of any report being forthcoming from the British Association Fuel Committee, in the programme of the Iron and Steel Institute meeting, which will be held later in September, there is to be a symposium on fuel economy more or less under the aegis of the British Association Committee. One of the first things which Professor Bone always laid down as essential to any complete scheme of fuel research and fuel economy was a chemical and mineralogical survey of the coalfields of the United Kingdom, and yet only a few weeks ago we find him complaining in public that so far as he was aware no steps in that direction had yet been taken. The site of the experimental research station of the Fuel Board at Greenwich has been leased at a nominal rent

by the South Metropolitan Gas Co., the chairman of which is Dr. Charles Carpenter, who also has been taking a keen interest in fuel economy. The original plans were that actual experiments would have been commenced within nine months, but we are given to understand that certain requirements of the Office of Works in the matter of the design of the building have had the effect of delaying the completion for nearly another eighteen months; and this in relation to one of the most, if not the most, urgent problems with which the country is faced to-day. Generally speaking, therefore, the position is no further advanced than it was, experimentally, when the British Association Fuel Committee last reported, although, of course, a considerable amount of necessary preliminary work has been carried out. Whatever delays have been occasioned cannot be placed to the account of the Fuel Research Board, which consists of scientific men only too keenly alive to the urgency of the position. Sir George Beilby, and those associated with him, are essentially men of action, as has been shown in their reports already issued, but if the experimental side of fuel economy is to make rapid progress under Government auspices it is essential that it be carried out on business lines, and that the business and scientific men whose services have been secured shall have a free hand without being trammelled by the inevitable circumlocution of Government management.

TRADE PROSPECTS IN INDIA.

FROM the figures given in the annual review of the trade of India, 1917-18, to which we briefly referred a few weeks ago, it will be observed that the British Empire is the greatest factor in India's foreign trade, and this position has been fully maintained during the war, despite the keen and new competition which the war introduced from the United States and Japan. A more recent report from H.M. Trade Commissioner in Calcutta, however, calls attention to the importance of British manufacturers of all classes of products fully appreciating that the India of to-day is a very different country, viewed from the point of view of British trade, from what it was a few years ago. We know in this country the strength of American chemical industry, and there is little doubt that the competition from this quarter will continue and will have to be fought. In addition, the development of the steel industry in India, with its by-product installations, will produce on the spot large quantities of coal tar, benzole, sulphate of ammonia, and other products. The great factor, therefore, to be considered, so far as Indian trade *per se* is concerned—leaving on one side for the moment manufacturing methods in this country with the view of reducing production costs,—is the business methods to be adopted for adequately dealing with trade in India. What are wanted are efficient selling organisations. This is the same advice that has been given for years by our Consular Service and Board of Trade representatives. Broadly speaking, it has never been acted upon in a comprehensive manner, and it therefore comes to-day with greater force than ever in view of the new circumstances brought about by the war. In the past too many British firms have been content to be represented in India by mercantile agents, and so far as principal lines of business are concerned, British manufacturers, who already have a large interest in the market, are advised to open offices and establish selling organisations of their own. Of course, many firms have already done this, with conspicuous success, and that makes it all the more surprising that

a greater number of others have not followed suit. H.M. Trade Commissioner urges that where the trade to be obtained does not warrant a manufacturer going to the extent of maintaining his own organisation, it would be advisable for him to co-operate with some half-a-dozen other manufacturers of non-competing articles and form a group-selling organisation on the spot with a trained staff in charge. We do not doubt that British manufacturers realise that they will have to face much more intense and sustained competition in the future than they have done in the past. Whilst the future of Germany is so uncertain that it may be some years before German competition becomes a force again in India, yet it must not be overlooked that there is not the same intensity of feeling in the East against enemy States as there is amongst the Allies in Europe. Dealers in India do not mind as a rule whether they buy British, American, or German goods provided they are able to get what they want at a low price. The British merchant overseas, also, is to a large extent cosmopolitan, and while naturally he would prefer to distribute British goods, he would, with very few exceptions, readily turn his attention to foreign articles if they showed a greater margin of profit. Bound up with the development of a successful selling organisation, obviously there is the onus upon the British manufacturer of bringing down his costs of production to a competitive level, and to maintain his unexcelled quality. As we have said, competition from America in particular, and also from Japan, will be severer than ever before. Both these countries have developed their shipping, financing, and distributing organisations, and although in the matter of sales the British manufacturer must be guided by the nature of his product as to the method he adopts, in many cases he should visit the country himself in order that he may the better realise how different the India of to-day is, and how much more difficult and complex the problems that have to be faced are, compared with the India of pre-war times.

ANALYSIS OF BASIC SLAG.

MR JOHN HUGHES, Official Agricultural Analyst for Herefordshire, writes: The analysis of basic slag requires special attention, and differences in the results obtained by analysts vary much more than in the case of ordinary raw phosphates, such as Algerian, Gaisa, or Florida.

In order to separate the silica it is absolutely necessary that the original hydrochloric acid solution should be evaporated to complete dryness in a water bath kept at boiling temperature, otherwise the amorphous silica is not rendered insoluble so that it can be removed by subsequent filtration. Unfortunately, however, such evaporation to hard dryness makes the elimination of the phosphoric acid from the residue by exhaustion, even with strong hydrochloric acid, a difficult matter, and it is always necessary again to exhaust the silicious matter after filtration and ignition with more acid, otherwise from 1 to 2 per cent. of phosphate of iron may remain unaccounted for in the residue.

Quite recently a basic slag guaranteed to contain 38 per cent. of phosphate of lime was the subject of a difference of nearly 2 per cent. by analysts operating on duplicate samples, and a third analysis was necessary, the results of which fully confirmed the quality guaranteed.

The writer has found if one gramme of chloride of sodium be added to the two grammes of basic slag taken for analysis, and the hydrochloric acid solution be evaporated to dryness in the usual way, that on treating the hard residue with strong hydrochloric acid, warmed, and then diluted with water before filtration, the elimination of the phosphoric acid from the silicious matter is much more readily and completely effected; so that practically no appreciable quantity of phosphoric acid is left behind in the insoluble residue.

THE PROGRESS OF ANALYTICAL CHEMISTRY.*

By C. AINSWORTH MITCHELL.

(Concluded from page 195.)

Inorganic Analysis.

QUALITATIVE.—Further applications of the use of textile fibres impregnated with reagents in microscopical qualitative analysis have been devised. It has been shown that the difficulties which attend the use of test papers are obviated when a single test fibre is used. For example, a fibre of turmeric viscose silk is a sensitive reagent for boric acid, being capable of detecting 0.000025 milligramme of boron, whilst wool fibres saturated with zinc sulphide are suitable for the detection of traces of copper (0.001 milligramme) and other heavy metals.

A test for iodides in the presence of cyanides has been based on the precipitation of the cyanide by means of cobalt nitrate, and detection of the iodide in the filtrate by oxidation with potassium permanganate in the presence of sulphuric acid and chloroform. Comparative experiments with different oxidising agents have shown that the liberation of iodine from potassium iodide is least affected by cyanides when permanganate is used as the oxidising agent.

A solution of mercuric nitrate in nitric acid may be used for the detection of the sulphuric ion in insoluble sulphates. This reagent forms turpeth mineral, which may readily be identified under the microscope. In the case of mixtures, the sulphate should be precipitated as barium sulphate, and the test applied to the precipitate.

A method of detecting selenium in sulphuric acid depends on the fact that such acid shows a pronounced violet coloration when tested with aspidospermine. Sulphuric acid free from selenium does not show this reaction, but after the addition of an oxidising agent produces a rose-red coloration.

The detection of phosphoric acid by means of molybdic-acid solution is rendered ten times more sensitive by the addition of pyridine to the reagent.

The compounds formed on adding a concentrated solution of potassium iodide to ammoniacal solutions of cadmium and nickel salts afford a means of separating and identifying those metals in presence of other metals. Cadmium forms an insoluble, white precipitate, $\text{Cd}(\text{NH}_3)_2\text{I}_2$, composed of white octahedra, whereas copper gives no precipitate with the reagent. The nickel compound is bluish-violet, has the formula $\text{Ni}(\text{NH}_3)_6\text{I}_2$, and is also composed of regular octahedra. Cobalt forms an analogous precipitate, and should therefore be separated before applying the test for nickel.

On heating for a few minutes a solution containing osmium in the tetroxide condition, or an osmichloride, with an excess of thiocarbamide and a few drops of hydrochloric acid, a coloration is obtained ranging from rose to deep red, according to the concentration of the osmium. The reaction, which is capable of detecting 1 part of osmium in 100,000 is due to the formation of a red compound of the composition $[\text{Os}6\text{NH}_2\cdot\text{CS}\cdot\text{NH}_2]\text{Cl}_3\cdot\text{H}_2\text{O}$.

Other colour reactions which have been described are those given by thorium and zirconium with an aqueous solution of pyrogallolaldehyde. This reagent gives a yellow coloration and precipitate with thorium salts, whilst with zirconium compounds it produces a similar coloration and precipitate after boiling or the addition of hydrogen peroxide. The test is capable of detecting 0.1 milligramme of thorium nitrate in 100cc. The reaction is not produced by pyragallol, pyrogallolcarboxylic acid, or protocatechualdehyde.

Quantitative.—The use of thymolsulphophthalein as an indicator in acidimetric titrations has many advantages, owing to the fact that it shows two distinct changes of colour at different hydron concentrations. It may therefore be used for the differential titration of mixtures of weak and strong acids, such as benzoic and hydrochloric acids, or acetic and sulphuric acids, although in the latter case the error may be as much as ± 0.5 per cent. Another application of this indicator is in the titration of aniline with hydrochloric acid.

A method of estimating the alkalinity of certain liquids, such as soap solutions, has been based on the measurement of the volume of nitrogen which the solution liberates from a nitrosamine. This gives results sufficiently trustworthy for practical purposes, although not so accurate as those

obtained by measuring the pressure of the gas. Nitrosotriacetnamine and nitrosovinylidacetnamine are suitable compounds for titrations within definite limits of hydroxyl-ion concentration.

An acidimetric method of titrating zinc will be found of use when a rapid estimation of the metal is required. The solution, which must contain the zinc in the form of chloride and be free from other heavy metals, is neutralised with sodium hydroxide, methyl-orange being used as indicator, and, after the addition of phenolphthalein, is titrated with $N/10$ -sodium hydroxide solution. The end-point of the titration is indicated by the pink colour not disappearing when the liquid is boiled. The precipitated zinc hydroxide does not interfere with the accuracy of the results.

Several new iodometric methods have been published during the year. For the estimation of copper and iron, advantage has been taken of the fact that the salts of both metals liberate iodine from a solution of potassium iodide in dilute acetic acid. When both iron and copper are present, the former may be precipitated as ferric phosphate, which does not liberate iodine from potassium iodide, and the liquid again titrated. The iodine found in the first titration is equivalent to the copper and iron together, whilst that obtained in the second titration corresponds with the amount of copper. The method is also applicable in the presence of zinc and aluminium.

In another iodometric method of estimating copper, the solution of the metal is nearly neutralised, and the copper converted into cupric acetate. After the addition of excess of sodium thiosulphate and slight excess of potassium thiocyanate, the liquid is filtered from the cuprous thiocyanate, and the excess of thiosulphate in the filtrate titrated with standard iodine solution. Of the common metals, only iron interferes with the estimation.

In estimating sulphites by oxidation to sulphates by means of potassium iodate, it is essential that there should be an excess of the iodate and sufficient hydrochloric acid to prevent the hydrolysis of the iodine chloride formed in the reaction

The excess of iodate is then estimated by means of standard iodine solution. The method may also be used for estimating lead sulphide, which is introduced in a freshly precipitated state into the iodate solution.

In estimating selenious acid by the direct process, it is necessary to add four times the theoretical amount of potassium iodide, to heat the mixture with hydrochloric acid in a distillation flask, and to titrate the iodine both in the receiver and the residue. The indirect method is also trustworthy when a similar procedure is used. Selenic acid is best estimated by reduction with hydriodic acid.

In analysing a mixture of phosphorus, hypophosphorus, and phosphoric acids, a phosphorus acid may first be estimated by determining the iodine absorption of the solution. The hypophosphorus acid is then hydrolysed in the presence of hydrochloric acid in accordance with the equation $\text{H}_4\text{P}_2\text{O}_6 + \text{H}_2\text{O} = \text{H}_3\text{PO}_3 + \text{H}_3\text{PO}_4$, and the resulting phosphorus acid estimated iodometrically as before. Finally, the solution is oxidised and the total phosphoric acid estimated.

For the estimation of hypobromite in the presence of bromate or hypoiodite in the presence of iodate, the hypobromite or hypoiodite is oxidised by means of a mixture of sodium hydroxide and hydrogen peroxide, $\text{NaBrO} + \text{H}_2\text{O}_2 = \text{NaBr} + \text{H}_2\text{O} + \text{O}_2$, the liquid boiled to expel the excess of hydrogen peroxide, potassium iodide and sulphuric acid are added, and the iodine liberated by the bromate is titrated. Another portion of the solution is treated with potassium iodide and sulphuric acid to obtain the iodine equivalent of the hypobromite and bromate together, and the hypobromite is obtained by difference. A method of estimating iodates and bromates in the same solution has been based on the fact that bromates are gradually decomposed by dilute hydrochloric acid with the formation of hydrobromic acid and hypochlorous acid, whilst iodates are not affected. The iodine equivalent of the two compounds together is obtained as described above. Another portion of the solution is then treated with dilute hydrochloric acid, and subsequently oxidised with hydrogen peroxide and sodium hydroxide, and the iodine equivalent again determined. The difference

* Abstracted from the Chemical Society's "Annual Reports on the Progress of Chemistry for 1918."

between the amounts obtained in the two titrations corresponds with the bromate.

An iodometric method of estimating nitrites has been based on the reaction $\text{NaNO}_2 + 2\text{HI} = \text{NaI} + \text{I} + \text{NO} + \text{H}_2\text{O}$, which is carried out in a series of connected flasks. The liberated iodine is titrated with arsenious acid.

In this connection, mention may also be made of a general method of estimating iodine in inorganic and organic compounds, based on its conversion into iodine trichloride. The iodine liberated in the reaction, $6\text{FeSO}_4 + 3\text{H}_2\text{SO}_4 + 2\text{ICl}_3 = 3\text{Fe}_2(\text{SO}_4)_3 + 2\text{I} + 6\text{HCl}$, is extracted with chloroform and titrated with thiosulphate solution.

An oxidimetric method of estimating thorium has been described. The thorium is precipitated as oxalate, and the precipitate heated at 85° with dilute sulphuric acid, and titrated first in the cold and finally at 85° with standard potassium permanganate solution. If a known excess of oxalic acid has been used for the precipitation, the filtrate may be heated to 85° and titrated with permanganate. An extension of the method may also be used for estimating fluorine. The fluoride is precipitated as thorium fluoride by means of an excess of thorium, the excess of which, in turn, is precipitated as thorium oxalate.

Metallic silver may be used as a reducing agent in the volumetric estimation of iron, the dissolved silver being subsequently precipitated as thiocyanate. The filtrate is treated with an excess of silver nitrate and titrated with potassium permanganate solution. The presence of titanium does not affect the results, but vanadium is quantitatively reduced by silver. Titanous chloride may also be used as a reducing agent for ferric salts, the excess being subsequently removed by means of copper sulphate.

It has been pointed out that in titrating potassium permanganate solution containing nitric acid with sodium arsenite, the latter has a reducing value considerably in excess of that shown when no acid is present. It is probable that a manganic compound is formed under these conditions.

To obtain trustworthy results in the titration of chlorides by Volhard's method, the liquid should be stirred at the first indication of change of colour, and the titration then completed. Thiocyanates, if present, should be oxidised with sodium peroxide in sulphuric acid solution before the titration. In using the method conversely for the estimation of silver, the presence of other metals, such as mercury, lead, nickel, or cobalt, or of lower oxides of nitrogen, causes the results to be inaccurate. The use of palladium iodide as indicator renders the method more trustworthy and sensitive and capable of being used in the presence of the substances mentioned. The addition of a small amount of gum arabic is advisable to prevent the precipitation of silver or palladium iodide during the titration.

A volumetric method of estimating chlorides, bromides, and cyanogen consists in titrating the solution with standard mercuric nitrate solution, using sodium nitroprusside as indicator. The results are more accurate than those obtained by Volhard's method, and the method can be used in the presence of sulphates and phosphates, although sulphites and nitrites must be removed before the titration. Conversely, the method is applicable to the estimation of mercury.

The presence of dissolved or gelatinous silica does not interfere with the titration of chlorine with silver nitrate, provided that the liquid is made neutral to phenolphthalein with nitric acid, and any resulting gelatinous mass is finely distributed throughout the liquid before introducing the reagent.

One objection to the method of titrating copper with potassium cyanide solution is that the end-point of the reaction is no longer sharp when much less than 1 gramme of copper per litre is present. For smaller quantities, a volumetric method has been based on the fact that a solution of a double carbonate of copper and an alkali metal in excess of sodium carbonate solution gives a sharp reaction with potassium cyanide. The double carbonate is prepared by adding a solution of sodium carbonate and sodium hydrogen carbonate to the copper solution.

The results obtained by the volumetric method of estimating lead by means of ammonium molybdate, as ordinarily used, are too high. To obviate this, it is essential to dissolve the lead sulphate in the smallest possible quantity of ammonium acetate solution.

Calcium may be estimated volumetrically by precipitating it under specified conditions with an excess of ammonium oxalate, the excess of which is subsequently titrated in the filtrate by means of potassium permanganate solution.

Turning to the gravimetric methods, it will be found that several new methods of separating metals in different groups have been described. For example, for the separation of copper, zinc, cadmium, nickel, and cobalt, the metals are precipitated by means of sodium carbonate, the precipitate is dissolved in the minimum quantity of ammonia solution, and the liquid diluted and boiled until reprecipitation is complete. The precipitate may be an oxide, as in the case of copper, a hydroxide or hydrocarbonate, as in the case of zinc and nickel, or a carbonate, as cadmium carbonate. The precipitate is ignited, or sometimes is preferably reduced with hydrogen, and the metal weighed. For the separation of individual metals, modifications of various well-known methods may be employed.

Another new method is concerned with the separation of metals of the copper group from those of the arsenic group. It is based on the facts that the sulphides of mercury, arsenic, antimony, and tin are soluble in a solution of sodium hydroxide saturated with hydrogen sulphide, and then mixed with a more concentrated sodium hydroxide solution, whereas the sulphides of lead, bismuth, copper, and cadmium are insoluble therein.

Dicyanodiamide sulphate is a convenient reagent to use for the quantitative precipitation of copper or nickel when it is desirable not to use an alkali hydroxide. It may also be used as a group reagent for separating copper and nickel from zinc, aluminium, arsenic, lead, and antimony.

The use of hydrofluoric acid in electrochemical analysis is mentioned elsewhere. A further application of this reagent has been based on the fact that stannic tin and tungsten are not precipitated by hydrogen sulphide from an acidified fluoride solution, and may thus be separated from copper, lead, silver, mercury, antimony, and arsenic.

The accuracy of the results obtained by estimating sulphuric acid as barium sulphate depends to a considerable extent on the rate at which the barium chloride is added, whilst other factors, such as the concentration, the amount of stirring, and the acidity of the liquid have a much smaller influence. At least one and a-half minutes should be allowed for the addition of the reagent. In the presence of potassium salts, the results are too low, but tend to compensate the high results caused by a too rapid addition of barium chloride.

Gravimetric methods of estimating chromates and dichromates as barium chromate and as silver chromate have been described. In each case, the insoluble chromates are precipitated and washed under specified conditions, dried at 132° , and weighed. The silver method is the more trustworthy, but is not applicable in the presence of chlorides, whilst the barium method cannot be used in the presence of sulphates. Nitrates, chlorates, and acetates do not affect the results, but even when the silver method is used, sulphates cause the results to be too high.

A similar method has been devised for the estimation of strontium, which is precipitated as sulphate, carbonate, or oxalate, preferably the last. In each case, the precipitate is washed with a saturated solution of the respective strontium salt, dried at 132° , and weighed. It should be noted that magnesium chloride interferes with the estimation as oxalate. For the separation and estimation of barium when associated with strontium, the saturated solution of the two chlorides is treated with a mixture of hydrochloric acid and ether, and the precipitated barium chloride washed with the same mixture, dried at 150° , and weighed.

For the estimation of magnesium, the compound $\text{MgNH}_4\text{PO}_4 \cdot 6\text{H}_2\text{O}$ is precipitated at 90° , washed with ammonia and methyl alcohol, dried over calcium chloride, and weighed. The method cannot be used, however, when any considerable quantity of potassium chloride or sodium chloride is present.

Several new methods of separation by means of volatilisation have been published. When tantalum is precipitated as tantalum acid, the silica which is usually present cannot be separated by treatment with hydrofluoric acid without some loss of tantalum. To obviate this difficulty, the tantalum acid may be volatilised in a current of hydrogen chloride at 900° , and the residual silica weighed.

Other volatilisation methods have been devised for vanadium, molybdenum, and tungstic acid. In the case of vanadium, the compound is heated in a current of carbon dioxide and carbon tetrachloride in a silica tube, and the resulting vanadium chlorides collected in dilute nitric acid and water. The vanadic acid is then reduced to vanadyl sulphate, and the solution titrated with standard permanganate solution. Molybdenum compounds are volatilised

at 400–560° in carbon tetrachloride vapour, and the volatilised molybdic acid is collected, evaporated with nitric acid, and weighed. For the volatilisation of tungstic acid, a current of carbon dioxide saturated with carbon tetrachloride vapour is used, and the separated acid treated as in the case of molybdic acid.

The new colorimetric methods include one for the estimation of manganese, which depends on the oxidation of manganese salts by means of an alkali periodate in acid solution, and comparison of the resulting permanganate with standard solutions. Tungstic acid may also be estimated colorimetrically by reducing it by means of titanous chloride, and comparing the blue oxide which remains in suspension under certain conditions with standard suspensions of known composition. The method is not applicable in the presence of vanadium, phosphorus, or molybdenum, and these if present must be removed prior to the estimation.

Electrochemical Analysis.

Further applications of the electrometric method of titration have been described during the year. For example, it is a convenient method of estimating manganese in steel. For this purpose, the manganese is oxidised to permanganate by means of sodium bismuthate or ammonium persulphate, and the resulting solution titrated with mercurous nitrate solution. The presence of chromates or vanadates does not interfere with the estimation. Another modification of the method has been devised for the titration of solutions containing proteins, a special apparatus being used to prevent local reactions when the reagent first comes in contact with the solution.

On titrating oxalic acid with sodium hydroxide solution, a sharp change occurs in the electrical conductivity of the liquid at the moment when the first hydrogen atom is displaced by sodium. Should, however, the sodium hydroxide contain carbonates, the results obtained in the estimation of oxalic acid will be too high. By means of this method, it is also possible to titrate strong acids in the presence of weaker acids.

An apparatus has also been devised for measuring the density and the amount of salts in a liquid by means of its electrical conductivity at a definite temperature. The current is derived from two electrolytic cells connected with an alternating current galvanometer and a recorder. A method of this sort should prove useful for following the progress of concentration of liquids being evaporated.

A method of estimating vanadic acid has been based on its reduction in the presence of sulphuric acid by means of anodes of silver or copper in rapid rotation in an electrolytic cell, or by means of a rotating cylinder of zinc. Over reduction is prevented by the addition of silver sulphate, and the completion of the reduction is shown by the appearance of metallic silver. The liquid is then filtered and the vanadium estimated by titration with potassium permanganate. The best results are obtained by the use of silver plated with pure copper.

It has been found that hydrofluoric acid is a useful reagent for electrolytic separations. For example, copper can be quantitatively separated from vanadium, tin, or tungsten and electrolytically deposited from an acid fluoride solution. Uranium and titanium behave in the same way as vanadium. The stannic ion does not appear to be present to any notable extent in acid fluoride solutions of stannic tin, but on adding boric acid to the solution, the tin may then be separated either electrolytically or by means of hydrogen sulphide.

By fractional electrolysis of a dilute solution of the sulphates of gallium and iridium, it is possible to separate the gallium in a pure condition, but it is necessary to repeat the electrolysis about fourteen times.

Water Analysis.

The introduction of rapid methods of examining water for the use of armies in the field has been one of the features of recent work in this branch of analysis. For the rapid determination of the hardness of water on the spot, Blacher's method of titration with potassium palmitate is in general the most suitable, and the reagent is prepared for the purpose in the form of standardised pellets.

It has been found that Wartha and Pfeiffer's method of estimating the hardness is rendered more trustworthy, especially in the case of waters rich in magnesium salts, by increasing the amount of sodium carbonate to 14.5 grammes, and that of the sodium hydroxide to 8.01 grammes, per litre.

A suggestion has been made that the hardness of water might be estimated by measuring the increase in the surface

tension after the addition of calcium or magnesium salts to an alkaline soap solution.

For the rapid estimation of magnesium in water, an alkalimetric method has been devised. The water is rendered neutral to methyl-orange and treated with potassium oxalate in slight excess of the amount equivalent to the calcium present, and then with a measured excess of a mixture of standard alkali hydroxide and carbonate solutions. The liquid is then made up to definite volume and filtered, an aliquot part of the filtrate treated with an amount of calcium chloride equivalent to the excess of potassium oxalate used, and the excess of alkali titrated.

In the colorimetric estimation of lead in water, the salts present have a considerable influence on the intensity of the colour reaction. To obviate this, it is necessary to prepare the standard lead solutions for the comparison from the same water which has previously been freed from lead. Comparisons made with standards prepared from distilled water may give results much too low.

A colorimetric method of estimating minute quantities of vanadium in water has been based on the fact that diphenylamine gives a violet coloration with aqueous solutions of vanadium compounds acidified with hydrochloric acid. The test is capable of detecting 0.002 per cent. of vanadium, and is not affected by small quantities of iron, titanates, or nitrates, but in the presence of free nitric acid the method would require modification. For a quantitative estimation, the colour may be compared with that given by solutions containing known quantities of ammonium vanadate.

In Riegler's colorimetric method of estimating phosphoric acid in water, the hydrazine sulphate may conveniently be replaced by stannous chloride.

A new colorimetric method has also been devised for the detection of nitrites in water. The sample is treated first with antipyrine solution, then with mercuric sulphate solution, and finally with a few drops of potassium ferricyanide solution, a red coloration being produced in the presence of a trace of nitrite. The test is also applicable to nitrates after reduction to nitrites.

FERTILISER SCARCITY.

DR. E. J. Russell contributes to the August *Journal* of the Board of Agriculture an interesting summary of the work carried out at Rothamsted Experimental Station, near Harpenden. He explains that in the earlier years of the war there were not many important matters which required to be investigated, but in 1916, when the food problem became acute, methods of dealing with the situation were closely studied, and much valuable information was gained. For instance, the limitation of the amount of fertilisers available to the farmer was a serious matter. The production of sulphate of ammonia fell from 350,000 tons per annum to a little over 250,000 tons, while superphosphate fell from 800,000 tons to 500,000 tons. A substitute for sulphuric acid was provided in the form of nitre-cake, but the fertiliser manufacturer did not like it. A working solution of the problem, however, was found, and Dr. Russell adds that "there is little doubt that both sulphate of ammonia and superphosphate could have been made from nitre-cake had the necessity arisen." The situation eased, however, before it became too serious. The difficulty of obtaining potash and securing an efficient substitute was one of the urgent questions. Residues from manufacturing processes were available, but they chiefly suffered from one or two, or both, of two defects, low content of potash and the presence of toxic substance. After sorting out, blast furnace flue-dusts were regarded as likely to prove most suitable, and arrangements were made for distribution. Considerable quantities have been used, and generally with distinct advantage.

Then the elimination of loss in the manure heap through avoidable causes was carefully investigated, and the conditions which make for success are stated to be protection from rain and efficient storage. A new process by which sewage sludge can be used is being studied, as it gives a sludge containing 6 per cent., or more, of nitrogen in an easily available form. Before its agricultural value can be established, however, there are many problems to be studied, and work is now going forward. Other aids to production, such as a close study of calcium cyanamide and ammonium nitrate, may yield good results, and naturally, in view of the importance of basic slag in modern farming, considerable attention is being devoted to it.

IMPORT RESTRICTIONS ON CHEMICALS.

WITH reference to the Prime Minister's statement in Parliament last week on the subject of trade policy, the Board of Trade make the following announcement as to the steps which are proposed in connection with imports of goods from abroad.

Legislation will be introduced when Parliament reassembles in the autumn:—

(a) For the protection of goods manufactured in Great Britain and Ireland against dumping by taking power to prevent the sale in this country of similar goods beneath their price in the country of origin.

(b) To enable the Board of Trade to check any flood of imports (for instance from Germany) that might arise from a collapse of exchange so disproportionate to costs of production in the country of origin as to enable sales to take place in this country at prices altogether below costs of production here.

(c) To deal with unstable "Key" industries in the following way:—

A limited number of unstable "Key" industries will be scheduled, the products of which will be prohibited from importation into this country except on licence.

Pending legislation, a general license under the Prohibition of Import Proclamations will be issued by the Board of Trade having effect as from September 1, 1919, and authorising the importation into the United Kingdom of all goods with the exception of those in the following list, which will be treated as unstable "Key" industries:—

(1) All derivatives of coal tar generally known as intermediate products capable of being used or adapted for use as dyestuffs or of being modified or further manufactured into dyestuffs. All direct cotton colours, all union colours, all acid colours, all chrome and mordant colours, all alizarine colours, all basic colours, all sulphide colours, all vat colours (including synthetic indigo), all oil, spirit and wax colours, dyes, stains, colour acids, colour lakes, leuco acids, leuco bases whether in paste, powder, solution, or any other form.

(2) (i) Synthetic drugs (including antiseptics.) (ii) Synthetic perfumes and flavourings; synthetic photographic chemicals; synthetic tannins; esters and acid derivatives of aromatic hydrocarbons; alkaloids and their salts (except quinine); and the following organic chemicals:—Acetamide; acetic acid; acetic anhydride; acetyl chloride; camphor bromide; cinnamic acid and its salts; ethylene bromide; formamide; formic acid and its salts; gallic acid; lactic acid and its salts; nuclein; paraldehyde; pyrogallol; saccharine or other substances of like nature or use; salicin; thymol. (iii) Analytical re-agents; and the following fine chemicals:—Barium compounds; cerium fluoride and fluorides of other rare earth metals; hydrosulphites and allied bleaching compounds; hypophosphorus acids; iron and ammonium citrate; iron tartrate; molybdic acid and its salts; phosphorus oxides and halogen compounds; salts of per acids and artificial peroxides; silver nucleinate and proteinate; tungstic acid and its salts.

(3) Optical glass including lenses, prisms and like optical devices.

- (4) Scientific glassware.
- (5) Illuminating glassware.
- (6) Laboratory porcelain.
- (7) Scientific and optical instruments.
- (8) Potassium compounds.
- (9) Tungsten powder and ferro-tungsten.
- (10) Zinc oxide.
- (11) Lithopone.
- (12) Thorium nitrate.
- (13) Gas mantles and mantle rings.

It is not proposed to make any addition to the above list unless and until Parliament so determine, with the possible exception that in the event of the contingency foreshadowed in paragraph (b) above arising it might be necessary to suspend temporarily all or any of the imports from the country affected by the collapse of exchange.

CHARCOAL BRIQUETTES.—The Forest Research Institute of India is making experiments on the manufacture of charcoal briquettes, but is handicapped by lack of a suitable binding material.

SOME CHEMICALLY REACTIVE ALLOYS.*

By E. A. ASHCROFT.

AN alloy of 15 per cent. of pure magnesium with 85 per cent. of pure lead has the remarkable property that upon exposure to moist air oxidation of both the magnesium and the lead proceeds so rapidly that a lump of alloy so exposed swells up and falls to a black powder in a single night, or in some instances even in an hour or two. The reactions to this point may be expressed thus:—

from which it will be seen that both water vapour and oxygen take part and that hydrate of magnesium and sub-hydrate of lead are the products formed.

On more prolonged exposure the finely divided sub-hydrate of lead will pass over completely into the hydrate $\text{PbO}_2 \cdot \text{H}_2$ with a corresponding change of colour. However, a much longer period at ordinary atmospheric temperature is required for this second stage of oxidation. Oxidation of the sub-hydrate of lead to the hydrate can be accelerated by the addition of water to the powder, the oxidation then going on quite rapidly, and as this oxidation is accompanied by an evolution of hydrogen it would appear that it is entirely due to water vapour. Shaking up the oxidised alloy in water in which carbon dioxide has been dissolved produces a very nice quality of white lead, and this application of the alloy may prove industrially useful.

The author proceeded to demonstrate the entirely different behaviour of the alloy at atmospheric temperature in the presence of ordinary moist air and in the presence of reasonably dry air. In the latter case the reaction does not take place. In this experiment is indicated a ready means of producing nitrogen or nitrogen and hydrogen mixtures from these alloys, or of removing remainders of oxygen from various mixtures in the cold. Such a method may find many industrial uses.

Another application of the alloys might possibly be the production of hydrogen alone, which takes place readily and quantitatively by boiling the powdered alloy in water. This method of producing gases, although it cannot hope to compete with the larger established methods economically in the best situations, has a great advantage in that the gases can be produced very readily where wanted, and for transport purposes to a great distance (as compared with cylinders) there is very great saving of weight shown.

For the production of hydrogen a 30 per cent. Mg alloy is best, whereas for the atmospheric oxidation previously described the maximum effect is obtained with about 15 per cent. alloy, and with about 30 per cent. on the one hand and 10 per cent. on the other the effect becomes much slower or ceases altogether.

Still another alloy of some interest is the eutectic Mg Zn. This alloy possesses very different properties, inasmuch as it can be pounded fine, passed through a 100-mesh sieve, and exposed to the air almost indefinitely without oxidation. It is likely to find industrial application in connection with the removal of gold from cyanide solutions, as well as for pyrotechnic purposes.

A few words were added regarding the manufacture of these alloys, and it was shown that the cost of the alloys became largely a question of the cost of anhydrous magnesium chloride.

From the figures given it was shown that under favourable conditions in regard to cost of energy there is no reason why magnesium lead alloys or magnesium zinc should not be produced at prices not greatly in excess of the cost of the basic metals, lead and zinc. Such results, however, were dependent for their realisation upon the opening of sufficiently large markets to make it worth while to carry out the operations on a fairly large scale.

In the course of the discussion Dr. J. A. Harker, F.R.S., suggested using the method for removing oxygen contaminating the hydrogen used for balloons.

Dr. E. Rideal thought the action a catalytic one based on electrolytic processes, similar to the behaviour of iron in removing small traces of chlorine from water.

Dr. H. C. Greenwood said the method might be useful in preparing argon from commercial oxygen.

* Paper read at a recent meeting of the Faraday Society.

INDUSTRIAL RESEARCH.

THE Department of Scientific and Industrial Research has favoured us with an official report of a Conference of Research Organisations held at the offices of the Board of Education in London, on July 29. Sir William McCormick (Chairman of the Advisory Council) presided in the absence of the Right Hon. H. A. L. Fisher, M.P.

Sir William McCormick in opening the proceedings, said: The reason for calling this meeting to-day is that there are one or two matters which have cropped up, some of which have arisen from the side of the Associations, some of them have been difficulties which the Government have felt, but I am sure they are all matters on which we would like mutual enlightenment. The first of these is an obvious one, the formation of a Records Bureau. The second head is with regard to the conditions of employment of research workers by research associations. The third head, co-operation amongst research associations for the study of accessory materials or equipment, is one that has cropped up here and there in the course of the work of the new Research Associations already formed.

Mr. A. P. M. Fleming (British Westinghouse Company): I think that in the memorandum which the Department have prepared relating to this question of the formation of a Records Bureau, they have adopted the very wise policy in the first place of limiting their efforts to what they can economically handle to make sure that their information is reliable and also, as we express it, deal with this particular part of the problem efficiently. I should rather have liked to see some extension of this work, which is at present to be confined, as I understand, to the handling of records principally from research associations. In addition to becoming a Records Office for the fruits of industrial research from these different associations operating as finished records, I should like also to see some attempt made to collect the side lines, shall I say, of research. There very valuable data which often arise in the pursuing of some research to a conclusion and which may be only incidental to the research itself, are often of a very fleeting kind, and unless they are recorded in some fashion may be lost altogether. It is often extremely valuable information and so I conceive an organisation such as is proposed dealing also with other things.

Mr. Conrad Beck (British Scientific Instrument Research Association): In the formation of our Association it was pointed out that the results of research would be retained for the benefit of the members of that Association, except in such cases where the Department might decide that it was of national importance that they should be disclosed. I think that our members as a whole are under the impression that the researches to be worked out in our Association will be, at any rate in the first instance, their property, and that raises the somewhat delicate question of how this Bureau would deal with work which has been originated by individual research associations. Of course one can quite well see that there will be a great many cases which will be of equal interest to entirely different trades, and some sort of communication between the research associations would undoubtedly be essential to prevent an enormous amount of overlapping of work.

Mr. H. L. Heathcote (British Non-Ferrous Metals Research Association): I am continually being faced with the need of reading the originals of works of research. At present it is only with the greatest difficulty that one can obtain sight of originals, and I believe that this Bureau, if it could secure for the advantage of research workers the sight of original works, whatever they might be, would be a very great advantage.

Sir Frank Heath, K.C.B. (Secretary of the Department of Scientific and Industrial Research): Mr. Beck mentioned the very important question of the ownership of results by research associations. We have declared officially that the ownership in scientific results is that of the members of the association; the association holds that property in trust for its members. Accordingly the Records Bureau will be organised in two sections, a confidential section and a non-confidential section. We shall ask research organisations, in forwarding us information, to indicate which part of the information they consider confidential and which they do not consider confidential, and any information in the confidential section of the Bureau will be communicated to nobody at all without agreement with the body that sends it. But Mr. Beck realises, as we all realise, that sometimes this confidential information may be of great value to another

research association, and it might be quite easy to negotiate the transference of that information to another association on reasonable terms. Then Mr. Heathcote has spoken about the need for getting at original papers. On that, of course, we must never forget that it is a primary duty of a research association to have its own library and its own records bureau. It is not intended that the central organ shall relieve the association from collecting their own information and from having their own library. At the same time anything that the Department through the Records Bureau can do to help research associations to get a sight of scarce or rare publications I can assure you they will do. It will be the duty of the Bureau rather to draw attention to original sources of information than to send *precis*. I think that we could do a good deal in that sort of way. We shall naturally get to know of new sources of information, and as we get the information we shall send those new sources to the associations. I fancy that that would be more useful than attempting to send *precis* of papers.

Sir Herbert Jackson, F.R.S. (Scientific Instruments Research Association): I think there may be a little misapprehension, perhaps, as to the value it will be to have this confidential information with the Department of Scientific and Industrial Research; but those who remember the very early days of the war when we were so anxious that some Department of the kind should be brought about will recognise that it was held by a great number of scientific people that there should be some body set up which should be a kind of trustee of progress and activity on the subject of research. It may be—it is not yet—that such a Department will be utterly unnecessary in twenty years more or less, because the objects to be gained by research will be so well recognised that every industry will, of course, consider research as almost its primary duty. At present I think that the confidential information does not need to circulate but should be collected, because one of the chief things which we hope from the Department of Scientific and Industrial Research is that it will be keeping a watchful eye on the whole amount of national research and will know, because it has this confidential information, what is going on, and will be in a position to spur on others who are not doing what ought to be done, and look after the work which is being done in industry and survey the whole field. But the principle which Sir Frank Heath has suggested of circulating information is one which is perfectly sound. When they have these pieces of information in the Department they can easily see, with the experience of a year or two, or a month or two, what it would be advisable to circulate. In the Association I have to deal with, we are faced at once with the problem of a certain thing which has been made and discovered being, we hope, of value to another industry. How far the whole details of the research are to be communicated to the other industry is a matter for the research association with which I am connected. When the Department gets that information it knows how to act, and in that way I do not think there need be any fear that the confidential information will be lost and wasted.

Mr. J. P. Hinchcliffe (Woolen and Worsted Research Association): The first proposition that I want to lay down is this—that the success of our various endeavours in the different fields of research will depend very largely on the generosity and fairmindedness with which we treat our agreements with research workers, and I am perfectly certain that unless we do make those agreements absolutely fair as between the association and our workers we are doomed to failure. The first standard I should lay down there is that we should pay such a salary as to put the investigator in such a position that he has no family anxiety; otherwise his mental effort is detracted from, and he cannot give the best service to our work.

Sir H. Jackson, F.R.S.: May I as a director say that when the idea of some kind of bonus being given to research workers came before me, I viewed it with consternation. I think it would be impossible for a director to carry out his work under those circumstances. The only way is to remember that when you get a good man you should pay him well, and when you have got your good man give him a feeling of security of tenure by increasing his salary.

Sir Frank Heath: When the model articles were drawn up for Associations, provision was made for co-operation between Research Associations, but we had rather vague notions as to the way in which this co-operation should actually take place. Since then it has been suggested that the best procedure would be the appointment of Joint Committees which might include representatives of a number of Associations, and that these Joint Committees should have specific prob-

lems referred to them and that by agreement between the various Associations contributions from those Associations should be made with which the researches could be financed. Refractories, so I understand, is a subject which is of very great interest to a large number of industries who use refractories, as well as to the industry which makes refractories. Now if a Research Association for refractories, consisting in the main of manufacturers of refractory materials, comes into existence, I take it that that Association will not really be successful in attacking the very large number of problems which we have to attack; refractories for glass, refractories for steel, refractories for non-ferrous metals, refractories for gas, refractories for pottery—there is an enormous range of industries which use refractory materials in one way or another. If that Association is going to be successful, somehow or other it has got to be in the very closest touch with the industries which use the refractories. One of the Associations which is just about to come into existence is the Glass Research Association, and refractories bulk very large in their problems. It has been suggested to me that the best way of dealing with refractories for glass is to have a Joint Committee of the Glass Research Association and the Refractories Research Association working out refractories specifically from the point of view of the different industries. Now refractories happens to be a subject which will force, I think, the new Association into very close relationship with a whole ring of other Associations, but quite apart from refractories, there must be a number where two or more research associations are directly interested in something which, though it is not the main product of the industry, is yet of very great importance in one or other of their processes and which appeals in that way to more than one industry. The suggestion I want to throw out is that you should set up these committees *ad hoc* and then learn by experience whether that is the most successful way of proceeding.

THE FARADAY SOCIETY.

THE ninety-third ordinary meeting of the Faraday Society took place recently in the rooms of the Chemical Society, Burlington House, London. Professor Alfred W. Porter, F.R.S., Vice-President, was in the chair.

Mr. F. H. Jeffery, M.A., read a paper entitled

"The Electrolysis of Solutions of Sodium Nitrate Using a Silver Anode."

The anode was of Stas silver, the cathode was of platinum, and was hung in a porous pot, the anolyte was stirred rapidly. The sodium nitrate was of 98.6 per cent. purity, the rest being nitrate. Solutions of concentrations from 70gms. to 10gms. sodium nitrate per 100 gms. water were examined.

No silver was deposited on the cathode; at the anode a yellow solution containing a silver complex was formed, no gas was evolved but a film formed on the anode consisting of silver nitrate and a small percentage of finely divided silver. The presence of sodium nitrate in the anolyte did not affect the reaction, the addition of 10gms. sodium nitrate to 100 c.c. of an anolyte of 30gms. sodium nitrate per 100gms. water did not cause a deposition of silver on the cathode and measurements of the anode potential showed that the reaction at the anode was not affected.

Measurements of the rate of work involved in the transfer of electricity from the anode to the liquid in contact with it showed that the nature of the reaction at the anode remained constant throughout the electrolysis and also that it was unchanged by raising the anode potential and increasing the current density.

From the yellow anolyte crystals of $\text{Na Ag}(\text{NO}_2)_2$ were isolated.

A paper by Mr. W. E. Forsythe, of the Nela Research Laboratory, Cleveland, U.S.A., on

"The Disappearing Filament Type of Optical Pyrometer,"

was presented by Dr. Ezer Griffiths, who exhibited some of the instruments described in the paper.

The paper discussed fully the principles that determine the accuracy and use of this type of pyrometer, which appears to be used more widely in America than here. The instrument is practically a telescope with a lamp filament at the focus of the objective, in series with a battery resistance and ammeter. The instrument is sighted on the hot body in such a manner that the image of the filament crosses that of the body. The current is then adjusted until the filament is

just as bright as the body sighted. A red glass in the eyepiece eliminates difficulties due to colour differences. The pyrometer as made was described.

The matters next considered included the monochromatic screen, the calibration of the pyrometer, the carbon filament, the temperature of, and emissive power and wave-lengths emitted by non-black bodies, absorbing screens, and other questions concerned generally with optical pyrometry.

Mr. C. C. Patterson considered the paper very helpful and the type of pyrometer described a very interesting one.

Mr. A. G. Tarrant spoke of the accuracy attainable with the pyrometer which was very reliable. He asked for further information on the effect of screens, which he had found negligible. This freedom from error made the instruments very useful in awkward situations, and an example of its adaptability was given.

Professor Alfred W. Porter, D.Sc., F.R.S., read a paper

"On the Equation for the Chemical Equilibrium of Homogeneous Mixtures. Part I. Equilibrium at Constant Temperature."

The general equation for chemical equilibrium is obtained in a way which is so much less abstract than the method of depending upon the thermodynamic potential that no dubiety need exist of the meaning of the result and the conditions under which any particular form of it applies. The result is expressed in terms of the pressures of the constituents when isolated and in osmotic equilibrium with the mixture through membranes each permeable to one alone of the constituents. The method employed is, essentially, the same as that of Van't Hoff (the "equilibrium box" method) but it is employed for the first time for other than perfect-gas mixtures. In the general case even the meaning of the term "partial pressure" has to be defined, because the additive law does not hold good. It is defined, as in other osmotic phenomena, as the pressure of the particular constituent when in osmotic equilibrium with the mixture. The general equation is put into different forms to suit simple deviations from the perfect gas law.

Mr. Irving Langmuir sent in a paper on

"The Mechanism of the Surface Phenomena of Flotation,"

which was communicated by Mr. E. Hatschek.

The paper called attention to a theory of absorption and surface tension which greatly aids in understanding the phenomena of flotation. Experiments were described which show that oil films of molecular thickness are sufficient to alter radically the surface of solids. The conditions under which froth is formed were discussed, and it was considered that the selective action by which substances like galena are separated from quartz and calcite is dependent upon the contact angle formed by the oiled surfaces rather than by any selective tendency on the part of the oil. The necessity for further researches was urged.

THE BRITISH ASSOCIATION.

THE annual meeting of the British Association will be opened at Bournemouth on Tuesday, September 9, after an interval of three years, the last gathering taking place at Newcastle-on-Tyne in September, 1916. In his presidential address to Section B, Chemistry, Professor P. Phillips Bedson, of Armstrong College, Newcastle, will discuss the periodic law of Mendeleeff and the position of chemists in relation to industries. Succeeding him, Professor Sir William Pope, General H. Hartley, Lieutenant-Colonel C. D. Crozier, and Professor Boswell will contribute papers on Chemistry during the War, Chemical Warfare, High Explosives, and Geochemistry during the War. Communications from the Holton Heath Cordite Factory, by Dr. Thayne on Bacteriology and its Application outside Medicine, and by Mr. J. Reilly on Distillation of Organic Compounds and on Inter-molecular Rearrangements, etc., will in a way be preparatory to the visit to the Factory. Of the remaining papers the report of the Fuel Committee, and Dr. R. Lessing on the Chemistry of Coal Tar will interest the engineer. The other papers by Drs. Lowry and Perman on Equilibria; by Professor E. C. C. Baly on The Molecular Phase Hypothesis, a Theory of Chemical Activity; by Professor A. Lapworth on The Positive and Negative Rule in Organic Researches, and by Professor R. Robinson on Conjugation of Partial Valencies are of theoretical interest.

CARBIDE CONVERSION CALCULATIONS.*

BY ISMOND E. KNAPP.

IN carrying on experimental work in connection with the manufacture of calcium carbide, considerable time was consumed in making the necessary calculations. Changes were being made in the design of the furnace, and it was important to know the efficiency of conversion that was obtained in each run. Inasmuch as the quality of the coke and lime varied considerably, this calculation was rather tedious. In order to simplify it, the following method was worked out, and it has proved entirely satisfactory.

The reaction may be represented by this equation:—

Analysis shows that the crude carbide or furnace product contains only a small amount of free carbon (seldom over 1.0 per cent.) and but very little sulphur. These small amounts are neglected in these calculations, and it assumed also that all of the constituents in the coke ash and the impurities in the lime (such as SiO_2) go through the carbide furnace unchanged, and are present in the furnace product. On this basis the furnace product will have only the following constituents:—

- (1) Calcium carbide.
- (2) Coke ash.
- (3) Lime impurities.
- (4) Unchanged lime.

Let A = decimal fraction fixed carbon in the coke.

B = decimal fraction ash in the coke.

C = decimal fraction CaO in the lime.

D = decimal fraction loss on ignition of the lime.

Then, $1 - A - B$ = moisture + volatile + sulphur in the coke, and $1 - C - D$ = impurities in the lime.

It is evident from the above equation that the theoretically correct proportions for a mixture of lime and coke are:—

$$\frac{36}{A} : \frac{56}{C}$$

In case the proportions actually used are not the theoretical, care must be taken that they are calculated to the above form, and that only the factor 36 is affected. For instance, if a small excess of carbon were used, this factor might become 37 or 38. It can be determined easily by solving this proportion:—

$$\frac{\text{lb. lime used} \times C}{\text{lb. coke used} \times A} = \frac{56}{X}$$

whence, X = the factor to be used in place of 36 in all of the following formulae.

Assuming that the efficiency of conversion, E, is known, then the weight of CaC_2 in the furnace product from a coke-lime mixture of the above composition will be 64E. The weight of the coke ash will be $\frac{36}{A} B$; the weight of the

impurities from the lime will be $\frac{56}{C} (1 - C - D)$; and the

weight of the unchanged lime will be $(1 - E) 56$. The corresponding amount of unchanged carbon, $(1 - E) 36$, apparently is burned, and so does not appear in the furnace product. Now, if F represents the total weight of the furnace product, we may write:—

$$F = \text{carbide} + \text{ash} + \text{dead lime} + \text{excess lime} \\ = 64E + \frac{36B}{A} + \frac{56(1 - C - D)}{C} + (1 - E) 56 \quad (1)$$

The purity of the furnace product, P, is, of course, the ratio of the weight of CaC_2 in the furnace product to the total weight of the furnace product—i.e.,

$$P = \frac{64E}{F}$$

or, substituting the above expression for F,

$$P = \frac{64E}{64E + \frac{36B}{A} + \frac{56(1 - C - D)}{C} + (1 - E) 56}$$

By rearranging this equation we finally obtain:—

$$E = \frac{P \left(\frac{36B}{A} + \frac{56(1 - C - D)}{C} + 56 \right)}{64 - 8P} \quad (11)$$

* Chem. and Met. Eng. (New York).

A and B are known from the coke analysis; C and D are known from the lime analysis; and P is known from the analysis of the crude carbide. Hence the efficiency of conversion can be calculated quickly by simple substitution.

The following example will show the practical application of the foregoing formula:—

Data—

Coke analysis: 0.903 fixed carbon, 0.069 ash.

Lime analysis: 0.768 CaO , 0.177 loss on ignition.

Mixture ratio: 200lb. lime to 130lb. coke.

Charged into furnace: 766lb. of above mixture.

Recovery: 459lb. crude carbide.

Analysis of product: 0.076 CaC_2 .

Calculations—

$$\frac{200 \times .768}{130 \times .903} = \frac{56}{X}, \text{ whence } X = 36.3.$$

Then the proportions in the mixture are $\frac{36.3}{A} : \frac{56}{C}$.

A = 0.903; B = 0.069; C = 0.768; D = 0.177; P = 0.760.

Then by formula II, E = 0.824, or 82.4 per cent. efficiency of conversion.

As a check on the above calculation it is often of interest to go back and calculate the weight of the furnace product, using formula I for F. The result thus obtained should show a fairly close agreement with the weight of furnace product actually obtained. The writer has checked repeatedly within 3 per cent. in this manner.

For instance, in the example given above, the weight of the charge can be computed thus:—

$$\frac{36.3}{A} + \frac{56}{C} = \frac{36.3}{0.903} + \frac{56}{0.768} = 113.1.$$

By formula I, F = 69.4.

The weight of the charge actually used was 766lb.

Hence, 113.1 : 69.4 :: 766 : X.

Whence, X = 470lb., theoretical weight of the furnace product. This result shows a variation from the weight of the crude carbide actually obtained (459lb.) of 2.3 per cent.

Sometimes it is desirable to know the maximum purity of the crude carbide that can be obtained from given raw materials, with an efficiency of conversion of 100 per cent. This can be found by putting E = 1 in the above formula for P, which then reduces to

$$P_{\max} = \frac{64 \times 1}{64 + \frac{36B}{A} + \frac{56(1 - C - D)}{C}}$$

In the example given above the maximum purity obtainable is 90.4 per cent.

Although a high degree of accuracy is not claimed for these formulae, on account of the assumptions made regarding the chemical changes in the carbide reaction, nevertheless they have proved very helpful in the work for which they were developed.

METALLURGY OF LEAD.

IN conjunction with the University of Utah and with various mining companies, the United States Bureau of Mines has since 1914 been carrying on extensive experiments for the purpose of the better utilisation of the ore treasures of the State of Utah. A detailed account of the researches on the low-grade lead ore is given in Bulletin 157 of the Bureau, by Dorsey A. Lyon and Oliver C. Ralston.

Most of the processes tried are modifications of well-known processes; but there is much scope for variety in their application, and some of the innovations, also in roasting furnaces, are of considerable interest. Some novelties in flotation are also noteworthy. Thus the lead can most profitably be recovered from leached ores by electrolysis, and chloridising roasting at higher temperatures than usually recommended, followed by electric precipitation of the metallic fumes, looks promising. The ores dealt with may be classified as carbonates and more or less oxidised ores, sulphides and slimes; gold and silver may be present, and their recovery will complicate matters. Oxidised ores are generally leached with brine to which hydrochloric or sulphuric acid is added; the chloride solution is precipitated with lime or electrolysed, and it was found that the electrolysis with iron anodes answered very well, especially in impure solutions; by currents

of less than 1 volt and of high density, 40 amperes per square foot, the current efficiency then rising above 90 per cent. The spongy lead produced oxidises rapidly, but when compressed it can easily be smelted and freed of iron dross. Silver in the electrolytic bath is subsequently precipitated by lime or better by scrap iron. If not present as chloride, the silver would not pass into solution; such ores are submitted to chloridising roasting by the old Augustin process. For that roasting both pyrite and salt should be added to the ore and coal.

In Utah the roasting was effected in new furnaces of Holt-Dern or Christensen. When the temperature is kept at about 700° C., little lead is volatilised, and this lead can be recovered by the electric dust-precipitation process of Cottrell. For mixed sulphides the temperature may purposely be raised, and the metal fumes be precipitated. In the presence of zinc sulphide, however, copper, silver, and gold are retained with the zinc, and are not volatilised; the iron is converted into oxide, and the lead volatilises. The calcium chloride from the furnace slag can be used for further chloridising roasting in the place of sodium chloride. Some carbonate ores slime badly; these slimes can be concentrated by flotation after superficial sulphidising, which is best effected by means of sodium sulphide, as the experiments show; sulphuretted hydrogen is too much of a nuisance. The silver and gold rise with the lead. Whether flotation is on the whole practicable depends upon transport and water facilities and other general features, of course. The treatment of mixed sulphides containing zinc remains a rather difficult problem.—*Engineering*.

SUPPLIES OF GERMAN POTASH.

THE Government have recently acquired from Germany a quantity of potash salts in exchange for food, and arrangements have now been made by the Board of Trade, in conjunction with the Board of Agriculture, for the distribution of about 40,000 tons for agricultural purposes. The sale of the material will be undertaken by the British Potash Company Limited, 49, Queen Victoria Street, London, E.C.4, under the direction of an official committee, on which the Board of Trade and the Departments of Agriculture for England, Scotland, and Ireland will be represented, together with representatives of trade interests.

The following maximum selling prices have been agreed:—For sales to farmers delivered to nearest railway station in Great Britain or Ireland, in lots of not less than four tons—potash salts, 30 per cent. K_2O , £12 10s.; muriate of potash, 80 per cent. KCl , £20 12s. 6d.; sulphate of potash, 90 per cent. K_2SO_4 , £23 2s. 6d., all per ton net cash in bags. Manure mixers, merchants, dealers, and co-operative societies will be allowed a discount on these prices of 7s. 6d. per ton on potash salts and 10s. per ton on the muriate and sulphate of potash. The potash will be sold at the above basis prices, and a proportionate increase or decrease will be made for higher or lower quality as shown by analysis of a representative sample of each consignment.

Farmers should place their orders without delay with their usual dealer or co-operative society. Manure mixers, merchants, dealers, and co-operative societies should send their orders to the British Potash Company, 49, Queen Victoria Street, London, E.C.4. Special terms may be arranged for purchases ex ship.

For sales of small quantities made ex merchants' store the Board would regard as reasonable the following maximum additions to the price charged for four-ton lots:—

Quantity delivered.	Additional price.
1 ton and over	10s. per ton
2 cwt. and over, but less than 1 ton ...	1s. per cwt.
1 cwt. and over, but less than 2 cwt. ...	2s. per cwt.
28lb. and over, but less than 1 cwt. ...	3s. per cwt.
14lb. and over, but less than 28lb.	4s. per cwt.

No potash of a lower grade than 30 per cent. salts is available under the above arrangement, but licences are being granted to the Alsace Lorraine Trading and Development Company, 54, Gresham Street, London, E.C.2, for the importation of 20,000 tons in all of kainit (14 per cent. K_2O) and sylvinit (20 per cent. K_2O). Farmers who wish to purchase potash of these grades should apply to their usual dealers.

LONG-TERM CREDITS FOR EXPORTS.

THE Board of Trade announce that an office will shortly be opened under management appointed by the Board for furnishing sterling credits in accordance with the scheme for assisting the exportation of goods to certain disorganised parts of Europe, which was referred to by the Prime Minister in the House of Commons last week. The credits will be based on bills drawn in this country by the seller of the goods and accepted by the buyer, and will be subject either (a) to the deposit with an approved bank in the country of purchase of currency to an amount required by the office, or (b) to a guarantee of currency of a required amount by an approved bank, or (c) to arrangements for the handing over of produce of the buying country, or (d) to the deposit of securities with the approved bank or the office under the scheme. The office will fix periodically the amount of currency required to be deposited per £100 sterling, and will have power to vary its charges according to the nature of each transaction. The credits will continue for such periods as the office may determine in each case, having regard to the economic prospects of the country concerned and the character of the business, but the maximum period will be three years. The charges for each period of six months will be on a rising scale in order to induce early liquidation.

The office will be entitled (a) to take over and liquidate collateral pledges, (b) to have recourse against the acceptor of the bill for any deficiency, and (c) to have recourse against the guarantor. The credits furnished will not as a rule exceed 80 per cent. of the prime cost of the goods sold, plus freight and insurance (including the charge made by the office). In special cases, however, at the discretion of the Executive, the amount may be increased, but in no case will it exceed the prime cost plus freight and insurance (including the charge made by the office). If the proceeds of the bill are less than the prime cost plus freight plus insurance (including the charge made by the office), the loss represented by the difference will be divided between the office and the drawer of the bill in the proportion of four-fifths to one-fifth.

Business will be taken only through banks and on the reports of banks, and the aggregate amount of credit to be granted will not exceed £26,000,000.

The area and classes of goods to which the scheme relates will be settled from time to time by the Government, but credits will not be furnished either for the export of raw material or for the sale of stocks held by Government Departments.

A SUGGESTED EMPIRE PATENT LAW.

A COMMITTEE of the Institute of Electrical Engineers, which has been considering the subject of a British Empire patent law, has drawn up a scheme, by which any person would be able to obtain an Empire patent covering as many of the British Dominions, Colonies, Dependencies, and Protectorates (collectively referred to, for convenience, as territories) as he may select, by making application to the British Patent Office. The fees payable would be the sum of the existing local Government fees in the selected territories, plus such small fee as might be charged by the British Patent Office to cover the expense of carrying out its part of the scheme. The application would be examined and the patent granted in the same way as in an application for a British patent, and the specification, when printed, would bear the names of the selected territories in which it would be effective. Thereafter the patent would be assimilated with the domestic patents in each of the selected territories, and would be subject to the local laws in such territories for the determination of validity, infringement, and all other questions affecting Letters Patent after grant. Careful consideration has been given to the suggestion that a patent should be obtainable covering the whole of the British Empire in the same way that a patent in the United States covers all the States in the Union, but there are so many difficulties connected with such a scheme that it is not felt any practical result could be expected of any attempt to elaborate a proposal along such lines. It is believed that the suggested scheme is practical, and has the merit that it could easily and immediately be put into operation without disturbing the existing laws in the various territories in the Empire.

ITEMS OF INTEREST.

SALES OF SURPLUS GOVERNMENT PROPERTY.—The sum realised by sales of surplus Government property, as shown by the latest official figures, is now £162,509,246. This includes £100,633,988. for sale on trading account; £46,563,905. for other surplus stores at home; and £15,311,353. abroad.

NEW COLOUR WORKS AT SELBY.—Some ten acres of land have been purchased in The Holmes, at Selby (Yorks.), by Messrs. Thevenaz and Company, of Hull, for the purpose of erecting dye and colour works thereon. The new industry will give employment to a large number of workpeople.

SCIENCE AND KEY INDUSTRIES EXHIBITION AT GLASGOW.—Good progress is being made with the arrangements for the British Science and Key Industries Exhibition, which the Glasgow Corporation are to hold within the Kelvin Hall of Industries, Kelvingrove, Glasgow, from November 17 to 29 next.

WINDING-UP THE GREYNA FACTORY.—Official intimation has been received at Greytna Munition Factory near Carlisle, that the manufacture of explosives is to cease. The 3,000 workers now at Greytna are to be reduced still further, and only sufficient retained to keep the machinery in order. The services of officials will also be dispensed with.

FIRE.—While a number of workmen were engaged at the Columbia Works of Messrs. Joseph Thompson and Co., of Sheffield, emery and bone cutters, on Friday (August 22), a spark set fire to xylonite dust, and the front of the large three-storey building was quickly a mass of flames. All employees escaped with the exception of Benjamin Wildsmith.

GERMAN GLYCERINE STOCKS.—The Koln-Rottweiler Company in Berlin are to take over conjointly with the United Chemical Works, Charlottenburg, from the Imperial Realisation Office the disposal of the stocks of glycerine, and it is reported that these two companies, along with the Dynamite Trust, are to form a limited liability company to undertake this task.

SCOTTISH SHALE OIL WORKERS.—A ballot by the members of the Federation of Scottish Shale Oil Workers on the question of a shorter working day has resulted in an overwhelming majority in favour of stoppage of work, but the joint board of the Federation on Tuesday decided to withhold notices in view of the invitation to meet the representatives of the companies in conference in London early next month.

BRITISH SCIENCE GUILD.—The ninth number of the *Journal* of the British Science Guild may be obtained—price 6d. per copy, postage, 1½d.—on application to the Secretary, British Science Guild, 199, Piccadilly, W.1. The *Journal* contains the report of the work of the Guild for 1918-19, various memoranda, and a report of the annual meeting, with addresses by Major-General Seely, Sir Joseph Thomson, and Lord Sydenham, on "Science and Labour Unrest."

NORFOLK OILFIELDS.—It is stated that the first commercial retort for the distillation of the Norfolk oil shales owned by English Oilfields, Limited, has been tested, and that the results have been satisfactory beyond expectation. A new type of retort is being used for the treatment of the shale, and the crude oil obtained is described as of good quality. Arrangements are now in train for the erection of the entire retorting plant. A model village for the employees is being planned.

NON-FERROUS METALS RESEARCH.—The British Non-Ferrous Metals Research Association is in process of formation under the Government scheme for industrial research, and it is expected that the Board of Trade will issue a licence to the Association in the near future. The Association will encourage and develop technical efficiency in the production, treatment, and utilisation of non-ferrous metals and alloys, by the promotion and application of scientific and industrial research, and also institute an information bureau of all important technical and scientific information directly or indirectly relative to the non-ferrous metals industries of the British Empire. It is hoped that the information collected during the war and in the possession of the Ministry of Munitions will be made available for the use of the Association. Any further information and particulars will be gladly supplied on application to the secretary, Provisional Committee, British Non-Ferrous Metals Research Association, 30, Paradise Street, Birmingham.

ZINC AND ZINC DUST PRICES.—There is no change to report in the price of Australian high grade zinc dust (88% 92% metallic zinc), which remains at £70. per ton f.o.r. The Zinc Producers' Association continue to allow their customers the benefit of any reduction made in their selling price of zinc dust within 30 days of acceptance of order. The price of Australian electrolytic zinc, containing 99.95% metallic zinc, is unchanged at £42. per ton f.o.b. Australia for direct shipment to New Zealand, India, South Africa and the Far East.

GLASGOW TECHNICAL COLLEGE APPOINTMENTS.—Important appointments to the Chemistry Department of Glasgow Technical College were made at a special meeting of the governors on Tuesday. It was resolved to recommend that Dr. Thomas Gray, the Professor of Technical Chemistry, be appointed Director of the School of Chemistry, and that the vacancy due to Dr. G. G. Henderson's resignation be filled by the appointment of assistants in the department of chemistry—Mr. Forsyth J. Wilson, D.Sc., Ph.D., F.I.C. (late Captain and chemical advisor to the 11th Army Corps), and Mr. Isidor M. Heilbron, D.S.O., D.Sc. Ph.D., F.I.C. (late Lieutenant-Colonel and a senior staff officer in the Salonica Forces)—the former with the title of Professor of Inorganic and Analytical Chemistry, and the latter with the title of Professor of Organic Chemistry.

FRENCH FIRMS RESUMING BUSINESS.—The following declarations of partial or complete resumption of business by French individuals and commercial concerns, in accordance with article 55 of the law of April 17, 1919, on the reparation of damages caused by the war, have been published in the *Journal Officiel*:—Léon et Charles Goubé, oil dealers, Lille, resuming work gradually; Société Anonyme des Produits Refractaires, refractories, Feignes, partial resumption; Asin-Loche, dealers in fertilisers and wool wastes, Villers-Pol, par Le Quesnoy, partial resumption; Société Anonyme des Ciments Portland Français, Portland cement manufacturers, Bettrechies-les-Bavay, partial resumption; Louis Rey, dealers in drugs, chemical products, Cambrai, partial resumption; J. H. Leclercq Fils, oil manufacturers, Marcq-en-Baroeul, partial resumption.

IMPORTATION OF FUEL OILS.—The Board of Trade understand that the notice issued by them on August 22 with reference to the interim administration of the Government's key industry policy has led to some misapprehension. Pending legislation a general licence under the prohibition of imports proclamations is to be issued to cover all goods, with the exception of those set out in the list of key industries. In the case of kerosene and benzine (including white spirit), gas oil, and fuel oil, this general licence refers to total quantity of import, and does not affect the agreement entered into by the Government to limit the number of importing firms for the period of the existence of the Pool Board and nine months thereafter to those firms which co-operated with the Government to form the Pool Board, as a result of which the community received material benefits. The termination of the war organisation of the Pool Board as from January 31, 1919, was announced in the Press on January 2. The nine months' period which has to elapse before other firms are allowed to import does not therefore expire until October 31.

UNITED STATES EXPORTS OF DYESTUFFS.—The total dyes and dyestuffs exported from the United States during May showed a decrease as compared with the exports during May of last year, the value being 954,943dols. as compared with 1,278,578dols., according to figures issued by the Bureau of Foreign and Domestic Commerce. During the eleven-month period ending with May exports had a value of 16,473,019dols. as compared with 15,244,771dols. exported during May last year, and 10,249,241dols. exported during the same period the year before. Aniline dyes exported during May were valued at 585,970dols. as compared with exports of 626,204dols. during May last year. During the eleven-month period ending with May exports were valued at 9,325,287dols. as compared with 6,469,497dols. during the same period last year. Total chemicals, drugs, dyes, and medicines exported during May were valued at 9,732,617dols. as compared with 13,086,270dols. During the eleven-month period ending with May, exports were valued at 135,785,933dols. as compared with 165,365,629dols. exported during the same period last year, and 168,786,802dols. during the same period the year before.

ASBESTOS WORKERS' PAY.—The management of the Cape Asbestos Company, at Barking, on August 22, received the officials of the National Union of General Workers concerning the dispute which has occurred there with reference to a recent arbitration award to the female workers, some 400 of whom were on strike last week. The management have agreed to concede the award of an increase of 5s. to female workers over 18, and 2s. 6d. to those under 18 as from June 1 last. They also agreed to the demand for a forty-eight hours' week without reduction of pay. The claim for a week's holiday was left over to see if it is adopted in the asbestos industry generally, in which case the Barking company have practically promised to fall into line. The employees resumed work on Monday.

IMPORTATION OF BONES AND BONE MEAL INTO SOUTHERN RHODESIA.—A Notification No. 225, dated June 27, issued under the "Animals Diseases Consolidation Ordinance, 1904," of Southern Rhodesia, provides that the following regulations shall be in force from June 27—viz., No person shall import any bones (for use), or any material wholly or partially manufactured or derived from bone, such as bone meal, bone flour, bone dust, dissolved bones, bone compound, or the like, unless such bones shall have been sterilised by subjection to either: (a) A dry heat of 140° C. for not less than three hours; or (b) a moist heat (under pressure) of 105° C. for not less than fifteen minutes. A declaration to this effect shall be furnished by the importer with the application for registration under Section 1 of Government Notice No. 421 of 1914, and, further, in any sale effected the seller shall furnish to the buyer the said declaration, in addition to the invoice required by Sections 6 and 7 of the said notice. Any person contravening these regulations shall be liable to the penalty provided under the Ordinance. If at any time it shall subsequently appear that any person has made such declaration falsely, he shall be liable to the penalty provided under the Ordinance.

JOINTS OF GLASS TO METAL.—Some tests recently completed at the U.S. Bureau of Standards on the strength of metal joints used in the gas manipulation and purification work have shown that platinised glass tubes fused into metal tubes will hold pressure up to about 3,000lbs per square inch. Capillary tubes, fastened to metal in the same way, will hold in excess of 6,000 pounds per square inch. Some of the applications of this in connection with laboratory work will be discussed in a paper which is now in preparation. Some of these are: 1. In connection with glass bulbs and small valves used in handling and accurately weighing liquefied gases under pressure, such as ammonia, carbon dioxide and ethyl chloride; 2. In the accurate determination of gas densities under normal conditions by condensing the gas by means of liquid air into glass bulbs provided with metal inlet and outlet, which can be subsequently weighed more accurately than the large bulb in which the volume and pressure of the gas are measured; 3. In the determination of the density of volatile liquids and liquefied gases to a high degree of accuracy; 4. As a vacuum tight and clean joint between metal containers used in the purification of gases at high pressures, and glass apparatus used in their purification in vacuo.

NITROGEN PRODUCTS COMMITTEE'S REPORT.—The Report of the Nitrogen Products Committee, appointed in June, 1916 which was ready last May, is still unpublished. The terms of reference were wide, and doubtless the Report is a voluminous document; but, even so, the suggestion that the delay in its publication is due to the time required for the preparation of an index seems unconvincing. We suspect, says *The Times*, that the Government had their usual hesitancy in deciding on a policy. The Committee carried out much experimental work on the production of ammonia by the direct union of hydrogen and nitrogen on the Haber method. The general principles of this method are well known, but the all-important technical details were a German secret. The Committee are believed to have attained results which are in some respects better than the German practice. We understand that the Report recommends the establishment of a plant on a commercial scale, as the experimental apparatus at University College, where the investigations were conducted, was only on a laboratory scale. So far, concludes our contemporary, Great Britain has done little except to produce reports. Early last year the Government began the erection of an ammonia factory at Billingham-on-Tees, but this was not given precedence over schemes like the motor works at Slough, and is still a long way from completion.

PATENTS IN 1918.

THE thirty-sixth report of the Comptroller General of Patents, Designs, and Trade Marks, issued as a White Paper, shows that last year 168 applications were made under the Patents, Designs, and Trade Marks Temporary Acts and Rules, for the avoidance or suspension of patent rights. In 146 of these licences have been, or will be, granted, and in six other cases the patents have been suspended in favour of the applicants. Of the remaining applications one has been refused, five have been withdrawn or abandoned, four have been returned as not being required by reason of the patents having expired, or for some other cause, and the rest have not yet been decided. Four applications for the avoidance or suspension of the registration of trade marks were received. One application was refused, one application was withdrawn, and the remaining two cases were allowed to stand over.

During 1918, 31 applications for the grant of licences under patents vested in the Custodian under Section 6 of the Trading with the Enemy (Amendment) Act 1916, were received. Two of these applications were withdrawn, and in the remaining 29 cases licences have been or will be granted. During the year it was decided that the benefit of all enemy owned patents should be vested in the Custodian, and under the Trading with the Enemy (Amendment) Act 1918, an order was made on October 31, 1918. From the date of the vesting order to the end of the year five applications for the grant of licences under such patents were received. One of these was returned as the patent had expired, and in the remaining four cases licences will be granted.

The applications for patents and trade-marks during 1918 show an advance on those for 1917, but the applications for designs are lower in number. In the years from 1908 to 1914 the greatest number of applications for patents was 30,603 in 1909; 42,077 designs were registered in 1912; and 6,112 trade-marks were registered in 1909. Last year's figures were as under:—

Patents. Applications, 21,839; specifications: provisional, 15,662; complete, 13,263; sealed, 10,809.

Designs.—Applications, 10,019; registered, 9,597.

Trade-Marks.—Applications, 6,968; registered, 3,055.

The receipts from patents fees were £314,431., and from designs fees £5,767., being increases of £22,216. and £355. over the respective amounts for 1917. The total receipts were £345,405., as compared with £318,149. in 1917, an increase of £27,256. The surplus of receipts over expenditure was £135,890., as compared with £124,427. in 1917.

In the Patents Department there was again a large increase in renewal fees, which amounted to £232,629. against £219,693. in 1917.

The number of applications made for the restoration of patents which had lapsed was 23, of which nine are still pending. The number of applications to register designs was 10,019, as compared with 13,208 in 1917. During the year 3,451 trade-marks were advertised and 3,055 were registered.

CUMBERLAND COKING AND BY-PRODUCT INDUSTRIES.

(SPECIALLY CONTRIBUTED.)

The dullness in the Cumberland and North Lancashire hematite pig-iron market precludes any immediate hope that additional furnaces may be put into blast on ordinary iron, and so bring about such a demand for local coke as would compel the working of the 380 by-product ovens at their full capacity. The very quietude of the iron market, however, may result in smelters at their meeting next week lowering prices, and in that case, of course, the outlook might conceivably be very much improved. The general feeling is that only a substantial revival of the rail trade can justify an increase of the production of ordinary iron, and therefore, an expansion of the output of local coke. Some of the ovens have had difficulty this week in getting all their coal requirements satisfied, production at the collieries, one of which is still idle on account of labour difficulties, having been below the average. East Coast coke supplies to West Cumberland this week are under 9,000 tons and to the Furness district, 15,100 tons. The make of by-products is somewhat diminished. Benzole is being marketed with ease both here and in Ireland, and the full output of sulphate of ammonia is being absorbed. Spain is taking a good proportion of pitch. Creosote is in fair demand.

OBITUARY.

PROFESSOR VERNON HARCOURT.

The death of Professor Augustus John Vernon Harcourt, M.A., F.R.S., which took place in the Isle of Wight on Saturday last at the age of 84 years, is announced by *The Times*.

Educated at Cheam, Harrow, and Balliol, it was at Balliol under Henry Smith that Professor Harcourt laid the foundation of his chemical career. When Brodie, also a Harrow and Balliol man, later a pupil of Bunsen, returned to Oxford as Professor of Chemistry, Harcourt became first his pupil and then his assistant. At Balliol Brodie began working on the peroxides of the acid radicals, and afterwards on the oxidation of graphite, and then turned to the systematic study of alkaline peroxides, whose reducing action he was the first to explain—incidentally supplying a strong chemical argument in favour of the diatomic nature of oxygen. In 1858 Brodie migrated to the chemical department of the new museum, and took Harcourt still an undergraduate—with him as lecture assistant. A year later Harcourt was appointed Demonstrator in the students' laboratory. In the summer of 1858 Harcourt gained a first class in the School of Natural Science, and in 1859 was elected a student of Christ Church and Lee's Reader in Chemistry. For six years he continued to work under Brodie at the University Museum, and then moved into the Lee's Laboratory at Christ Church, vacated by Dr. George Rolleston on his election to the Linacre Professorship of Comparative Anatomy. At Christ Church Harcourt continued the investigations which he had begun in the museum on the Rate of Chemical Change.

The influence of his master, Brodie, can be plainly traced in Harcourt's chemical career. Brodie's work on the alkaline peroxides led Harcourt in the first place to investigate the conditions under which oxygen was absorbed by the metals potassium and sodium, and secondly to investigate the course of a chemical change in cases where the reactions occur slowly enough to be followed throughout their progressive stages. In his first paper Harcourt established the formulæ of potassium and sodium peroxides by experiments as simple and well-designed as they are conclusive; and then began to study the course of such oxidations as those effected by permanganic acid and hydrogen peroxide with the object of determining the law connecting the rate of a given chemical action with the quantities of the reacting substances.

The bold generalisation of Berthollet—that chemical change was not an action independent of mechanical laws, but that the amount of change was governed by the "mass" of the reacting substances as well as by chemical affinity—remained for his own and for two succeeding generations of chemists a brilliant but unworkable idea. It was not at once, but only after long search, that Harcourt found a reaction simple enough to be followed throughout without complications caused by secondary actions due to the products of the primary change. But at length he hit on the action between hydrogen peroxide and hydrogen iodide, which proceeded with the necessary simplicity and at a convenient rate for study. Harcourt and his collaborator, Esson, showed that when the conditions of the experiment were kept constant the rate of the chemical change was strictly proportional to the mass of the reacting substances; and with the same apparatus they were able to show the effect of temperature on the rate of the chemical change, and so accurately could the changes be followed that they were able to calculate the absolute zero of chemical action—a datum in surprising agreement with the absolute zero of temperature obtained by physical methods.

Though one of the pioneers of physical chemistry, Harcourt remained a sceptic towards the new theories of solution and ionization, and the word "dissociation" was anathema to him. In his last address as president of the Chemical Society, in 1897, he maintained that the distinction between dissociation and decomposition was absurd. In applied chemistry Harcourt was chiefly drawn to questions dealing with the purification and testing of coal gas, he having been appointed (in 1872) one of three Metropolitan Gas Referees whose duty it is to prescribe the mode of testing the London gas and—subject to the various Acts of Parliament—to fix the limits of impurity allowed. One of his early researches on coal gas was his attempt to purify the gas from sulphur compounds by means which he devised for converting the carbon disulphide into hydrogen sulphide. Harcourt's "sulphur test" came into wide use, but its application on a large scale for the purification of coal gas has only recently been carried out successfully by Dr. Charles Carpenter at the South Metropolitan Gas Works.

FERTILISER NEWS.

(SPECIALLY CONTRIBUTED.)

Sulphate of Ammonia.—The demand for this material is quite good at the present time, and, according to late reports, the price is now said to be in the region of £20. Certainly, higher prices are looked for. The amount of sulphate being produced is not great, and already the export trade appears to have been cut down so as not to limit unduly the supplies available for home requirements. From the United States advices are to the effect that sulphate of ammonia trading in that market has developed to no unusual proportions; and nothing beyond a moderate demand is noted for both domestic consumption and for export purposes. Since last writing, prices have fractionally declined in New York; but even this condition has had no effect in the way of stimulating business, with buyers seemingly not interested in forward stocks for the time being.

Basic Slag.—This is perhaps the busiest spot in the fertiliser market at the moment. Demand is exceedingly good, and buyers appear to be often requiring very large quantities in proportion to the acreage of their farms. Doubts are expressed, however, as to whether the supply will last over the winter. It is increasingly clear that more than ever orders should be placed early, as only the extreme optimists believe that accidental factors will leave stock available for later buying.

Superphosphates.—Superphosphates appear to be in improved demand, and prices are understood to be going higher. The phosphate rock position in America is still somewhat complicated, and the market is said as a result to be a very nominal affair. Florida producers are making no headway. The Tennessee output is sold up for several months ahead. American advices agree that foreign markets will undoubtedly be open for large quantities of American phosphate rock, but labour difficulties there are still a serious handicap to the producers, with no encouragement offered for any immediate adjustment of affairs.

Potash.—The reported acquisition of 40,000 tons of German potash salts for sale in this country, to be paid for by food exports, is very interesting to the British farmer, much of whose land has been half starved for potash for an unduly prolonged period. Prices are said to have been fixed as follows for sales to farmers at nearest railway-stations in lots of 4 tons and upwards: £12. 10s. per ton for potash salts 30 per cent. K_2O ; £20. 12s. 6d. for 80 per cent. muriate; and £23. 2s. 6d. for 90 per cent. sulphate. The demand at these rates is expected to be brisk. Smaller quantities than 4-ton lots will be traded in at slightly advanced figures. The present arrangement does not deal with any potash of a lower grade than 30 per cent. salts. It is reported later, however, that some 20,000 tons are coming, composed of 14 per cent. kainit and 20 per cent. sylvinit.

Bone Meals.—The situation in East Indian bone meal in particular is a very tight one at the present time. Supplies show no appreciable increase, and prospects for imports are not good in the present shipping position. News continues to come to hand about the large supplies of bone meal that are available in India and awaiting export to this country, but there is no indication of shiproom being allocated for their transport. The price is still a good one here, and East Indian producers would no doubt like to be able to take advantage of it. It seems a pity that the producing and consuming ends, therefore, cannot get together.

Norway Chemical Works' Troubles.—Latest advices from Norway indicate that the chemical position there has not been good for some time. There are various reasons for the stoppage of factories, such as absence of orders and strikes amongst the workmen. The Norwegian Nitrate Company have just restarted some furnaces after three months of strike, which has been settled by granting the eight-hour day. The company, it appears, like other electro-chemical concerns, have to contemplate fresh difficulties in respect to wages, which, if not agreed upon, may imperil further production by this class of factory in Norway.

Italian Fertiliser Prices.—The agricultural position in Italy does not appear to move very satisfactorily, but certain fertilisers are on offer at appreciable prices. We find, for example, that superphosphate, 14-16 per cent., can be had at 1.37 lire, and bone superphosphate at 3 to 3.40 lire, per unit. Basic slag, 12-14 per cent. phosphoric anhydride total, is offered at 30 lire, and nitrate of soda at 94 lire. Sulphate of ammonia, 20-21 per cent., is valued at 135 lire per cwt. Chili nitrate of soda is quoted in the South at 100-110 lire per cwt.

PARLIAMENTARY NEWS.

Fuel Research.

In the House of Commons Lieut.-Colonel Burgoyne asked the Chancellor of the Exchequer whether, in view of the shortage of domestic and industrial fuel, the great demand for oil, and the publicity which is being given to the possibility of producing these substances from low-grade coal, colliery waste, and/or other bituminous material, he will consider the advisability of taking steps to protect the public from investing in schemes which are technically unsound?

Mr. H. Fisher: My right hon. Friend has asked me to answer this question. The Government are doing everything they can by setting up a Fuel Research Station for the purpose of providing the public with schemes which are technically sound to guard them against investing their money in schemes which are not technically sound.

Lieut.-Colonel Burgoyne asked the Prime Minister what progress has been made to date in connection with the Government experimental Fuel Research Station at Greenwich; what amount of money has been expended in connection therewith; and whether any results have been obtained towards the utilisation of inferior coal and colliery waste which will tend to increase the amount of domestic and industrial fuel, solid and liquid, for public distribution and consumption during the coming winter months?

Mr. H. Fisher: The Prime Minister has asked me to answer this question. The laboratories at the Fuel Research Station are completed and have begun work. The main building will, it is hoped, be completed next month. The recorded expenditure up to the present on buildings and equipment is £130,924, and it is estimated that the cost under these heads will be £193,588 when the station as at present planned is finished. It has not yet been possible to conduct experiments bearing on the last part of the question, but they will be undertaken in due course after the station is complete.

Shipment of Oilseed Cargoes.

Lieut.-Commander Kenworthy asked the President of the Board of Trade if he is aware that, according to the estimate of the secretary of the Oilseed Supply Committee, 42,657 tons of copra, oilseed, and kernels have been conveyed to Hull by railway wagons since the Armistice; why arrangements cannot be made to ship the Australasian portion of these cargoes direct to Hull in the monthly Commonwealth steamer to that port; and, if not, whether, in view of wagon shortage, other means of direct shipment can be arranged?

Mr. Bridgeman: I am making inquiries into this matter, and will consider what action can be taken to improve the present arrangements for dealing with these cargoes.

LEGAL INTELLIGENCE.

Extracting Oil from Shale.

At the London Bankruptcy Court on Tuesday last before Mr. Registrar Francke, the public examination was held of Robert Ferguson Strong, 69, Ranelagh Road, Pimlico, lately carrying on business and residing at 109, Victoria Street, S.W.1., civil and mining engineer. The statement of affairs filed by the debtor disclosed gross liabilities amounting to £554. 5s. 1d. (of which £521. 9s. 4d. was expected to rank against the estate for dividend), assets nil, thus showing a deficiency of £521. 9s. 4d.

The Receiving Order was made on a creditor's petition on June 19, 1919, the act of bankruptcy being failure of the debtor to comply with the requirements of a bankruptcy notice.

Replying to questions put by the Official Receiver, debtor stated that for the past fifty years he had followed the occupation of a civil and mining engineer, and that for the past twenty or thirty years his earnings had not exceeded £130. per annum; about ten years ago he commenced to experiment for the production of oil from coal, peat, shale and other substances, in which he was successful, but subsequent efforts to form a company to acquire his inventions proved to be abortive, and the letters patent which he held lapsed, and at the date of the receiving order he was negotiating with a firm of financiers for the erection of a small plant at Portland for the purpose of demonstrating that oil can be produced from the shale there. He attributed his failure and insolvency mainly to lack of capital and delay, owing to the war, in obtaining the necessary funds for the erection of

plant to work the fuel oil industry. He has kept no books of account.

The examination was concluded.

A Marking-ink Manufacturer's Failure.

At the London Bankruptcy Court on Tuesday last before Mr. Registrar Francke, the public examination was held of Robert Sturley, described as lately carrying on business as R. Sturley and Sons, at 18 and 19, Bridge Road, Stratford, manufacturers and agents. The Receiving Order was made on a creditor's petition. The statement of affairs filed by the debtor disclosed gross liabilities amounting to £508. 7s., and assets, £190. 6s., thus showing a deficiency of £318. 1s.

Replying to questions put by the Official Receiver, debtor stated that for 14 years prior to 1915 he carried on business as a marking ink manufacturer at 95, Morville Street, and 18 and 19, Bridge Road, but that owing to difficulties since the war in obtaining materials, he discontinued the business. He then began business at 18 and 19, Bridge Road as a manufacturers' agent. Down to about six months ago he was just able to make a living but he had always been handicapped by continued ill-health and lack of capital. In February last owing to pressure of creditors and having no stock he was compelled to cease trading and he is now employed as a traveller at a salary of £3. a week and expenses. He attributed his failure and insolvency to the stoppage of his marking ink business owing to the war and to the expenses of the continued illness of himself and family. Debtor had not kept any books of account and had never been bankrupt before.

The examination was concluded.

GAZETTE NEWS.

LIMITED COMPANIES.—Appointments of Receivers; Resolutions and Notices as to Winding-up; Petitions, Orders, and Official and Other Notices.

British Coalite Company, Ltd.—Resolved July 22, confirmed August 6: That the scheme submitted to this meeting for the amalgamation of the company with Coalite, Ltd., and Low Temperature Carbonisation, Ltd., be approved, and that for the purpose of carrying the same into effect the company be wound up. H. Bacon and another, liquidators.

Broughton Rubber Company, Ltd., Manchester.—H. W. Garnett, 61, Brown Street, Manchester, chartered accountant, appointed receiver August 6.

Coalite, Ltd.—Resolved July 22, confirmed August 6: That the scheme submitted to this meeting for the amalgamation of the company with British Coalite Company, Ltd., and Low Temperature Carbonisation, Ltd., be approved, and that for the purpose of carrying the same into effect the company be wound up. H. Bacon and another, liquidators.

Grays Chemical Works, Ltd.—Petition presented, August 8, by Dr. G. T. Morgan, 13, Elms Avenue, Muswellhill, N. Hearing, Royal Courts of Justice, Strand, October 14. Tippetts, 11, Maiden Lane, Queen Street, E.C., and 189, Earl's Court Road, S.W., solicitors.

Hay's Waterproof Glue and New Patent Enamel Composition and Varnish Company, Ltd., Portsmouth. Resolved July 14, confirmed August 1: That the company be wound up. F. O. Goodman, 24a, Commercial Road, Portsmouth, liquidator, who is authorised to sell and dispose of the company's undertaking on terms not less beneficial to the company than those contained in an agreement submitted to the meeting and expressed to be made on behalf of the company of the one part and Jno. H. Franckeiss of the other part.

London and Maikop Oil Corporation, Ltd., London, E.C.—Resolved July 30, confirmed August 14: That the company be wound up. A. E. Cave, Sun Court, Cornhill, E.C., F.C.A., liquidator. Meeting of creditors offices of company, 20, Copthall Avenue, E.C., September 2, at 12 noon.

Minbu Oil Company of Burma, Ltd., London, E.C.—Resolved July 30: That it is advisable to wind up. R. M. Edington, 175, West George Street, Glasgow, accountant, liquidator.

New Selphosa Salt Company, Ltd.—Resolved July 16, confirmed August 6: That the company be wound up. T. F. Wild, liquidator.

Vulcan Globe Match Company, Ltd.—Resolved July 3, confirmed August 1: That the company be wound up. C. F. Cape, 12, Coleman Street, E.C., liquidator.

Vulcan Match Agency, Ltd.—Resolved July 3, confirmed August 1: That the company be wound up. C. F. Cape, 12, Coleman Street, E.C., liquidator.

THE PATENT LIST.

APPLICATIONS FOR BRITISH LETTERS PATENT.

The specifications of the following applications are not printed by the Patent Office until the complete specifications have been accepted.

August 18th to 23rd (inclusive).

- Utilising Explosives. Adams, S. H. 20,431.
Oxidising Anthracene. Barrett Company, 20,707.
Separation of Solids of Different Specific Gravity or Inertia. Bennett, W. 20,347.
Acetic Acid. British Cellulose and Chemical Manufacturing Company; Hotz, J.; and Soller, M. 20,574.
Refractory Material. British Thomson-Houston Company (General Electric Company). 20,386.
Separating Hydrocarbons and Water. Brown, W. A.; and White, F. G. 20,689.
Recovering Tin. Collins, J. J. 20,481.
Flotation and Collection of Minerals, etc. Conder, C. M.; and Vivian, G. T. 20,231.
Packing, Storage, and Use of Dyes. Crompton, W. E.; and Ecroyd, E. B. 20,517.
Distillation of Coal, etc. Davidson, T. M.; and Low Temperature Carbonisation, Ltd. 20,598.
Revivifying Spent Oxide. Dibdin, L. A. 20,322.
Separation and Utilisation of Sulphur from Coal Gas, etc. Finlayson, T. C.; and Morgan, J. S. 20,533.
Drying China-clay, etc. Grace, C. J. 20,763.
Tarless Fuel, etc. Harger, J. 20,259.
Recovery of Nitrating Acid in Manufacture of Nitro-cellulose, etc. Marks, E. C. R. (Hamburger). 20,670.
Production of Caustic Soda from Brine by Electrolysis. Nair, J. K. 20,784.
Protecting Ferrous Metals from Rust. Newman, T. F. 20,656.
Soap. Rogers, F. H. 20,570.
Conversion of Waste Products of Coal, etc., into Inflammable Gas. Scott, G. B. 20,651.
Casein Cements. Serle, P. H. W. 20,665.
Ore-concentrating Apparatus. Skudder, W. H. R. 20,778.
Manufacture of Ethylacetate from Paraldehyde. Soc. des Acieries et Forges de Firminy. 20,572.
Agglomeration of Finely Divided Materials. Sutcliffe, E. R. 20,503.
Aluminium, Sodium Silicates, etc. Welford, R. 20,647.

COMPLETE SPECIFICATIONS ACCEPTED.

Readers desiring to peruse any of the following specifications in the original can obtain a copy by sending 6d. in stamps to the Comptroller, Patent Office Sales Branch, 25, Southampton Buildings, Chancery Lane, W.C.

1917.
Destructive Distillation of Wood, Woody Fibre, Peat and Similar Carbonaceous Substances. Poore, P. 13,321. 131,006
1918.
Ammonium Nitrate. Bailey, C. W.; Denny, H. S.; and Jefferis, A. T. 4,877. 131,017
Chlorosulphonic Acid. Clayton Aniline Co.; Shedler, A.; and Marchant, E. N. 5,199. 131,024
Nitric Acid. Quinan, K. B. 5,397. 131,029
Anhydrous Chlorides. Heap, W.; and Newbery, E. 5,596. 131,039
Rendering Aluminium and Its Alloys More Durable. Coles, S. O. Cowper. 5,710. 131,047
Synthetic Ammonia. Maxted, E. B. 5,741. 131,049
Varnishes or Dopes. Sutherland, D. M.; and Wall Paper Manufacturers, Ltd. 6,909. 131,082
Acetaldehyde. Crossfield and Sons, J.; and Hilditch, T. P. 6,980. 131,084
Dehydration of Tar. Klein, C. A. 7,032. 131,087
Esters. Boake, Roberts, and Co., A.; Durrants, T. H.; and Ellis, W. E. 7,040. 131,088
Liberation of Hydrogen from Mixtures Containing It. L'Air Liquide Soc. Anon. pour l'Etude et l'Exploitation des Procédés Georges Claude. 7,082. 131,091
Kilns for the Incineration of Earth Matters and Dolomites, Limes, and Cements. Hodson, T. 7,623. 131,095
Distillation, Gasification, and the Like of Carbonaceous Materials, and Separation of the Volatile Matter Therefrom. Davies, W. E. 10,895. 131,105
Phenol Formaldehyde Condensation Products, and the Manufacture Thereof. Potter, H. V.; and Damard Lacquer Co. 11,601. 131,112
Removing Tar from Gas. Heise, O. A. L. 13,017. 131,125
Concentration of Ores. Scott, W. A. 13,210. 119,224
Quantitative Estimation of Vapour Pressure in Gases. Davis, H. S.; and Davis, M. D. 13,323. 131,154
Vanillin. Confectionery Ingredients, Ltd.; Matthews, F. E.; King, A. T.; and Kane, T. 13,504. 131,161
Cement. Moncrieff, Sir G. K. Scott; and Hines, J. 13,567. 131,164
Drying, Carbonising, Roasting, or Like Treatment of Materials. Erith's Engineering Co.; and Erith, C. 14,057. 131,179

ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

Organic Acid Chlorides. T. H. Durrans, Oxford; and A. Boake, Roberts and Co., Stratford, London. British Patent, 128,270, of 1917.

Organic acid chlorides of the general formula $R.CO.Cl$, where R is an aliphatic or aromatic radical, are prepared by the reaction of sulphur and chlorine on dry alkali or alkaline-earth salts of the acids in about the proportions $2 R.CO : S : 4Cl$, or $3 R.CO : S : 6 Cl$, or proportions inter-

mediate between these. The acid chloride may be distilled off, or extracted by a solvent. Acetyl chloride, benzoyl chloride, and butyryl chloride are specified as products. Specifications 25433/08 and 611/11 are referred to.

Distilling Oils. F. Tinker, Erdington, Birmingham. British Patent, 128,288, of 1917.

In the production of fuel oils from crude oils, the crude oil is mixed in a chamber *a* with hot vapour derived from the distillation in a still *b* of a portion of the treated oil with-

drawn from the chamber *a*. The crude oil enters the top of the tower or chamber *a*, and there mixes with vapours from the still *b*. The petrol and other light hydrocarbons escape in the form of vapours through a pipe *d*. The oil thus "topped" constitutes the improved fuel. The larger portion is withdrawn by a pipe *c*, a small portion flowing to the still *b*. A portion of the heavier constituents of the crude oil remains as residue in the still *b*, and is continuously withdrawn therefrom. The partial elimination of the heavier constituents in this manner decreases the viscosity of the fuel oil.

Sulphuric Acid and Sodium Sulphate. H. M. Dawson, Headingley, Leeds. British Patent, 127,677, of 1917.

Sulphuric acid is obtained from nitre-cake and other acid sodium sulphates by dissolving to produce solutions, the concentration of which is predetermined exactly by the composition of the acid sulphate and the degree of cooling chosen, and then cooling to the selected temperature (below about $0^{\circ}C.$), whereby crystals of sodium sulphate and a solution having the maximum ratio of sulphuric acid to sodium sulphate are obtained. In a modification, water is added during the cooling. Curves are given showing the amount of sodium sulphate that is held in solution in acids of various concentrations at different temperatures, and directions are given for the use of these curves for carrying out the process.

Fat Extraction. W. T. and B. B. Powling, Prittlewell, Essex. British Patent, 128,397, of 1918

Bones or other material are heated in a container of which the only outlet during the extraction process is near the bottom, the vapours and gases generated being drawn downwards through the mass by suction, and the heating and suction continued until all available grease is melted out. The illustration shows a container *H* with steam-heating jacket *H'* connected to a condenser *K* and vacuum pump *L* through a jacketed chamber *J* in which the fat is separated and collected.

In another form of apparatus, the fat collects at the bottom of the heater. After extraction of the fat, the heating may be continued to dry the treated material for use as manure or cattle or poultry food.

Varnishes. S. E. Groves, Felling-on-Tyne; and T. W. H. Ward, London. British Patent, 128,659, of 1917.

A varnish for the planes of aircraft consists of a solution of cellulose ester in acetone, etc., to which is added a hygroscopic substance such as chloride of zinc, calcium, magnesium, or tin, or a mixture of these chlorides. The chloride lowers the viscosity of the dope, so that a smaller quantity of solvent can be used—for instance, 20 per cent. In one example, 1 to 5 per cent. of calcium chloride is added to a solution of celluloid in acetone, alcohol, and benzole. In another example, in which the dope contains 10 per cent. of celluloid, one or more of the above-mentioned chlorides are added in such a proportion that the mixture contains from $\frac{1}{2}$ to 1 per cent. of combined chlorine. In another example, a mixture in molecular proportions of calcium chloride and zinc chloride dissolved in alcohol is added to the dope, the solution having been first neutralised by being boiled with zinc.

Catalytic Apparatus. E. B. Maxted and T. A. Smith, Walsall, Staffordshire. British Patent, 128,623, of 1917.

In a high-pressure furnace for conducting chemical reactions such as the synthesis of ammonia, combustion is effected in a chamber separate from the reaction chamber, and at a pressure approximately the same as that at which the reaction takes place. The apparatus shown comprises a strong steel shell A lined with non-conducting material B. Combustible gas and air are supplied to the chamber K through pipes H, N respectively, and the products escape through a coil L and a relief valve P loaded to blow off at the desired pressure. The nitrogen-hydrogen mixture is supplied by the pipe R, and is circulated by a pump E through the pipe F, over the coil L, and combustion chamber K, through catalytic material C', and back to the pump. When the mixture is used as the combustible gas, a portion is supplied through the non-return valve G

to the combustion chamber K. The ammonia produced is absorbed between the outlet D and the pump E. The combustion chamber may surround the reaction chamber, and the pressure in the latter may be utilised for controlling the valve P.

Purifying Oils.—W. J. Mellersh Jackson, London. A communication from the Twitchell Process Company, Cincinnati, U.S.A. British Patent, 127,159, of 1918.

After petroleum oils have been treated with sulphuric acid to remove unsaturated hydrocarbons and the acid sludge separated in the ordinary way, the oil is treated with sodium hydroxide or other alkali to neutralise dissolved sulpho-acids, and the salts thus formed are extracted by means of a dilute solution of a solvent soluble in water, such as alcohol or acetone. A fifty per cent. solution of methyl alcohol is mentioned as suitable.

Picric Acid, Etc. British Dyes, Ltd., J. Turner, and L. G. Badier, Huddersfield. British Patent, 126,368, of 1917.

Picric acid is prepared by nitrating phenol trisulphonic acid by concentrated nitric acid in concentrated sulphuric acid solution with the addition of water or steam; the water or steam assists in the replacement of the sulphonic groups by nitro groups. Phenol trisulphonic acid is obtained by sulphonating phenol with a mixture of concentrated and fuming sulphuric acid. *p*-Nitrophenol disulphonic acid is formed as an intermediate product of the nitration.

ABSTRACTS OF LATEST SPECIFICATIONS OPEN TO PUBLIC INSPECTION BEFORE ACCEPTANCE.

Sulphur-burners. M. Krotoff, Haute Vienne, France. British Patent, 128,549. Convention date, June 15, 1918.

To produce a gas rich in sulphur dioxide by the burning of sulphur, regulable quantities of finely powdered sulphur are introduced by the pipe *s* into a blast of air injected into a furnace by the pipe *t*, the resulting sulphur dioxide escaping by the outlet *b*. The furnace *k* comprises a series of concentric tubes upon a hearth *f*. Preheating of the furnace is necessary to start the reaction, but once started, the heat evolved is sufficient to maintain it. The apparatus is stated to be applicable to the combustion of any solid substance for the purpose of producing a gaseous product.

Halohydrins. Commercial Research Company, New York, U.S.A. British Patent, 128,578. Convention date, June 20, 1918.

Halohydrins such as chlorhydrins are prepared by subjecting gaseous unsaturated hydrocarbons such as olefines, under pressure, to the action of an aqueous solution of hypochlorous or similar acid. The reaction is effected in a vessel A filled with an inert packing. Hydrocarbon gases are pumped through an inlet D, and excess escapes through a valve *f* and meter G. Hypochlorous acid solution is sprayed into the vessel A from a pipe H by a pump I. The chlorhydrin solution is discharged by a pipe B to a storage vessel C, from which it may be passed through an apparatus in which hypochlorous acid is formed, and thence is returned to the vessel A to obtain a stronger solution of chlorhydrins. The hypochlorous acid is formed

by passing water or chlorhydrin solution from the vessel C into a mixing-vessel O containing a salt of a weak acid such as sodium bicarbonate, borax, etc., or a mixture of sodium bicarbonate and boric acid, or a basic salt such as magnesium oxychloride. The solution obtained is passed by a pipe P down to a stone-ware column Q, up which chlorine is passed from a container U through a meter T. Excess of chlorine escapes by a pipe *q*. Salts of hypochlorous acid such as magnesium, calcium, or aluminium hypochloride may be used. The gases containing ethylene and propylene obtained by cracking petroleum may be treated by passage in succession through two vessels into which hypochlorous acid is sprayed to obtain propylene chlorhydrin from the first and ethylene chlorhydrin from the second.

Recovering Volatile Solvents. J. H. Brégeat, Paris. British Patent, 128,640. Convention date, May 25, 1917.

Certain volatile solvents used in manufacture are recovered from gaseous mixtures containing them, by absorption in phenolic reagents, such as crude carboic acid or crude cresols, and subsequent distillation and condensation. The solvents in question are:—Methyl alcohol, amyl alcohol, ethyl acetate, amyl acetate, carbon tetrachloride, chloroform, di-, tri-, or tetra-chlorethylene, tetra- and penta-chlorethane, petrol.

Using the apparatus shown, the vapours are washed by a counter current of cresols in the absorption column 2, and the cresol charged with the volatile bodies is pumped to the tank 6, and then flows through a heat-exchanger 7 to a steam heater 8 and cascade evaporator 9 heated by steam from a pipe 21; the volatile bodies pass off with the steam to a distilling column 10, where they are rectified, and thence to condensers 11, 12. The cresols, deprived of the volatile bodies, flow from the evaporator 9 to the heat-exchanger 7, and thence to the cooler 14, and so back to the storage tank 1 for reuse.

REPORTS OF COMPANIES.**British Dyestuffs Corporation, Ltd.**

The statutory meeting of British Dyestuffs Corporation was held on Tuesday at Winchester House, E.C. Sir Henry Birchenough, K.C.M.G., who presided, pointed out that the meeting was purely a formal one, and in answer to questions said that 9,900 applications were received from the public in response to the prospectus, representing 3,276,000 shares, or approximately two-thirds of the whole issue; 876 applications were subsequently received from the underwriters, representing approximately one-third of the issue. In view of the fact that the prospectus was issued immediately after the Victory Loan, and that the industrial outlook at the time in view of the coal strike in Yorkshire was not very favourable, the directors considered the response on the part of the public extremely satisfactory. The total number of shareholders was now approximately 12,000. In regard to the works at Huddersfield, they were designed under the best possible advice as dyeworks, but during the war a large portion had been used for the production of high explosives. He considered the prospects of competing with the German trade were very satisfactory, and that with their modern works and the loyal co-operation of the textile trades they would be able to satisfy the requirements of the whole industry throughout the British Empire, more particularly India.

Mr. Fay inquired if any foreign dyes were at present coming into this country, and if so, from what source?

Lord Moulton said that foreign dyes were coming into this country from Switzerland, but only in small quantities. He believed none were coming in from any other source, and these were coming in relief of the needs of England, because it took some time before the full list of dyes could be produced.

Mr. Beaumont asked if it were not the fact that a good quantity of dyes were coming here from Germany through America?

The Chairman replied that the board had no positive knowledge, but he did not think any dyes were coming into this country at the present time from Germany by way of America.

A number of other questions having been answered, the proceedings closed with a vote of thanks to the chairman.

London Nitrate Company, Ltd.

An extraordinary general meeting was held at Liverpool on August 22, Mr. Frank Tobin, the chairman, presiding, when the following resolution was unanimously passed: "That the directors be and they are hereby authorised to borrow from time to time an amount not exceeding in the aggregate £400,000, at such times, upon such security (if any), and otherwise upon such terms and conditions as the directors may from time to time think fit."

British Vegetable Oil Extraction Company, Ltd.

Report for the year to December 31 states that the operations of the company have continued under the control of the Ministry of Food, and the same difficulties as to class, quantity, and quality of raw material allocated have been experienced as foreseen in the last report. The refinery treated over 4,000 tons of crude oil, and over 1,100 tons of seeds and cake were crushed in the mill. These amounts represent about half of the present capacity of the refinery and about one-seventh of the present capacity of the mill, and it will be readily understood that it was impossible to make a profit on a large plant with only such a small turnover. The loss on the year's working was £28,098., which, with administration expenses and interest on loans, makes a total debit balance of £63,425.

TRADE INQUIRIES.

The following inquiries have been received at the Department of Overseas Trade (Development and Intelligence), 4, Queen Anne's Gate Buildings, London, S.W. 1, whence, unless otherwise stated, further information may be obtained:—

Australia.

A Melbourne firm of indentors and importers desire to secure the representation, for Victoria, of United Kingdom manufacturers of heavy chemicals. (Reference No. 412.)

Canada.

H.M. Trade Commissioner at Winnipeg reports that a well-known wholesale company in Edmonton, Alberta, is desirous of securing exclusive agencies in Alberta, Saskatchewan, and British Columbia, for United Kingdom manufacturers of proprietary preparations in druggists' goods, chemicals, and artists' materials. (Reference No. 420.)

South Africa and Rhodesia.

A partner in a firm of South African agents, claiming to have had lengthy commercial experience, is at present in this country, and desires to secure additional agencies for United Kingdom manufacturers of dyes for the Union and Rhodesia. (Reference No. 431.)

A Port Elizabeth firm having their head office in the United Kingdom, and claiming to be in close touch with the principal merchants, storekeepers, and farmers in South Africa, desire to secure agencies, for the Union and Rhodesia, of United Kingdom exporters of fertilisers, Stockholm tar, linseed oil, axle grease, bluestone, caustic soda, and saltpetre. (Reference No. 432.)

British West Indies.

A manufacturers' agent at Port of Spain, Trinidad, desires to get into touch with United Kingdom suppliers of laundry soap, with a view to representing them, for sales on commission, in the West Indies and British Guiana. (Reference No. 433.)

Belgium.

A Belgian inquirer desires an agency for United Kingdom producers of coal and pitch. (Reference No. 435.)

Spain.

A British firm in Barcelona desire to secure agencies for United Kingdom firms exporting metals and raw materials. (Reference No. 467.)

H.M. Commercial Secretary, Madrid, reports that a firm of commission agents in that city desires to represent British exporters of fertilisers. (Reference No. 468.)

Switzerland.

A general commission agent in Lausanne wishes to secure the agencies in Switzerland of United Kingdom manufacturers and exporters of coal and patent fuel, oils, varnishes, paints, edible oils, and soaps. (Reference No. 473.)

A general commission agent at Bâle wishes to secure the representation, for Switzerland, of United Kingdom exporters of rubber, chemicals, and raw materials. (Reference No. 475.)

A British commission agent in Lausanne wishes to get in touch with United Kingdom manufacturers and exporters of chemicals, drugs, and disinfectants. (Reference No. 482.)

Chili.

A general commission agent and importer of Santiago is shortly visiting this country. He is interested in importing the following articles into Chili: Caustic soda, soda ash, paraffin wax, and raw materials for Chilean industries. (Reference No. 492.)

Cuba.

A wholesale druggist (British) in Havana wishes to get into touch with United Kingdom manufacturers of drugs and chemicals, with a view to acting as their agent in Cuba. (Reference No. 495.)

MARKET REPORTS.**TAR AND AMMONIA PRODUCTS.****WEDNESDAY.**

Benzole: London, 90%, 2s.; North, 1s. 10d. to 1s. 11d., 50%, 1s. 10d.; North, 1s. 9½d.; naked. Carbolic acid, crude, 60%, East and West Coast, nominally 1s. 6d. to 1s. 7d.; crystals, 39-40%, 9d. to 9½d., f.o.b. Crude tar, London, 45s. to 50s.; Midlands, 44s. to 46s.; North, 45s. per ton, ex works. Pitch 72s. 6d. to 75s.; East Coast, 65s. to 70s. f.o.b.; West Coast, 55s. to 57s. 6d., f.a.s. Solvent naphtha, naked, London, 90-100%, 2s. 5d.; North, 2s. 3d. to 2s. 4d.; 90-160%,

naked, London, 2s. 3d.; North, 2s. to 2s. 1d. Crude naphtha naked, 30%, 9d.; North, 8d. to 8½d. Refined naphtha-line, £16. to £18.; salts, £6. to £7. Toluol, naked, London, 2s. 6d.; North, 2s. 5d. Creosote, naked, London 6½d.; North, 5½d. to 6d.; heavy oil, 6½d. to 7d. Anthracene, 40-45%, 7d. per unit. Cresylic acid, 95%, 2s. 5d. to 2s. 6d.; 97-99%, 2s. 7d. to 2s. 8d., ex works, London, and f.o.b. other ports. Sulphate of ammonia; home trade, £19. 10s. per ton; basis 24½%. Nitrate of soda, £21. to £22.

LONDON METAL MARKET.

THURSDAY.

Copper: Standard brands, £98. 10s. to £99. cash. £99. 10s. to £100. three months; electrolytic, £110 to £120. Tin: Standard, £271. 10s. to £272.; cash, £267. 5s. to £267. 10s. three months; Straits, £275. 10s.; English, £268. Lead: Soft foreign, £24. 15s.; English, £26. Spelter, £38. 10s.; hard, £29. to £30. Antimony, English regulus, 90%, £42. Aluminium, £150.; Nickel, £205. delivered, packages extra. Quicksilver, £23. 10s. Bismuth, 12s. 6d. Platinum, 442s. per oz. Wolfram, 30s. per unit.

MANCHESTER CHEMICAL MARKET.

THURSDAY.

There is a continued good demand for heavy chemicals, both for home and export trade, and values generally appear to be settling down on a more stable level. Small lots of resale caustic soda, 58% alkali, and refined bicarbonate of soda, however, are still available at recent rates. Bleaching powder quiet, but price steady at £15. softwoods, on rail. For hardwoods £14. f.o.b. is about current value. Saltcake, firm at 60s. per ton, carriage paid. Chlorate of soda, lower at 6½d. per lb. Potash, quiet at 1s. per lb. Recovered rock sulphur, easy at £17, on rail. Home trade prices for bichromates are unaltered at 1s. 6d. and 11d. per lb., respectively, for potash and soda. For sulphate of copper there is no demand, and price remains nominal at £43. f.o.b. Commercial hyposulphite of soda, steady at £16. 10s. Phosphate, £26. per ton. There is no inquiry for concentrated sodium sulphide, and quotation is easy at £18 10s. per ton. Arsenic, still in short supply, and price higher at £58. per ton. Yellow prussiate of potash, dull at 1s. 9d. per lb. Soda, firmer at 7d. per lb. Carbonate of potash is well maintained at recent quotations. There is an improved demand for lead salts, and white acetate is firm at £83. per ton. Brown, lower at £70. Nitrate, £56 per ton. English brown acetate of lime is scarce and firm at £11. per ton; grey, £17. per ton. Miscible and solvent wood naphtha have a downward tendency. Quotations for acetate of soda and acetic acid are well maintained, and there is a fair inquiry. All zinc, tin, and ammonia salts are moving off steadily. Oxalic acid unaltered at 1s. 2½d. per lb.

TURPENTINE MARKET REPORT.

Messrs. James Watt and Son, Limited, of 101, Leadenhall Street, London, E.C.3, report that the stocks of turpentine on August 23 were: American, 32,283 barrels, compared with 6,564 barrels at the corresponding date of 1918; French 45 barrels (14 barrels); and Spanish, 618 barrels (1,535 barrels). Deliveries during the week ended August 23 were 1,750 barrels, against 520 barrels last year, and since January 1, 46,865 barrels, compared with 16,736 barrels in 1918. The price on Saturday last was 127s. 6d. per cwt., compared with 120s. at the corresponding date of last year. September-December delivery was quoted at 128s. 6d. and January-April (1920) 131s.

SWANSEA MARKET REPORT.

THURSDAY.

Timplate prices are unchanged with fair business in export quarters. Copper irregular with a tendency to weaken at £98. per ton prompt and £99. three months. There was an easier tone in tin and a little business was transacted at £272. per ton for prompt and £268. 10s. three months. Lead prices steady and quiet: Spanish at £24. 17s. 6d. per ton prompt and slightly dearer forward; English at £26. Spelter quiet and easier at £39. 5s. 0d. prompt and £40. forward. Zinc sheets £64. f.o.b. New York. English sheets £66. Silver 60½d. per ounce. Quicksilver £23. 10s. 0d. per bottle. Antimony nominal with English regulus 90%, at £42. prompt. Nickel £205. per ton delivered London or equal. Aluminium £150. Bone meal 15s. 3d. per cwt. in bags. Pitch scarce and firm at 53s. per ton. Nitrate of soda quiet and steady at 21s. 6d. per cwt. in bags. Sulphate of ammonia remains very steady at £19. 10s. per ton f.o.r. over current quarter. Sulphate of copper quiet at £43. 10s. per ton for home and export trade in casks f.o.b. less 5%.

LIVERPOOL CHEMICAL MARKET.

THURSDAY.

Chemicals have, on the whole, been more in demand, inquiries having come in more freely for home trade uses, and to a very fair extent on overseas account. Ship painters are on strike, but this strike may end any moment, while a joiners' strike that has dragged wearily on for nearly three months seems to be flickering out from sheer exhaustion. With these exceptions, the first of which may affect the sale

of leads and colourings somewhat, the labour situation in the district is much more settled, and an easier feeling in respect of it prevails in business circles. Bleaching powder has been in very fair demand, and in good supply. Prices are £14. 10s. to £15. per ton, free on rail or conveyance, in buyers' packages, and £17. per ton, for export. Chloride of calcium has been rather more in request, and is £8. to £11. per ton, in casks, f.o.r. Caustic soda has sold more freely, especially on export account. Prices are £24. per ton for 76%; £22. per ton for 70 to 72%; and £19. per ton for 60 to 62%. Nitrate of soda has been quieter, and is £20. 10s. to £21. 10s. per ton. Saltcake has been in good request, and is £6. 10s. per ton, in casks, f.o.b. Soda crystals have been well inquired for and are £5. per ton in 2cwt. bags, f.o.r. at works. Bicarbonate of soda has been in good request, and is £7. 5s. to £10. per ton, according to terms of delivery. Borax has been in rather active demand but has been in very short supply for prompt delivery. Ordinary, is £42. per ton, and powdered £44. per ton, in bags. Ammonia alkali continues to be well inquired for and is £6. to £6. 5s. per ton, f.o.r. at works. Hyposulphite has been rather more in request and is £17. per ton for ordinary and £22. per ton for pea crystals. Sulphite of sodium has been quiet and is £10. per ton for ordinary, and £16. to £18. per ton for pea crystals, in 1cwt. kegs. Bichromate of soda has had a fair inquiry and is 9d. per lb. Phosphate of soda has been in somewhat better request and is £25. per ton. Sulphide of sodium has been in moderate demand and is £20. per ton in casks, and £22. per ton, in drums. Chlorate of potash has been rather more in request, and is 1s. 1d. to 1s. 3d. per lb. Permanganate of potash has again been in fair demand, and is 3s. 6d. per lb. Sulphate of potash has been very quiet and is £40. per ton. Carbonate of potash has had a moderate inquiry and is £90. to £95. per ton for 80 to 85%. Caustic potash has been in good request and is £110. to £120. per ton. Nitrate of potash has been more inquired for and is £55. to £60. per ton for refined and £40. per ton for ordinary. Canadian potashes have been very quiet. Montreal first quality are £200. to £220. per ton and second quality £190. to £210. per ton. Bichromate of potash has been rather more in demand, and is 1s. 6d. to 1s. 7d. per lb. Yellow prussiate of potash has been in moderate request, and is 1s. 9d. to 1s. 10d. per lb. Salammoniac has been in steady demand, and is £80. per ton for lump, £75. per ton for seconds, and £5. per ton extra for ground. Sulphate of ammonia has been but little in request, and is £19. 10s. per ton, less trader's discount of 10s. per ton, free to nearest wharf or station, to September 30. Carbonate of ammonia has been in quietly steady demand, and is 6½d. per lb. Muriate has been but little called for and is £50. to £60. per ton, according to quality. Magnesia has been in very fair request. Carbonate is £3. per cwt., and sulphate £10. to £16. per ton, according to grade. Alum has been well inquired for but has been very scarce for early delivery. Prices are, £18. 10s. per ton for the home trade, and £18. 10s. to £19. 10s. per ton for export. Aluminoferrie has been very quiet and is £8. 10s. to £12. per ton, according to quality. Sulphate of alumina has been inactive and is £12. to £17. per ton, according to grade. Sulphur has been called for rather freely. English kinds are: Flowers, £32. per ton; roll, £28. per ton, and rock, £22. per ton, in bags, f.o.r. Sicilian grades are: Flowers, £28. per ton; roll, £22. 10s. per ton; and rock, £17. 15s. per ton. Cream of tartar has had a fairly free sale and is £11. 10s. to £11. 15s. per cwt. Tartaric acid has been in very fair demand and is 3s. 1d. per lb. Boracic acid has been rather more inquired for, and is £72. per ton for crystals, and £74. per ton for powdered. Oxalic acid has been quiet and is 1s. 3d. per lb. Citric acid has been in quietly steady demand and is 4s. 4d. per lb. White acetate of lead has been but little in request and is £85. to £90 per ton. Arsenic has been quiet, and has been very scarce. The price continues very firm and may be given as £50. per ton for white powdered. Sulphate of copper has been inactive and is £14. per ton for farm purposes in the United Kingdom, and £43. per ton, less 5%, in casks, f.o.b. at Liverpool.

TYNE CHEMICAL REPORT.

TUESDAY

Heavy chemicals (particularly caustic soda and bleaching powder) continue in good inquiry and trade generally is better—there is a strong demand also for soda crystals locally at £5. per ton in 2cwt. bags. Sulphur still very scarce, and firm at £23. and £24. per ton.

The following prices are per ton net:—Bleaching powders, softs and hards, £15. per ton; caustic soda 74/77%, £23. 5s., do., 70%, £22., do., 60%, £20.; recovered sulphur, 2cwt. bags, £24.; hyposulphite of soda, 5/7cwt. casks, £19., 1cwt. kegs, £25.; sulphite of soda, 5/7cwt. casks, £12.; do., 1cwt. kegs, £20.; silicate of soda, 75Tw., £9. 12s. 6d., do., 100Tw., £10., do., 140Tw. £10. 10s.; soda crystals, 2cwt. bags, £5.; sulphate of soda (salt cake) in bulk, £3. 10s.; pure white sulphate of alumina, 14/15%, £19. 10s.; blanc fixe, £22.; chloride of barium, £27.; sulphide of sodium, crystals, £18. do., refined concentrated solid, 60/62%, £25.; hydrate of barium, crystals, £56.

COALS.—Market is very strong, with continued heavy requisitioning on official account, with the result that there is little coal offering for outside markets. Prices are ruling high:—Best Northumberland steam coals, 95s. to 100s. per ton., second qualities, 90s.; Northumberland small coals, 70s. to 75s., seconds, 60s. to 65s.; best Durham gas coals, 72s. 6d. to 75s., seconds, 65s. to 70s.; bunker coal (for metals) 72s. 6d. to 75s., gas coke, 80s. to 85s.

WEST OF SCOTLAND CHEMICALS.

GLASGOW, Wednesday.

During the past week business has been fairly good and the undertone in the market has been steady. Some important deals are reported to have been carried through and prices generally indeed are few and far between and current values

are still rated as follows:—Arsenic, £55. per ton net, Glasgow: bicarbonate of soda, £8. 15s. and £10. per ton for 6-8 casks and 1cwt. kegs, Liverpool: boracic acid crystals, English refined, £72. for 2cwt. bags, and borax crystals, £39. for 2cwt. bags, carriage paid: caustic soda, white, 70-72%, £24. per ton, net Glasgow; chlorate of potash, 1s. 1d. per lb. net, Glasgow: chlorate of soda, £3. 4s. per cwt. net, Glasgow: citric acid, 4s. 4d. per lb. 5% Glasgow: cream of tartar 98% £11. 5s. per cwt. net, Glasgow: paraffin wax, U.K. deliveries 125°, 6½d. to 6¼d., 121-30, 5½d. to 5¼d., 118-20°, 5½d., 110-12°, 4d. to 4½d., and 98-102° 4d. to 4½d.; salammoniac, £80. and £75. per ton, net, any port, for first and second lump respectively: salammoniac crystals, £85. per ton, net, Glasgow: saltpetre, £3. 4s. net, Glasgow: tartaric acid, 3s. 1d. per lb., 5% Glasgow.

Among the sea oils there is still a pronounced scarcity of whale oils and the only variety at present on offer continues to be black—which is still going into consumption at 78s., its old quotation. Pale, yellow and brown are not on offer at all. Newfoundland cod and pale seal are also blank as far as the market is concerned, but there has been a supply of Menhaden going at 86s.

There is no change of consequence so far as the coal trade is concerned and demand keeps fairly steady. Supplies generally are sufficiently plentiful to meet demand, and, if anything, the requirements for both industrial and domestic purposes are now heavier. There is little or nothing doing from the export standpoint and home requirements still take the monopoly.

IMPORTS OF CHEMICAL PRODUCTS

AT THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

BRISTOL.

*Publication of Official Returns
Suspended.*

GLASGOW.

Week ending August 23.

- SODA CRYSTALS**—
Antofagasta, 100 pkgs.; Bombay, 250 pkgs.
- SODIUM BICARBONATE**—
Abo, 100 pkgs.; Aden, 37 pkgs.; Amsterdam, 150 pkgs.; Antofagasta, 10 pkgs.; Bombay, 400 pkgs.; Colombo, 360 pkgs.; Christiania, 120 pkgs.; Cochín, 1,000 pkgs.; Dunedin, 40 pkgs.; Fremantle, 66 pkgs.; Lisbon, 60 pkgs.; Melbourne, 21 pkgs.; Patras, 100 pkgs.; Pt. of Spain, 50 pkgs.; Salonica, 40 pkgs.; Santos, 100 pkgs.; San Fernando, 12 pkgs.; Singapore, 150 pkgs.; Timaru, 20 pkgs.; Varna, 230 pkgs.
- SODIUM BICROMATE**—
San Juan del Sur, 4 c., £8.
- SODIUM CYANIDE**—
Barranquilla, 25 pkgs.; La Union, 50 cs.; Secondee, 210 pkgs.
- SODIUM SILICATE**—
Alexandria, 64 pkgs.; Amsterdam, 100 pkgs.; Balik Pappan, 3 pkgs.; Boston, 20 pkgs.; Calcutta, 48 pkgs.; Cape Town, 20 pkgs.; Manzanillo, 156 bgs.; Montreal, 82 pkgs.; Penang, 16 pkgs.; Rotterdam, 100 pkgs.; Samarang, 20 pkgs.; Santos, 50 pkgs.; Secondee, 64 cks.; Valparaiso, 100 pkgs.
- SODIUM SULPHATE**—
Kilindini, 10 c., £9.
- STEARINE**—
Durban, 89 brls.; Patras, 16 bgs.
- SULPHUR (FLOWERS)**—
Calabar, 5 c., £9.
- SULPHURIC ACID**—
Arica, 1 c., £4.; Valparaiso, 7 c., £14.
- SUPERPHOSPHATE (otherwise undescribed)**—
Montreal, 30 t.; S. Cruz, 59 t.
- SUPERPHOSPHATE OF BONE**—
Las Palmas, 197 bgs.
- SUPERPHOSPHATE OF LIME**—
Antwerp, 9 t. 17 c., £99.
- TALLOW**—
Accra, 20 pkgs.; Alexandria, 10 brls.; Antwerp, 6 pkgs.; Rotterdam, 68 pkgs.
- TAR**—
Beira, 1 c., £2.
- TAR (STOCKHOLM)**—
Opobo, 5 c., £8.
- TARTARIC ACID**—
Stanley, 2 c., £12.
- WAX**—
Samarang, 6 pkgs.; Valencia, 14 bgs.
- WHITE LEAD**—
Christiania, 2 t. 2 c.
- WOOD PRESERVATIVE**—
Barbados, 1 t. 18 c., £45.; Batavia, 10 c., £25.
- ZINC CHLORIDE**—
Adelaide, 18 c., £72.; Alexandria, 6 t. 6 c., £328.; Melbourne, 9 c., £23.; Sydney, 9 c., £24.
- ZINC SULPH**—
Wellington, 5 c., £7.

LONDON.

Week ending August 20.

- ACETIC ACID**—
Alexandria, 1 ck., £20.; Athens, (F.), 2 cbys., £9.; Amsterdam, 1 cs., £10.; Bombay, 19 cs. (pt.), £5.; Jaffa, 2 cs., £8.; Piraeus, 3 brls., £50.; Rotterdam (F.), 17 cks., £200.; Toronto, 2 cs., £6.
- ACETO SALICYLIC ACID**—
Amsterdam, 2 cs., £180.; Alexandria (F.), 2 cs. (pt.), £22.; Melbourne, 1 cs. (pt.), £23.; Shanghai (F.), 1 cs., £15.; Sydney, 1 cs., £23.
- ACETONE**—
Amsterdam, 2 drms., £6.
- ALUM**—
Maceio, 6 c., £8.; Pt. Elizabeth, 11 c., £18.
- ALUM (CHROME)**—
Cape Town, 1 ck., £7.; Bombay, 1 kg., £10.
- ALUMINA HYDRATE**—
Paris, 1 ck., £6.
- ALUMINA SULPHATE**—
Barranquilla, 9 c., £15.
- ALUMONIA**—
Alexandria, 2 drms., £34.; Antwerp, 29 drms., £360.; Beira, 6 cs., £12.; Brussels, 8 cs., £16.; Calais, 34 drms., £301.; Cape Town, 28 cs., £56.; Colombo, 8 cs., £17.; Demerara, 4 cs., £6.; Durban, 10 cs., £20.; Hankow, 4 cs., £8.; Hong Kong, 8 cs., £14.; Malta, 8 cs., £16.;

AMMONIA—
Rangoon, 5 cs., £10.; Santos,
6 cs., £16.

AMMONIA (ANHYDROUS)—
Antwerp, 15 cylds., £131.; Hong
Kong, 5 cylds., £61.; Karachi,
4 cylds., £51.; Singapore, 2 cylds.,
£26.

AMMONIUM ACETATE
Hong Kong, 28 pkgs., £6.

AMMONIUM BROMIDE—
Bombay, 1 cs. (pt.), £8.

AMMONIUM CARBONATE—
Antwerp, 15 pkgs., £60.; Ant-
werp, Switzerland, via, 12 c.,
£38.; Bahia, 2 c., £10.; Cal-
cutta, 10 c., £62.; Constanti-
nople, 18 c., £103.; Maceio,
2 c., £11.; Melbourne, 1 c., £12.;
Paris, 2 t., £125.; Penang, 2 c.,
£15.; Porto Alegre, 15 c., £66.;
Rio de Janeiro, 5 t. 1 c., £483.;
Sao Paulo, 2 c., £11.; Sydney,
1 t., £67.

AMMONIUM CHLORIDE—
Constantinople, 2 cks., £24.;
Calcutta, 2 cs., 1 cs. (pt.), £26.

AMMONIUM HYDRATE—
Calcutta, 1 cs. (pt.), £11.

AMMONIUM MOLYBDATE—
Paris, 3 cs., £191.

AMMONIUM MURIATE—
Alexandria, 4 c., £18.; Bombay,
5 t. 2 c., £369.; Constantinople,
5 c., £21.; Malta, 3 c., £12.

AMMONIUM NITRATE—
Melbourne, 40 t., £1,000.

AMMONIUM SULPHATE—
Dunkirk, 90 t., £2,250.

AMYL ACETATE—
Adelaide, 1 cs., £10.; Melbourne,
1 dm., £12.

ANTIMONY OXIDE—
Alexandria, 1 cs. (pt.), £7.

ANTIMONY PERCHLORIDE—
Melbourne, 1 cs., £5.

ANTIMONY REGULUS—
Antwerp, 10 t.; Rotterdam, 10 t.

ANTIMONY SULPHIDE—
Antwerp, 2 cks., £41.; Boulogne,
6 cks., £72.; Brussels, 3 cks.,
£168.; Genoa, 2 cks., £35.;
Lisbon, 15 cks., £135.; Montreal,
1 cks., £62.; New York, 10 cks.,
£151.

ANTIMONY TARTRATE—
Santos, 1 ck., £9.

ARSENIC—
Beyrouit (F.), 10 c., £32.;
Salonica, 4 c., £11.

BARBITONE—
Sydney (F.), 1 cs. (pt.), £35.

BARIUM NITRATE—
Bombay, 15 cks., £98.

BARIUM SULPHIDE—
Alexandria, 1 cs. (pt.), £8.;
Calcutta, 1 cs. (pt.), £5.; Mel-
bourne, 1 cs., £6.

BISMUTH CARBONATE—
Bangkok, 1 cs. (pt.), £9.; Cape
Town, 2 cs. (pt.), £33.; Con-
stantinople, 1 cs. (pt.), £18.;
Melbourne, 1 cs., £41.; Penang,
1 cs. (pt.), £6.; Rotterdam, 1 cs.
(pt.), £17.; Sydney, 2 cs. (pt.),
1 cs., £197.

BISMUTH OXIDE—
Sydney, 2 cs. (pt.), £11.

BISMUTH SALICYLATE—
Sydney, 1 cs. (pt.), £19.

BISMUTH SALTS—
Amsterdam, 1 cs. (pt.), £8.;
Adelaide, 1 cs. (pt.), £44.

BISMUTH SUBGALLATE—
Amsterdam, 1 cs. (pt.), £25.;
Rotterdam, 1 cs. (pt.), £84.

BISMUTH SUBNITRATE—
Penang, 1 cs. (pt.), £6.; Rotter-
dam, 2 cs. (pt.), £190.; Sydney,
2 cs. (pt.), £29.; Switzerland,
6 cs., £455.; Trondhjem, 1 cs.
(pt.), £47.

BISMUTH SUBSALICYLATE—
Odense, 2 cs. (pt.), £114.; Rotter-
dam, 1 cs. (pt.), £23.

BISMUTH TANNATE—
Rotterdam, 1 cs. (pt.), £5.

BORAX—
Aden, 5 c., £11.; Antwerp,
19 t. 15 c., £775.; Bocas del
Toro, 1 c., £5.; Constantinople,
16 c., £48.; Dantzig, 9 t. 17 c.,
£403.; Fremantle, 8 t., £800.;
Gibraltar, 10 c., £20.; Hamburg,
5 t. 2 c., £284.; Maceio, 2 c.,
£5.; Madras, 8 c., £42.; Malta,
13 c., £27.; Mauritius, 5 c., £10.;
Paris, 10 t., £390.; Rotterdam,
45 t. 10 c., £1,883.; Salonica,
10 c., £20.; Shanghai, 5 c., £15.;
Singapore, 10 c., £26.; Sydney,
2 t., £210.

BORIC ACID—
Alexandria, 2 c., £11.; Bangkok,
2 c., £10.; Calcutta, 5 c., £23.;
Cape Town, 2 c., £8.; Canton,
1 c., £6.; Constantinople, 3 c.,
£17.; Copenhagen, 4 c., £11.;
Dantzig, 2 t. 19 c., £220.;
Latakia, 2 c., £6.; Maceio,
2 c., £9.; Malta, 2 c., £12.;
Penang, 1 c., £5.; Rio Grande
do Sol, 5 c., £26.; Rotterdam,
12 c., £43.; Rotterdam,
1 t., £83.; Shanghai, 7 c., £39.;
Wellington, 1 c., £5.

CALCIUM CHLORIDE—
Boulogne, 10 t., £90.; Rangoon,
12 c., £29.

CALCIUM GLYCEROPHOSPHATE—
Alexandria (F.), 2 cs. (pt.), £47.

CALCIUM HYPO—
Rotterdam, 1 cs. (pt.), £5.

CALCIUM LACTATE—
Adelaide, 1 cs. (pt.), £6.; Mel-
bourne, 1 cs. (pt.), £8.

CALCIUM OXIDE—
Calcutta, 1 cs. (pt.), £6.

CARBIDE—
Bukuru, 1 t. 1 c., £25.; Pt.
Harcourt, 11 c., £12.; Secondee,
18 c., £24.

CARBONATE OF LIME—
Barcelona, 21 bgs., £27.

CARNAUBA WAX—
Amsterdam, 5 c.

CAUSTIC POTASH—
Adelaide, 1 cs., £29.; Bombay,
1 cs., £11.

CAUSTIC SODA—
Osaka, 5 t., £150.; Secondee,
5 c., £10.

CERESINE WAX—
Amsterdam, 3 t. 8 c.; Antwerp,
5 t. 16 c.; Calais, 6 c.

CHEMICALS (otherwise undescribed)
Alexandria, 1 cs., £12.; Abo,
2 cs. (pt.), £22.; Adelaide, 12
pkgs., £115.; Alicante, 1 cs.
(pt.), £43.; Amsterdam, 13
pkgs., £142.; Brussels, 4 pkgs.,
£138.; Brussels, 17 pkgs., £214.;
Bangkok, 4 cs., £31.; Beira, 1 cs.,
£9.; Buenos Ayres, 1 cs., £31.;
Italy, via Calais, 14 pkgs., £165.;
Brisbane, 1 cs., £11.; Colombo,
8 cs., £22.; Delagoa Bay, 2
pkgs., £35.; Durban, 10 pkgs.

Lagos, 1 ck., £10.; Latakia,
8 pkgs., £24.; Melbourne, 25
pkgs., £286.; Ostend, 1 cs., £70.;
Penang, 5 cs., £51.; Rio de
Janeiro, 2 cs., £106.; Sydney,
8 pkgs. (pt.), £159.

CHRYSOGRAPHIC ACID—
Paris, 2 cs. (pt.), £78.

CITRIC ACID—
Alexandria, 1 cs. (F.), £11.;
Bombay, 6 c., £137.; Calcutta,
3 c., £88.; Madras, 1 c., £13.;
Montreal, 1 c., £24.; New York,
8 c., £3,770.; Wellington (liquid),
10 c., £80.

COAL PRODUCTS—
Aniline Dye
Adelaide, 3 cs., £59.; Bombay,
26 pkgs. (pt.), £603.; Durban,
1 kg., £20.; Genoa, 5 pkgs.,
£216.; Melbourne, 33 pkgs.,
£1,496.; Sydney, 13 pkgs., £518.

COAL PRODUCTS—
Benzonaphthol
Santiago (Chile), 1 cs. (pt.), £11.
Bitumen
Bombay, 113 cks., £800.
Bitumen Solution
Beira, 20 drms., £76.

Carbolic Acid
Adelaide, 45 pkgs., £50.; Alex-
andria, 1 dm., £17.; Athens,
2 cs., £12.; Bathurst, 13 cs.,
£16.; Brussels, 3 cs., £8.;
Copenhagen, 2 cs., £11.; Kobe,
92 pkgs., £735.; Osaka, 68
drms., £590.; Switzerland, 7
kgs., £70.; Rotterdam, 6 drms.,
£9.; Yokohama, 93 pkgs., £742.

Cressol
New York, 100 cks., £883.;
Swatow, 7 cks., £37.

Cressote
Delagoa Bay, 125 drms., £78.

Dimethylaniline
Granada (F.), 2 drms., £285.

Green Oil
Trelleborg, 100 cks., £215.

Naphthalene
Canton, 2 cs., £7.; Jamaica,
3 cs., £12.; Mombasa, 45 cks.,
£144.; Monte Video, 60 cs.,
£140.; Montreal, 40 cks., £130.;
Paris, 16 cks., £115.

Pitch
Alexandria, 60 brls., £120.;
Hong Kong, 400 bxs., £101.

Tar
Beira, 1 brls., £6.; Cape Town,
5 brls., £10.; Colombo, 100 brls.,
£154.

Terebine
Melbourne, 1 cs., £6.

COPPER SUBOXIDE—
Copenhagen, 10 drms., £102.

COPPER SULPHATE—
Bilbao, 6 c., £14.; Alexandria,
15 c., £35.; Constantinople,
1 t. 5 c., £58.; Seychelles, 2 c., £5.

CREAM OF TARTAR—
Bombay, 1 c. (F.), £28.; Karachi,
1 cs., (F.), £5.; Maceio, 1 cs.
(pt.), (F.), £5.; Pt. Elizabeth,
1 c., £15.; Pt. Moresby, 1 c. (F.),
£8.; Rio de Janeiro, 1 cs., £11.;
Salonica, 3 c. (F.), £31.

DISINFECTANTS (otherwise undes.)
Alexandria, 6 c., £30.; Antwerp,
11 c., £21.; Athens, 4 c., £22.;
Barbados, 4 c., £7.; Beira, 4 c.,
£15.; Buenos Ayres, 4 t. 11 c.,
£316.; Bombay, 13 t. 10 c.,
£763.; Brisbane, 2 t. 16 c., £130.;
Calcutta, 2 t. 11 c., £109.; Cocos,
2 c., £5.; Constantinople, 5 c.,
£25.; Copenhagen, 2 t. 1 c.,
£79.; Durban, 3 c., £12.;
Karachi, 4 t. 9 c., £192.; Lat-
akia, 3 c., £5.; Osaka, 2 t. 5 c.,
£105.; Paris, 9 t. 12 c., £250.;
Penang, 2 c., £22.; Perth, 4 c.,
£7.; Pt. Elizabeth, 12 c., £62.;
Pt. Said, 1 c., £14.; Shanghai,
10 c., £34.; Singapore, 5 c., £13.;
Sydney, 7 c., £28.; Vancouver,
1 c., £8.

ETHER—
Adelaide, 1 cs., £5.; East Lon-
don, 5 cs., £29.; Wellington,
1 cs., £44.

ETHER (METHYLIC)—
Canton, 1 cs., £15.

ETHYL CHLORIDE—
Malmo, 1 cs., £16.

FATTY ACID—
Bordeaux, £1,350.; Rouen, 7 t.
8 c.

FLUORIC ACID—
Sydney, 2 cs., £6.

FORMIC ACID—
Melbourne (F.), 90 cs., £598.;
Sydney (F.), 37 cs., £253.

FULLER'S EARTH—
Baltimore, 120 t.; Barcelona,
160 t.

GELATINE—
Pt. Elizabeth, 1 c.

GLUE—
Christiania, 3 t.; Lisbon, 10 c.;
Melbourne, 2 c.; Pt. Said, 10 t.
18 c.

GLUE, SIZE, AND GELATINE—
Antwerp, 10 t. 12 c.; Barran-
quilla, 1 c.; Bergen, 1 t.; Bom-
bay, 2 c.; Calcutta, 1 c.;
Canary Islands, 1 c.; Cape
Town, 4 c.; Christiania, 2 c.;
Cologne, 10 t. 7 c.; Constanti-
nople, 4 t. 5 c.; Copenhagen,
6 t.; Cyprus, 2 t. 6 c.; Freman-
tle, 5 c.; Ghent, 1 t. 2 c.;
Karachi, 3 c.; Montreal, 5 t.
18 c.; Rangoon, 16 c.; Shanghai
4 c.; Toronto, 5 t.; Wellington,
10 c.; Yokohama, 2 t. 10 c.

GLYCERINE—
Barranquilla, 3 c., £30.; Cal-
cutta, 4 c., £39.; Canton, 3 c.,
£22.; Paris (distilled), 5 t., £601.;
Pt. Said, 2 c., £16.; Tientsin,
1 cs. (pt.), £5.

HYDROCHLORIC ACID—
Alexandria, 2 c., £10.; Beira,
3 c., £12.; Beyrouit, 10 c., £30.;
Bombay, 3 c., £12.; Haifa, 3 c.,
£15.; Secondee, 7 c., £45.;
Shanghai, 5 cs., £17.

HYDROFLUORIC ACID—
Antwerp, 11 brls., £35.; Ade-
laide, 10 cs., £18.

HYDROGEN PEROXIDE—
Durban, 6 cs., 3 cs. (pt.), £61.;
Jamaica, 1 cs., £5.

HYPOPHOSPHITE OF LIME—
Sydney, 2 cs., £41.

IODINE (RESUBLIMED)—
Amsterdam, 1 cs. (pt.), £12.;
Singapore, 3 cs. (pt.), £12.;
Sydney, 2 cs. (pt.), £71.

**IRON AND AMMONIUM
CITRATE**—
Adelaide, 1 cs. (pt.), £6.; Amster-
dam, 1 cs., £19.; Constantinople,
1 cs. (pt.), £21.; Rotterdam,
2 cs., £166.; Shanghai, 1 cs.
(pt.), £8.; Stockholm, 1 cs., £53.

IRON GLYCEROPHOSPHATE
Trondhjem, 3 cs., £263.

IRON PERCHLORIDE—
Sydney, 2 cs., £8.

LACTIC ACID—
Melbourne (F.), 1 cs. (pt.), £38.

LEAD ACETATE—
Amsterdam, 1 cs. (pt.), £12.;
Bombay, 100 kgs., £338.; Cal-
cutta, 10 kgs., £45.; Demerara,
1 ck.; Fremantle, 6 kgs., £92.;
Genoa, 4 cks., £85.

LEAD NITRATE—
Genoa, 1 ck., £60.

MAGNESIA (CALCINED)—
Alexandria, 2 cs., £8.; Pernam-
buco, 1 cs., £14.; Santos, 3 cs.,
£59.

MAGNESIUM CARBONATE—
Boulogne, 40 bgs., £115.; Genoa,
23 bgs., £36.; St. John's, N.B.,
2 cs., £9.

MAGNESIUM CITRATE—
Bombay, 1 cs. (pt.), £7.

MAGNESIUM SULPHATE—
Aden, 2 c., £6.; Ascension, 2 c.,
£5.; Barranquilla, 10 c., £17.;
Bombay, 1 t. 2 c., £61.; Cal-
cutta, 5 c., £9.; Karachi, 3 c.,
£8.; Latakia, 6 c., £7.; Mel-
bourne, 2 t. 4 c., £84.; Monte
Video, 4 c., £6.; Rio Grande do
Sol, 6 c., £15.; Sierra Leone,
12 c., £27.; Sydney, 2 t. 2 c.,
£84.

MANGANESE BORATE—
Genoa, 5 cks., £162.

MANGANESE HYDRATE—
Rotterdam, 1 ck., £5.

MERCURY BICHLORIDE—
Constantinople, 1 cs., £79.;
Paris, 2 cs., £150.; Rotterdam,
6 cs., £356.

MERCURY CHLORIDE—
Odense, 1 cs. (pt.), £24.

MERCURY PERCHLORIDE—
Calcutta, 1 cs. (pt.), £9.

METHYL SALICYLATE—
Barranquilla, 1 cs. (pt.), £10.;
Amsterdam (F.), 1 cs., £14.;
Durban, 2 cs., £12.

MOLYBDIC ACID—
Paris, 2 cs., £191.

- NICKEL SULPHATE**—
Bilbao, 14 cks., £161.; Cologne, 20 cks., £260.
- NITRIC ACID**—
Beyrouth, 10 c., £23.; Alexandria, 1 c., £8.; Bombay, 2 c., £12.; Colombo, 5 c., £23.; Haifa, 1 c., £8.; Penang, 2 c., £13.
- OXALIC ACID**—
Barranquilla, 1 ck., £6.; Melbourne (F.), 3 kgs., £23.
- PARAFFIN WAX**—
Amsterdam, 18 c.; Calais, 2 c.; New York, 10 t.
- PARALDEHYDE**—
Sydney (F.), 1 cs., £15.
- PHOSPHORIC ACID**—
Fremantle, 2 cs., £20.; Paris, 50 crbys., £382.
- PHOSPHORUS**—
Brussels, 1 cs., £7.; Canton, 1 cs., £6.
- PHOSPHORUS AMORPHOUS**—
Alexandria, 2 cks., £31.
- PLUMBAGO**—
Bombay, 2 c.; Calcutta, 12 t. 10 c.; Cape Town, 7 c.; Durban, 3 c.
- POTASSIUM ACETATE**—
Bombay, 1 cs. (pt.), £5.; Calcutta, 3 cs. (pt.), £17.; Durban, 1 cs. £5.; Karachi, 1 cs. (pt.), £10.
- POTASSIUM BICARBONATE**—
Calcutta, 1 cs., £8.; Paris, 5 brls., £75.
- POTASSIUM BICHROMATE**—
Brisbane, 2 kgs., £19.; Constantinople, 1 kg., £19.; Athens, 1 kg., £13.; Fremantle, 1 kg., £9.; Melbourne, 3 kgs., £31.; Paris, 8 cks., £532.
- POTASSIUM BROMIDE**—
Bombay, 1 cs. (pt.), £8.; Calcutta, 1 cs., 1 cs. (pt.), £17.; Fremantle (F.), 3 cs. (pt.), £15.; Karachi, 1 cs. (pt.), £9.; Melbourne, 1 cs. (pt.), £8.; Sydney (F.), 1 cs. (pt.), £8.
- POTASSIUM CARBONATE**—
Alexandria, 1 cs. (pt.), £6.; Bombay, 1 cs., £10.; Maceio, 5 c., £14.; Rotterdam (F.), 39 t. 3 c., £3,383.
- POTASSIUM CHLORIDE**—
Brussels, 17 c., £123.
- POTASSIUM CITRATE**—
Calcutta, 1 cs., £29.; Melbourne, 2 cs., £62.
- POTASSIUM CYANIDE**—
Bombay, 2 c., £45.; Calcutta, 4 c., £45.; Shanghai, 1 cs., £14.
- POTASSIUM HYDRATE**—
Karachi, 1 cs. (pt.), £6.
- POTASSIUM IODIDE**—
Amsterdam, 1 cs., £150.; Barcelona, 2 cs. (pt.), £32.; Barranquilla, 1 cs. (pt.), £19.; Bombay, 1 cs. (pt.), £12.; Calcutta, 1 cs., £78.; Hong Kong, 28 cs. (pt.), £3.; Melbourne, 2 cs., £61.; Rotterdam, 1 cs. (pt.), 1 cs., £375.; Santiago (Chile), 1 cs. (pt.), £10.; Singapore, 3 cs. (pt.), £82.; Sydney, 1 cs., £41.; Wiborg (F.), 1 cs. (pt.), £38.
- POTASSIUM METABISULPHATE**—
Paris, 9 cks., £126.; Sydney, 1 cs. (pt.), £6.
- POTASSIUM OXALATE**—
Paris, 7 brls., £200.
- POTASSIUM PRUSSIAN**—
Barranquilla, 2 kgs., £38.
- POTASSIUM PERMANGANATE**—
Beyrouth, 1 brl., £44.; Karachi, 1 cs. (pt.), £5.
- POTASSIUM SULPHOGUAIA-COLATE**—
Santiago (Chile), 1 cs. (pt.), £12.
- PRUSSIAN BLUE**—
Boulogne, 1 kg., £12.
- PYROGALLIC ACID**—
Hong Kong, 1 cs., £8.
- QUININE**—
Alicante, 34 ozs.; Alexandria, 664 ozs.; Bombay, 1,000 ozs.; Calcutta, 2,150 ozs.
- SALICYLIC ACID**—
Auckland, 2 cs., £19.
- SALT**—
Auckland, 40 t.; Freetown, 5 c.; Madras, 2 t.; Pt. Elizabeth, 2 t.
- SALT CAKE**—
Ghent, 190 t. 13 c., £763.
- SALTPETRE**—

PRICES CURRENT.

THURSDAY, August 28, 1919

PREPARED BY MESSRS. HIGGINBOTTOM AND CO., 21, SPRING GARDENS, MANCHESTER.

The values stated are F.O.R. at makers' works, or at usual ports of shipment in U.K., unless otherwise specified.
The prices in different localities may vary

Acids:—

*Acetic, 40% and 60% per cwt.	31/- & 47/-
* " Glacial per ton	85 0 0
Arsenic, S.G. 2,000 per ton	70 0 0
Boric, Crystals per lb.	72 0 0
*Fluoric per lb.	0 0 7
*Muriatic (Tower Salts), 28° Tw. per carboy	0 6 6
*Nitric, 80° Tw. per ton	31 0 0
Oxalic per lb.	0 1 2½
Phosphoric, 1,750° per ton	0 1 9
*Sulphuric (fuming, 70%) per ton	—
* " (Pyrites, 168°) per ton	7 18 9
* " (" 140°) per ton	4 10 0
* " (free from arsenic, 144°) per ton	5 7 4
Tannic (commercial) per lb.	0 2 6
Tartaric (crystals) per ton	0 3 1
*Acetone per ton	80 0 0
*Alum, loose lump (delivered) per ton	17 0 0
Alumina Sulphate (pure) per ton	17 0 0
Aluminoferic (in slabs) per ton	8 10 0
Aluminium (Ingots Metal, 98/99%) per ton	150 0 0
*Ammonia, Anhydrous per lb.	0 1 10
* " *880 per ton	33 0 0
* " *920 per ton	20 0 0
" Carbonate per lb.	0 0 6½
" Muriate (grey) per ton	47 10 0
" " (sal ammoniac) 1st & 2nd, per cwt.	80/- & 75/-
" Nitrate per ton	60 0 0
" Phosphate per ton	110 0 0
" Sulphate (grey), London, net	—
" " Hull	—
" " Manchester	—
*Aniline Oil (pure) per lb.	0 1 2
Aniline Salt per ton	0 1 2
Antimony per ton	45 0 0
" (tartar emetic, 43/44%) per lb.	0 3 4
" (golden sulphide) per lb.	0 1 3
Arsenic, white powdered per ton	58 0 0
Barium Chloride (in casks) per ton	24 0 0
" Carbonate (native), 92/94% per ton	11 10 0
" Sulphate (native levigated) per ton	£7 to £14
Baryta Chlorate per lb.	0 1 3
*Bisulphide of Carbon per ton	55 0 0
Bleaching Powder, 35% per ton	15 0 0
* " Liquor, 7% per ton	6 0 0
Casein (commercial) per ton	85 0 0
Chromium Acetate (crystals) per lb.	0 1 6
Calcium Chloride per ton	8 0 0
China Clay (at Runcorn), in bulk per ton	70/- to 90/-

Coal-tar Products and Dyes:—

Alizarine (artificial), 20% per lb.	0 2 0
Magenta per lb.	18/- to 35/-
Anthracene, 40/50% A, f.o.b., L'don, per unit,	0 0 7
Benzol, 90's (naked) per gal.	0 2 0
" 50/90's per gal.	0 1 10
Carbolic Acid (crude, 60°) per lb.	0 1 6½
" (crystallised, 40°) per lb.	0 0 9½
" Acid (pale liquid, 97/98%) per gal.	0 2 9
*Creosote (ordinary), naked per ton	0 0 6½
*Crude Naphtha, 30% at 120°C. per ton	0 0 9
*Grease Oils, 18° Tw. (naked) per ton	6 10 0
Pitch, f.o.b., Liverpool or Garston per ton	2 16 6
*Solvent Naphtha, 90% at 160° per gal.	0 2 3
Copper per ton	99 0 0
" Sulphate per ton	43 0 0
" Oxide (copper scales) per ton	90 0 0
Dross Salts per ton	39 0 0
*Glycerine (crude), 80% per ton	72 0 0
* " (industrial, S.G. 1,260) per ton	110 0 0
*Iodine per oz.	0 1 0
*Iron Nitrate, 80° Tw. per ton	12 0 0
" Sulphate (copperas), delivered per ton	4 10 0
" Sulphide per ton	7 15 0
Lead (Foreign Pig) per ton	25 0 0
" Litharge Flake per ton	45 0 0
" Acetate (white) per ton	83 0 0
" (brown) per ton	71 0 0

Lead, Carbonate (White lead), pure per ton	£ 51 0 0
" Nitrate per ton	56 0 0
Lime, Acetate (brown) per ton	11 0 0
" (grey), 80% per ton	17 0 0
Magnesium Chloride per ton	15 10 0
" Carbonate (light) per cwt.	2 7 6
" Calcined Magnesite per ton	21 10 0
" Sulphate (Epsom Salts) (coml.) per ton	11 0 0
" (druggists) per ton	16 0 0
Manganese, Sulphate per ton	80 0 0
" Borate per ton	100 0 0
*Methylated Spirit, 64° (industrial) per gal.	0 5 7
*Naphtha (Wood), Solvent per ton	0 10 0
" " Miscible, 60° p. per ton	0 10 0

Oils:—

*Cottonseed per ton	135 0 0
*Linseed per ton	135 0 0
Stearine, 115-120° M.P. per ton	95 0 0
Potassium, Bichromate per lb.	0 1 6
" Carbonate, 80/82% per ton	95 0 0
" Chlorate per lb.	0 1 0
" Hydrate (Caustic Potash) 90% per ton	160 0 0
" " 75/80% per ton	140 0 0
" Potash Hydrate Liquid, 38° Bé per ton	70 0 0
" Nitrate (refined) per ton	60 0 0
" Permanganate (B.P. crystals) per lb.	0 3 5
" Prussiate (yellow) per ton	0 1 9
" (red) per ton	0 5 6
" Sulphate, 90% (ex ship) per ton	40 0 0
" Muriate, 80% per ton	30 0 0
Silver (metal) per oz.	0 5 1½
Sodium (metal) per lb.	0 1 3
" Acetate per ton	52 0 0
" Arseniate, 45% per ton	60 0 0
" Borate (Borax), Crystals per ton	39 0 0
" Bicarbonate (1 cwt. kegs) per ton	9 10 0

NOTICES.

All communications for the "Chemical Trade Journal and Chemical Engineer" should be addressed and Cheques and Post Office Orders made payable to—

DAVIS BROS., 265, Strand, LONDON, W.C. 2.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal and Chemical Engineer*—payable in advance, including postage, are as follows:—

	United Kingdom.	British Possessions and Foreign Countries.
Yearly (52 numbers)	19s. 6d.	24s.
Half-yearly (26 numbers) ...	10s. 6d.	13s.
Quarterly (13 numbers)	5s. 6d.	7s.

Subscribers, particularly those who bind their copies, are requested to renew their subscriptions immediately on receipt of expiry notice, as otherwise delivery will be stopped, and issues between expiry and renewal cannot be supplied.

The price of single copies is 6d. each, postage extra.

Our Registered Telegraphic Addresses are:—

"Trepex, London." "Expert, Manchester."

Our Telephone Numbers are:—

London: 13692, Central. Manchester: 3060, Central.

Our Manchester Address is Barton House, 66, Deansgate.

ADVERTISEMENTS.

Trade Advertisements, Announcements, in the Directory Columns, and Advertisements not prepaid, are charged at the Tariff Rates, which will be forwarded on application.

Advertisers would oblige by writing advertisements and letters of instructions on separate sheets of paper.

Communications for the Editor, if intended for insertion in the current week's issue, should reach the office not later than Wednesday morning.

Articles, reports, and correspondence on all matters of interest to the chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give their names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

Readers are invited to forward items of intelligence, company reports and balance-sheets, or cuttings from local newspapers of interest to the trades concerned.

CURRENT TOPICS.

SCIENTIFIC AND INDUSTRIAL RESEARCH.

THE fourth annual report of the Privy Council Committee for Scientific and Industrial Research, for the year 1918-19, gives an interesting account of the activities of the Department during the period under review—a period during which, to quote the words of the report, steady progress has been made with the formation and development of research associations. Up to now the work has been more or less of a pioneer character, but the manner in which the scheme has been welcomed by industry leads the Committee to assert that, so far as the Government are concerned, its success is assured. A number of research associations are already in existence, and others are in process of formation. Some time will elapse before the whole of the associations are in working order, and their influence is felt by the industries which they represent, but a vast amount of spade work has already been done, and the way cleared for some, at least, of the bodies to commence serious operations. As to the future of the research associations, this, as the Committee rightly point out, rests with the industries themselves. Beyond assisting in the task of creating the necessary organisation, and rendering financial assistance from the fund established by the Government for that purpose, the Department can do little to ensure the success of any particular research association that may be formed. As in all research work, results will depend largely upon the personnel of the research staff, who in turn will derive no little benefit from the encouragement they receive from the manufacturers on whose behalf the work is undertaken. Whilst a good many branches of industry have taken advantage of the scheme, others, for various reasons, have preferred to leave it alone. On the whole, these reasons may broadly be divided into two classes, and to a large extent they serve to explain why the heavy chemical industries have, from the inauguration of the scheme, held entirely aloof from it. In certain industries—explosives and dye manufacture are quoted as examples—where operations are conducted on a vast scale, and where control is very largely centralised,

research can be, and is, carried out very thoroughly without the necessity for recourse to the aid of a research association. In other cases—the heavy chemical industries are an outstanding example—the nature of the manufacturing processes is such as to render firms indisposed to joining an organisation the results of whose investigations become common property. This feeling of exclusiveness in some cases may possibly be modified as time goes on, but it is too deeply rooted in the chemical industries to be lightly swept aside. Two of the more recent associations are the British Photographic Research Association and the British Scientific Instrument Research Association, the latter of which has received exceptional financial terms, "because the industry falls wholly within the class of 'key' industries." This has led the Advisory Council to define what they understand is meant by a "key" industry—by no means an easy task, as they admit.

MANUFACTURE OF CALCIUM CARBIDE AND OTHER PRODUCTS IN INDIA.*

By DR. L. L. FERMOR.

LACK of detailed information prevents the setting forth of a definite scheme showing costs and possible profits, except in a very approximate manner. But such figures as are available suggest that there would be a considerable margin of profit on the manufacture of calcium carbide in India, in consequence of which it would probably pay to manufacture not only all the carbide required in India, but also other products manufactured from carbide—namely, the impure calcium cyanamide known commercially as nitrolim, and sodium cyanide. It is thought, however, that the Indian consumption of these materials may not be sufficient to justify the installation of an economic unit of plant. Consequently the proposal is made that the plant should be designed to produce 6,000 tons of carbide annually, which would be disposed of as follows:—

- 1,000 tons for sale in India,
- 1,000 tons for sale in Eastern Markets,
- 4,000 tons for transference to the cyanamide factory yielding 5,000 tons nitrolim to be utilised as follows:—
- 4,600 tons for sale as manure in India, Ceylon, Java, Sumatra, etc.
- 400 tons for conversion to sodium cyanide.

Four possible sites for such an industry are mentioned, two using electric power generated from Mond gas, and two using hydro-electric power. The site selected for investigation is Burhar, in Rewa State. The production here of 6,000 tons of carbide annually by the use of electric power generated from Mond gas, with recovery of ammonia as sulphate, would require:—

<i>Electric energy</i> —	£
4,000 k.w.-yrs. at £4.75 per k.w.-yr. (from 24,000 tons low-grade coal)	19,000
<i>For production of carbide</i> —	
5,800 tons of first-class coal at Rs. 6-8-0	2,513
4,711 tons of lime at Rs. 13-0-0	4,083
180 tons of electrode carbons at £15	2,700
<i>For production of cyanamide</i> —	
1,750 tons of liquid nitrogen—cost of production not known—original value nil	—
<i>For production of cyanide</i> —	
431 tons of salt (duty free) at £1.5 approximately ..	647
Total	£28,913

The quantity and approximate value of the products, annually, would be:—

2,000 tons of calcium carbide (80 per cent. CaC_2) at £13.5	27,000
4,600 tons nitrolim (20-22 per cent. N) at £12.2	56,120
825 tons sodium cyanide mixture—250 tons NaCN at £70	17,500
Total value of products	£100,620

It is very difficult to obtain reliable information on such matters, but from a careful analysis of the very imperfect data available, it seems likely that the capital outlay on the

cyanamide and cyanide plants would be about £50,000, and £5,000, respectively.† The total capital outlay required for the whole scheme would then be:—

Power plant	£101,000
Carbide plant	30,000
Cyanamide plant	50,000
Cyanide plant	5,000
Total	£189,000

On this basis the annual outlay would be, roughly:—

Cost of energy	£19,000
Cost of materials	9,943
Labour and administration	12,000
Depreciation at 10 per cent. on £85,000	8,500
Repairs and renewals at 3 per cent. on £85,000	2,550
Packing in drums 2,000 tons of carbide and 825 tons of cyanide mixture at £1.5 per ton	4,238
Packing in bags 4,600 tons of nitrolim at £0.5 per ton	2,300
Loss in dust (carbide)	1,050
Total expenditure	£59,581

Value of products	100,620
Therefore, profits	41,039
To this must be added 5 per cent. interest on capital cost of power plant (£104,000) included in cost of power	5,200
Total profit	£46,239

The above figures show a profit of 48 per cent. on the capital cost of the chemical plant alone, or of 24 per cent. on the total cost of chemical and power plants. The data on which this estimate is based are admittedly inadequate, but the figures are probably approximately of the right order, and the amount of profit shown leaves an ample margin for such charges as interest on cost of acquisition of land, for increased cost should this enterprise be undertaken under abnormal conditions, or for decrease in the value of the products after the war should there be cutting of prices due to over-production in Europe. The figures, however, are sufficiently encouraging to show that the scheme outlined in this note is worthy of serious investigation by duly qualified people.

In this note no consideration has been given to the further industries dependent upon nitrolim or calcium cyanamide as raw material—viz., the manufacture of ammonia from cyanamide, with conversion into ammonium sulphate, nitrate or phosphate for use as fertilisers, and the further oxidation of ammonia to nitric acid by one of the Ostwald group of processes for the provision of the nitric acid required in such large quantities in the manufacture of explosives, amongst which ammonium nitrate may be mentioned.

Before any such scheme as that outlined in this note can be carried out, very careful consideration will have to be given to the competitive effects of ammonium sulphate obtained as a by-product from coke ovens, and via the Haber process.

It is only necessary to make a passing reference to the industries dependent upon cheap supplies of acetylene derivable from calcium carbide, such as the manufacture of acetic acid and acetone, and the use of the oxy-acetylene flame for welding, liquid oxygen suitable for this purpose being obtained as a by-product in the manufacture of calcium cyanamide.

Should the scheme here outlined be subsequently supplemented by the plant necessary for the production of ammonia and nitric acid, we should be providing India with a very desirable Janus-like or double-faced scheme capable of providing fertilisers in times of peace and explosives in times of war.

ELECTRICAL PRECIPITATION OF TAR FOG.—The removal of tar fog from coal gas is a troublesome operation, but is very essential, in the direct ammonia process. According to a communication presented by G. Davidson to the Canadian Mining Institute, the Cottrell process of electric precipitation is quite able to deal with the crude gases produced in the distillation of coal, wood, and petroleum, even at the high temperatures used in modern industrial processes, whilst the usual methods of tar fog removal in extractors require cooling of the gases. Davidson obtained cleaner distillates with electric precipitation than formerly. The treater chamber he used consisted of an iron pipe, 15ft. high and 12in. in diameter, provided with fused quartz insulators; he passed about a million cub. ft. of gas through his heater per day, and his heater requires about 2H.P. or 3H.P.

* Indian Munitions Board Handbook, 1919.

† Judging from information received since this note was written, the scale of operations suggested is too small, and should be at least twice as extensive. This would mean a greater reliance on export to commence with.

‡ The estimates of capital costs are presumed to be on a pre-war basis.

PACKING OF CHEMICALS FOR SHIPMENT.*

By C. P. BEISTLE.†

NO argument is necessary to show the absurdity of concentrating the efforts of efficiency engineers on minimising manufacturing costs and getting maximum yields in a manufacturing plant without utilising the same talent in the protection of these manufactured products from loss during transportation. The problem of securing safe transportation involves numerous factors. The nature of the material to be shipped must be considered with respect to the results liable to follow from leakage from shipping containers. In some cases only the loss of the material is involved, while in others disastrous fires, involving the loss of much additional property, may result, either by the effect of the exposure of leaking material to air and moisture, or by ignition of inflammable material. In some cases the material shipped is liable to act chemically on the container. The nature of the material shipped and the design and construction of the container must be considered also from the standpoint of safe storage of the article, as well as safe transportation of it by rail. In many cases deterioration of containers during storage has a direct effect upon the safety of subsequent transportation of the package. The mechanical engineer who designs shipping containers must appreciate the stresses that are liable to act on his container during transit, and the loading and bracing of these containers in a freight car must be scientifically planned and executed. The amount of material packed in a container has an important influence also on the design of the container. Finally, the various factors calling for a maximum of strength and endurance must be analysed against the permissible costs. In settling the permissible costs we must consider whether the package is designed for one journey or for continued use. In many cases the expensive package is the cheap one, the saving being due to its long life and continued service.

Steel Barrels and Drums.

The specification steel drum required for inflammable liquids serves the purpose admirably; failures in this container generally result from too long service, porous bungs, or improper gaskets. It is a fact not generally known that ordinary cast-iron bungs in noticeable proportions are sufficiently porous or flawed to permit leakage through the metal. This is more noticeable with light and volatile liquids, such as gasoline or ether. The remedy is to use steel bungs, or to subject all cast-iron ones to severe test for porosity before use.

Difficulties with these metal drums may be divided into three classes: First, poor welding; second, closing devices; and third, corrosion and rough handling.

Poor welding can ordinarily be controlled only by the most careful supervision of the manufacturer. An air test of 15lb. is prescribed for each package, but small holes may be covered with scale or closed by oxide, so that leakage will develop after use. Such a test made before each shipment, especially if the package is hammered with a wooden mallet along the chime and side weld, would eliminate practically all chance of leakage due to defective welding. The apparatus and test would not be very expensive, and would probably pay in the case of a large shipper, for the railroads are fast coming to the conclusion that claims on leaking packages should not be paid unless injury actually occurs in transit. A small shipper can get fair results by laying the package on its side after filling, and allowing it to remain for several hours, and examining for leakage while hammering with a wooden mallet along the chime and side weld. Repairing of leaks by soldering does not pay in the long run, and should not be allowed. They should be welded.

The efficiency of closing devices can be easily controlled by the purchaser, even if the manufacturer is careless. All that is necessary is a careful and intelligent inspection of packages upon receipt, and the use of a new gasket at each shipment. Bungs when screwed in about three-quarters of the distance should show a fairly close fit in the threads, otherwise they will soon strip. The thread in the bung-hole should have at least five complete threads, and that on the bung should be sufficiently long to engage in all of the five threads in the bung-hole. Bungs should screw up to an even bearing when gaskets are removed. Gaskets should be at least $\frac{1}{8}$ in. thick by $\frac{1}{2}$ in. wide.
